If the Illinois EPA were to consider including this information in the planned revised CAAPP permit, other relevant considerations would need to be taken into account such as: 1) the quality and source of the information, 2) whether the facts are disputable, 3) any defenses available to the source and 4) the nature of any disputed legal arguments. These factors may not be readily discernable at this early stage and would need to be considered within the constraints of the CAAPP permitting process. Section 39.5 of the Act and 40 CFR Part 70 do not contemplate this type of judicial review in the context of CAAPP or Title V permitting and do not provide the requisite authority to proceed with such

investigation. As such, Illinois EPA must consider the potential impact that enforcement and permitting have on one another. Where there is a pending or active enforcement case at the same time as a permitting action, the source and the State of Illinois or United States could easily find themselves litigating the same matters in different venues with the risk of different and conflicting results.

Therefore, while nothing in the Act would typically prohibit the Illinois EPA from including a compliance schedule in an initial permit or a renewal to a permit for the issues generally addressed in the current enforcement cases, as discussed above, an initial question that presents itself is whether the inclusion of a compliance schedule is mandatory, particularly when such information is available before the matter has been adjudicated and required actions to achieve compliance have yet to be resolved between the source and the enforcement authority. USEPA has stated, in a number of petition responses regarding this topic of discretionary versus mandatory compliance schedules, it is entirely appropriate for the permitting authority to allow an enforcement case to take its course and to wait to see whether an order results. At that time, the Title V permit may be reopened to include a compliance schedule.

For the VN issued by the Illinois EPA on November 30, 2012, there is an additional subject that must be considered for the alleged violations of the NOx and VOM limits for the BOF ESP. On January 31, 2013, the Illinois EPA received a proposed compliance schedule from US Steel for these violations. However, the Illinois EPA is not required to include this compliance schedule proposed by US Steel in the planned revised permit because it was not considered by USEPA in its action on a petition to object. The scope of the present permit proceeding is narrow. As set forth in the CAAPP, if a petition objecting to a CAAPP permit is granted by USEPA after the permit has already been issued, the Illinois EPA is authorized to revise the CAAPP permit in response to USEPA's order. *See generally,* Section 39.5(9)(e)-(g) of the Act. These provisions do not require a source to submit an appropriate, complete application as would be required under Section 39.5(5)(d) for the Illinois EPA to issue a new or revised CAAPP permit in circumstances where the Illinois EPA is not responding to a USEPA order. Indeed, Section 39.5(9)(g) specifically provides that a source will not be in violation of the requirement to have submitted a timely and complete application when the Illinois EPA is acting in response to a USEPA's objection.[15]

In addition, the proposed compliance schedule submitted by US Steel addressed violations that are at an early stage in the larger enforcement process of determining whether a violation has, in fact, occurred. As discussed above, additional exchanges that are part of Illinois' Section 31 process have yet to occur. US Steel has not yet had an opportunity to submit additional information in rebuttal to the alleged violations consistent with Section 31. Only after gathering such additional information will the Illinois EPA be able to weigh the quality of the information, disputed facts, any defenses available to the source and the nature of any disputed legal arguments.

Based on all the foregoing, it is the Illinois EPA's preliminary decision to wait until the enforcement cases identified above have been resolved and/or adjudicated before including any compliance schedule in a CAAPP permit for the

[15] This is likely due to the time constraints facing a permitting authority when seeking to revise a permit to comply with a USEPA order. While the CAAPP does not set a time-frame for making such revisions, federal requirements provide that a permitting authority must act within 90 days to address a USEPA order that grants a petition for review.

facility. In the meantime, Condition 9.1.4 would remain in the planned revised CAAPP permit, which provides that any permit shield or the revised CAAPP permit, itself, may not be used as a defense during any enforcement proceedings and that the requirements of any compliance schedule will be complied with at the appropriate time.

With respect to US Steel's recently submitted compliance schedule, the Illinois EPA intends to initiate the processing of US Steel's proposed compliance schedule as a significant modification to the CAAPP permit, in accordance with Section 39.5(14)(c)of the Act. That permitting action would potentially involve the incorporation of a yet-to-be finalized compliance schedule that would address violations of certain emission limits for the BOF. As provided by the Act, the CAAPP's procedures for significant modification must by used for "applications requesting significant modifications and for those applications that do not qualify as either minor modifications or as administrative permit amendments." A modification of a permit to include a compliance schedule would commonly be considered "significant." Section 39.5(14)(c)(i) and (ii) of the Act. As a significant modification, the modification of the CAAPP permit would be subject to requirements for public participation followed by review by USEPA in accordance with Sections 39.5(8)(a) and (9) of the Act rather than a 10-day comment period as provided for by Section 39.5(9)(g) of the Act.

III. Periodic Monitoring to Ensure Compliance with Certain Emission Limits

USEPA Order

In Section I.B-D of its Second Order, the USEPA found that the Periodic Monitoring Requirements in the current CAAPP permit for certain emission limits in the permit are inadequate. Most critically, the USEPA found that these requirements were deficient because they were not preceded by preparation of a listing of the emission factors that US Steel would initially use to determine compliance with the subject limits, with supporting information available, which would enable the public and USEPA to provide meaningful comments on these emission factors. USEPA also found that the supporting explanation for this Periodic Monitoring provided by the Illinois EPA in the record for the current permit was insufficicent.

As a consequence, USEPA instructed the Illinois EPA to correct these deficiencies in the permit and its development, as follows.

> The IEPA must determine and adequately support a mechanism to determine compliance with the applicable emission limits in Conditions 7.1.6(b)(i) - (iv), 7.4.6(b) - (f), 7.5.6 (c) - (g), and 7.6.6(a) - (e). IEPA must include in the permit itself the monitoring methodology for determining compliance with these limits. If using emission factors, IEPA must propose the actual emission factors in the permit or supporting permit record, and provide supporting documentation for the accuracy and appropriateness of those emission factors, such as historical source test data or other available information. If source test data are not readily available for a specific emission unit, as IEPA asserts, other sources of emission factors (including published literature and material and energy balances) must be reviewed and cited for acceptable emission factors prior to issuing the permit.
>
> For the reasons provided above, I grant this claim and direct IEPA to specify in the permit and make available for public comment the emission factors or equations that USGW initially intends to use to demonstrate compliance with emission factor limits and maximum emission limits contained in the permit conditions identified by the Petitioner, including a clear explanation of how the emission factors will be used to determine compliance. IEPA should also specify in the permit and make available for public comment a provision on how the emission factors or equations will be updated as new emissions information becomes available for the affected operations. Alternatively, IEPA must specify an alternative periodic monitoring methodology in the permit that is adequate to demonstrate compliance with the permit limits cited by the Petitioner. Second Order, p. 12

The Illinois EPA is now proceeding as directed by USEPA in its Order, with the intent of issuing a revised permit that includes additional provisions, as required by the Order, related to the emission factors and the procedures that US Steel would use to demonstrate compliance with the subject emission limits.

Background

CAAPP permits must address emission limits set in preconstruction permits issued under regulations approved by USEPA in accordance with Title I of the

Clean Air Act (CAA) as such limits are considered "applicable requirements."[16] Preconstruction permits, commonly referred to in Illinois as construction permits, derive from the New Source Review ("NSR") permit programs required by Title I of the CAA. These programs include the two major NSR permit programs: 1) the Prevention of Significant Deterioration ("PSD") program,[17] and the nonattainment NSR program.[18] These programs also encompass state construction permit programs for projects that are not major.

The USEPA's Second Order addresses a number of emission limits that were carried over or incorporated into the CAAPP permit from Construction Permit/PSD Approval 95010001. This permit was initially issued in January 1996, to National Steel, the former owner of the Granite City Works. This permit addressed an expansion project that included increases in the production of iron from the two existing blast furnaces at this steel mill and an increase in the production of steel from the two existing BOP furnaces. The permit provided approval to undertake the project pursuant to state laws and rules governing construction and modification of sources of emissions, including the nonattainment NSR program and the PSD program.

To implement the major NSR permit programs, Illinois' construction permits must commonly include limits on the amounts of different pollutants emitted by the new or modified emission units that comprise the proposed projects addressed by the permits, defining their permitted emissions.[19] This is the case for Permit 95010001. As a general matter, the Periodic Monitoring required by the current CAAPP permit for limits on emissions established in Permit 95010001 would be provided by the Monitoring that would be required for the subject emission units related to applicable regulatory standards and other emission control requirements, together with specific recordkeeping related to their actual emissions. Emission factors would be used to determine actual emissions, with records required for the emissions factors[20] that are used to determine

---

[16] *See* definition of applicable requirements in Section 39.5(1) of the Act.

[17] The federal PSD program, 40 CFR 52.21, applies in Illinois. The Illinois EPA administers PSD permitting for major projects in Illinois pursuant to a delegation agreement with USEPA.

[18] Illinois has a state nonattainment NSR program, Major Stationary Sources Construction and Modification ("MSSCM"), 35 IAC Part 203, pursuant to state rules, that have been approved by USEPA as part of Illinois' SIP.

[19] In Illinois' NSR permit program for non-major or "minor" projects, the amounts of pollutants that are permitted to be emitted or the "permitted emissions" from projects must be addressed during permitting. This is because the applicability thresholds for the major source NSR programs are based on annual emissions of proposed projects, in tons per year. Accordingly, construction permits for proposed projects commonly include emissions limits that establish or memorialize the permitted emissions of the various new and modified emission units that are involved in projects. These permitted emissions then serve in place of the "theoretical" potential emissions of a project when addressing NSR applicability.

Illinois' major NSR permits also have limits for the permitted emissions of the different units that comprise a project. Rather than addressing applicability of NSR, these limits serve to implement the substantive requirements of NSR, as the amount of emissions for which different emission units are permitted is a critical element of the analyses that must precede the issuance of a permit for a proposed major project.

[20] In this Statement of Basis, the term "emission factor" is generally used with its common meaning. That is, an "emission factor" is a set value for the mass of a pollutant emitted by a particular emission unit relative to the amount of material that is processed or handled by the unit, which value is generally representative of the operation and emissions of the unit.

emissions and for the "throughput" of the units (i.e., the amount of material handled by these units or hours of operation).[21] Recordkeeping would also be required for the determination of the annual emissions, for comparison to the applicable permit limits for annual emissions. The Periodic Monitoring for the operation of the subject emission units as related to other applicable requirements would verify proper operation of the units and serve to confirm that established emission factors for such units are appropriately used to determine the amount of emissions. The presence of limits on the amount of emissions from such units generally does not necessitate additional or more frequent Monitoring for the operation of these units. As emissions of the units would be calculated using emission factors, the other information needed to determine actual emissions is their throughput or amount of material that is handled, with the actual emissions being the product of the applicable emission factor and the throughput or activity of a unit. The Periodic Monitoring specifically for permit limits on the amount of emissions would entail the necessary records for the throughput of the subject units. The Monitoring would also include recordkeeping for the calculated emissions, as needed for direct comparison to the established permit limits.

When emission factors are used to determine emissions, the critical element is the factors that are selected for use. The current CAAPP permit requires the Permittee to keep a file containing the emission factors that it uses to determine actual emissions for purposes of determining compliance with the subject permit limits. These records must also include the basis or supporting documentation for the selected factors. This assures that the selected emission factors are memorialized in writing, along with the factual basis for the emission factors. This makes the relevant supporting information available to the Illinois EPA personnel as well to the source's staff, both present and future, for their review and use. The current permit also accommodates changes to "established" factors by the source if new information may become available.[22] Changes to these "established" emission factors would also be required to be documented, with explanation and supporting data, and linked to a particular date.[23] A change to the established emission factor that the source uses would be mandatory, with adoption of a new established emission

---

For purposes of this discussion, an emission factor may also be a set value for the maximum hourly emission rate of a unit. In such case, the annual emissions would be determined from that emission rate and the actual operating hours of the unit.

[21] The emissions of the subject emission units cannot be determined by "material balance." For example, the emissions of sulfur dioxide (SO_2) from the units do not result from use of a fuel, where, absent add-on control equipment or the presence of sorbent material in the flue gas, SO_2 emissions can be calculated from the sulfur content and usage of fuel.

[22] The simplest example of circumstances in which an established emission factor must be reevaluated is the performance of emission testing for the emission unit that is subject to the permit limit. Other circumstances would include emission testing of similar emission units, as might occur either at the facility or at other units operated by US Steel, when testing at those other units was the basis of the current factor. Established emission factors would also have to be reevaluated if USEPA revises its *Compilation of Air Pollutant Emission Factors*, AP-42, and that document was the basis of the current factor.

[23] The date that the emission factor used for a particular unit is changed may be significant. A change in an emission factor can result from a change in an emission unit or associated control equipment or control practices, so that the new emission factor would supersede the former factor on the date when the underlying change to the unit was made. A change in an emission factor can also reflect the availability of new information and better data. In such case, a change to the emission factor may have implications for the emissions of the unit, especially if the former emission factor understated actual emissions of a unit.

factor, if it is determined that the current emission factor would understate actual emissions.[24,25]

This approach to Periodic Monitoring for the subject emission limits is dictated by the nature of the affected emission units and the available methodology to determine the actual emissions of these units. It is also consistent with the basis by which these limits were established in the underlying permit, as they were developed using emission factors. It is not feasible or practical to conduct direct monitoring of emissions to determine compliance with the subject permit limits nor would it be reasonable to do so even if feasible.[26, 27] This is particularly true as limits are established that address uncaptured emissions or fugitive PM, as defined by 35 IAC 211.2490, such as the limits established for the roof monitor of the BOF shop. Stacks are not present as are essential for instrumental emissions monitoring. Fugitive PM emissions are routinely determined using established emission factors. Proper operation of these units and their associated control devices can be readily verified by much simpler methods. In addition, the permit limits for emissions of PM and other pollutants were generally developed from data that was considered to represent the emission rate or emission factor that would be present when a unit and its associated control measures would be operating properly.

---

[24] A particular emission factor would understate actual emissions if the actual emissions would in reality be greater than would be calculated using such factor. For example, consider a unit that processes 5,000 tons of material annually. The actual or "true" emission rate of the unit, as measured by properly conducted testing, which testing continues to be representative of the operation of the unit, is 0.25 pounds/ton. If a higher emission factor, e.g., 0.40 pounds/ton, were used to calculate actual emissions for the purpose of determining whether this unit complies with a subject limit, the use of such factor would be acceptable. This is because the result would not understate actual emissions. Using a factor 0.40 pounds/ton, the calculated annual emissions would be 1.0 ton (5,000 tons x 0.40 lb/tons ÷ 2,000 lbs/ton = 1.0 ton). This is greater than the "true" emissions that would be calculated with the emission rate measured by testing, 0.625 tons (5,000 tons x 0.25 lb/tons ÷ 2,000 lbs/ton = 0.625 tons). However, the use of an emission factor that is lower than the measured rate, e.g., 0.20 pounds/ton, would understate actual emissions of this unit. The emissions calculated using a factor of 0.20 pounds/ton would be only 0.50 tons. Since this factor would understate the actual emissions of the unit, the use of such a factor would not be appropriate.

[25] The relevant criterion for a mandatory change to an established emission factor is if the factor understates actual emissions. The permit would not preclude use of emission factors that overstate actual emission factors. In particular, the source need not adjust the established emission factor after every emission test if the established emission factor has conservatively been set at a level above all the test results, e.g., at the level of the applicable emission standard.

[26] Monitoring for the mass of emissions (e.g., emissions in pounds per hour), as needed to determine compliance with emission limits set by construction permits, is more complicated than emissions monitoring. It entails not only measuring the concentration of a pollutant or loading in the exhaust but also monitoring for the flow rate of the units, as needed to determine the mass of emissions of a pollutant.

[27] As stacks are present on units that are subject to limits, technologies and procedures have not been developed for the use of continuous PM emissions monitoring systems on those units. As a technical matter, an essential prerequisite for any such PM monitoring, which is not yet satisfied for continuous PM monitoring, would be a demonstration that available monitoring technologies can be operated and maintained to provide reliable information on PM emissions when applied to the exhaust of the unit. Moreover, even if continuous PM monitoring were feasible, the effort entailed in applying current continuous PM monitoring methods, which have been developed for use on large coal-fuel fired boilers, to the subject emission units would be excessive.

As such, it is appropriate for the Periodic Monitoring for these permit limits on emissions to focus and rely upon the Monitoring to verify proper operation of units and their control equipment. This is provided by the Periodic Monitoring that would be provided for the regulatory emission standards and other control requirements that apply to the units. This Monitoring would require appropriate combinations of inspections, observations, emission testing and recordkeeping to verify the proper operation of different units as related to control of their emissions. As emission testing would be required as part of that Monitoring, it would also provide confirmation that the emission factors being used by the source to address emissions of a unit for purposes of emission limits are suitable and do not understate the actual emissions of the unit. This approach to Periodic Monitoring for emission units subject to permit limits on the amount of emissions, relying upon emission factors, production rates, and control efficiencies has previously been upheld by USEPA. *See* Order Responding to Petitioner's Request that the Administrator Object to Issuance of State Operating Permit, In the Matter of East Kentucky Power Cooperative, Inc. (USEPA, Dec. 14, 2009); (where USEPA reasonably relied on emission factors along with recordkeeping to demonstrate compliance with emission limitations).[28]

It should also be clearly understood that certain subject limits pose particular concerns for Periodic Monitoring that that are not present when requirements are developed by rulemaking. This is because of the nature of NSR, which necessitates that construction permits set certain emission limits that are very different from emission standards that are established by rulemaking. Rulemakings are generally focused on regulating or controlling the emissions of particular pollutants from a particular category or categories of emission units. During rulemaking, the emission units that will actually be subject to regulation may be considered and the scope of regulation may be adjusted. The emission standards that are finally adopted will consider the nature of the emissions from the units, how they might appropriately be controlled and in what terms emission standards should be set.[29] By contrast, the scope of construction permits is set by the emission units that will comprise the particular projects and the provisions of the NSR programs, which act to dictate that quantitative emission limits must be set for those units in the construction permits. Accordingly, because of the nature of construction permitting, certain terms and conditions in these permits may pose issues for Periodic Monitoring that are not present for applicable requirements that were developed by rulemaking. Construction permits must set limits for certain emission units for which testing of emissions is not feasible or impractical. Most significantly, limits must be set for certain emission units that lack

---

[28] It should be recognized that this approach to the subject permit limits does not decouple the ongoing Monitoring for such limits from the actual operation of such units. This is because the appropriate emission factor used to determine actual emissions can differ based on how a unit is operated. For example, if the normal emission factor for a unit is predicated on control of PM emissions and the unit operates during a period when the capture system is damaged, it is appropriate for the emissions during such period to be calculated using a higher factor that accounts for the actual condition of the control system during such period.

[29] For example, the NESHAP for Integrated Iron and Steel Manufacturing, 40 CFR 63 Subpart FFFFF, regulates uncaptured emissions of particulate matter from units at BOF shops with standards that address the opacity of those emissions. This NESHAP does not set quantitative standards on the amounts or mass of particulate emissions, in pounds per ton of steel processed or the concentration of particulate in the exhaust, in gr/scf. This NESHAP also does not address emissions of pollutants other than particulate, such as NO_x or SO_2, from units at BOF shops.

stacks, for which it is not possible to obtain measurements of exhaust or air flow rates to measure the mass of emissions. Limits must also be set for uncaptured emissions from certain units, which bypass the stack, for which measurements of emissions are also not possible. Limits may also be set for certain units for which the emissions are negligible, either in absolute terms or relative to the emissions of the principal units and emission streams at a facility.

Planned Action 1

The Illinois EPA must determine and adequately support a mechanism to determine compliance with the subject emission limits in the permit.

The use of "emissions factors" is generally an appropriate mechanism to address compliance with these emission limits. As already explained in the above discussion concerning the establishment of emission limits in construction permits, as a consequence of NSR, construction permits contain emission limits for emission units that do not have stacks. For these emission limits, direct measurement of emissions is not feasible. For emission units that do have stacks, construction permits also contain emission limits for which continuous compliance determination methods for emissions are neither feasible nor practical. In such circumstances, compliance with these emission limits set by the construction permit must be determined from values for actual emissions that are calculated using "appropriate" emission factors. For an emission factor to be appropriate, it must be representative of the actual operation and emissions of the unit whose emissions are being quantified. If source-specific emission testing is conducted for the unit, a "site-specific" emission factor must be used considering the results of that testing, instead of a "generic" emission factor, like the factors in USEPA's *Compilation of Air Pollutant Emission Factors*, AP-42. Since compliance is being determined with an emission limit, the emission factor that is being used must not understate the actual emissions of the unit. As further testing is conducted for a unit or other new information relevant to emissions of the unit becomes available, the emission factor that is being used for the unit must be reviewed to assure that it is appropriate and the factor updated if necessary.

The use of appropriate emission factors to determine compliance with permit limits on emissions in this manner is a well established practice. It does not act to shield an emission unit from other applicable requirements that apply to the unit. In particular, emission units must continue to comply with applicable emission standards and operational requirements, with proper operation and maintenance of units and their controls as necessary to comply with those requirements. The use of emission factors also does not preclude event-specific determinations of emissions for units as necessary because the established emission factors are not appropriate to address particular events. In this regard, the use of emission factors in this manner does not nor could it preclude the use of other credible evidence by the Illinois EPA or others to address US Steel's compliance with the subject limits. As related to use of emission factors to determine compliance with subject limits on emissions, it is significant that the Order has not suggested that use of emission factors in the manner set forth by the current CAAPP permit is not appropriate.[30] Rather, the Order identifies deficiencies in the procedures in the current permit that accompany the use of emission factors, as relevant to assuring that US Steel is

[30] It is also noteworthy that USEPA has not identified an alternative approach to these emission limits that would not rely on use of emission factors.

using appropriate emission factors and the roles of the Illinois EPA, USEPA and the public in these procedures.

Planned Action 2

The Illinois EPA must include in the permit itself the monitoring methodology for determining compliance with the subject limits. If emission factors, the Illinois EPA must propose the actual emission factors in the permit or supporting permit record and provide supporting documentation for the accuracy and appropriateness of those emission factors, such as historical source test data or other available information. If test data is not readily available for a specific emission unit, other sources of emission factors, including published literature, must be reviewed by the Illinois EPA and cited for acceptable emission factors prior to issuing the permit.

The revised CAAPP permit that the Illinois EPA now plans to issue would include the monitoring methodology for determining compliance with these emission limits, with additional enhancements to the methodology as directed by USEPA. (See new Condition 5.13 in the draft of the revised permit.) The record for the planned revision of the permit includes the documentation that currently supports the emission factors that US Steel is presently using to determine compliance with the subject limits. Emission testing that has been conducted for the affected units provides the support for the accuracy and appropriateness of many of the emission factors. For these limits, the relevant emission tests are identified in the record, along with the actual rate of emissions measured by the test. This testing generally shows that the actual emissions are well below the relevant emission factor.[31] The Illinois EPA has also reviewed available supporting data for emission factors for the specific emission units for which emission testing is not feasible or practical. The information supporting each emission factor is identified in the attachment to this Statement of Basis. Additional supporting information is included in the permit record for revision of the CAAPP permit that is now planned. For emission units for which emission testing is conducted, the relevant emission tests that have occurred are identified, along with the measured emission rates. For units for which testing is not conducted, the basis of the emission factor is provided, including a citation to relevant provisions of published documents.

Planned Action 3

The Illinois EPA must make available for public comment the emission factors that US Steel initially intends to use to demonstrate compliance with the subject emission limits.

The revised CAAPP permit that the Illinois EPA now plans to issue would include a listing of the emission factors that US Steel is currently using to determine compliance with the subject limits. (See new Attachment 3 in the draft of the revised CAAPP permit.

[31] As previously discussed, emission testing conducted during 2012 pursuant to the current CAAPP permit showed actual rates of NOx and VOM emission from the ESP for the BOP furnaces that are greater than the rate of emissions in the permit and the emission factor that US Steel was using to determine compliance with the relevant limits for these pollutants. As a consequence, US Steel has submitted a proposed compliance schedule for these two limits, which the Illinois EPA will be processing as an application for a significant modification to the CAAPP permit for the Granite City Works, separate from the planned revision to the current CAAPP permit pursuant to USEPA's Second Order.

Planned Action 4

The Illinois EPA must specify in the permit and make available for public comment a clear explanation of how the emission factors will be used to determine compliance.

The revised CAAPP permit that the Illinois EPA now plans to issue would include the required explanations in planned Conditions 5.13, which would contain new procedures related to US Steel's use of emission factors to determine compliance with the subject emission limits. As the standard for an acceptable emission factor is that it not understate actual emissions, this would now be explicitly stated in planned Condition 5.13(a). As already explained, it is a fundamental aspect of these emission factors that they not understate actual emissions. This is because they are being used for the purpose of determining compliance with emission limits. The relevant recordkeeping provisions in the current CAAPP permit related to these emission factors already require that they not understate actual emissions.[32] However, it is appropriate for this requirement be reiterated in Condition 5.13(a) since Condition 5.13 would be added to the CAAPP permit generally dealing with US Steel's use of emission factors for the subject limits.[33]

Planned Condition 5.13(b) would explain how emission factors are to be used by US Steel to determine compliance with the applicable limits. Most importantly, the actual annual emissions of the subject emission units would be calculated using the relevant emission factors for comparison to the subject annual emission limits to determine compliance. However, if more refined calculations are needed to appropriately quantify the actual annual emissions of a unit, the calculation of the annual emissions of the unit would not be constrained to the use of a single emission factor. If US Steel has developed different factors for different modes of operation of an emission unit, the annual emissions of the unit would be determined as the sum of the emissions for each mode of operation. Also, if there are additional emissions that are not accounted for by the established emission factor(s), these "additional emission" must also be included in the calculation of actual emissions.[34] Thus, the established emission factors are merely a technique that US Steel must use to facilitate its calculation of annual emissions for purposes of determining compliance with the subject limits on annual emissions.

Planned Action 5

The Illinois EPA must specify in the permit and make available for public comment provisions setting forth how the emission factors will be updated as new information becomes available for the subject units.[35]

---

[32] *See* Conditions 7.1.9(h)(i), 7.4.9(i)(i), 7.5.9(f)(i), and 7.6.9(c)(i).

[33] This provision will also further confirm that when US Steel is demonstrating compliance with one of the subject limits, it cannot simply "…select whichever emission factor appears to demonstrate compliance," as erroneously suggested by USEPA in the Second Order.

[34] The occurrence of events that result in additional emissions, which are not adequately addressed by the relevant emission factors that have been established by USEPA, is already contemplated by the current CAAPP permit. The current CAAPP permit requires records for periods of events that would potentially be accompanied by such additional emissions, which records must also include estimates of the amount of such additional emissions during such periods. *See* Conditions 7.1.9(h)(ii), 7.4.9(i)(ii), 7.5.9(f)(ii) and (g), and 7.6.9(c)(ii).

[35] While the Second Order would also accommodate use of "alternative periodic monitoring

The revised CAAPP permit that the Illinois EPA now plans to issue would include additional provisions required by the USEPA's Second Order. (See Conditions 5.13(c), (d) and (e) in the draft of the revised permit.)

Planned Condition 5.13(c) would address the actual review and update of emission factors by US Steel, specifically requiring US Steel to review the emission factors that it uses to determine compliance with the subject emission limits. For emission units with such limits for which emission testing is required to be conducted by the current permit, whenever such testing is conducted, US Steel would be required to review and, if necessary, update the relevant emission factors based on the results of such testing. Source-specific testing provides an authoritative statement of the actual emission rate of a particular unit. Accordingly, for the units for which testing is required to conducted, it is appropriate to only require US Steel to review and possibly update emission factors in conjunction with such testing. For those emission units with limits for which emission testing is not required to be conducted by this permit, US Steel would be required to review and, if necessary, update the relevant emission factors on at least an annual basis. This review would be required to consider new information that is relevant to the actual emissions of such units that has become available since the previous review, including revisions of USEPA's *Compilation of Air Pollutant Emission Factors*, AP-42, other information published by USEPA, information related to other emission units operated by US Steel, information presented in specific papers and reports concerning the steel industry, and other salient information. Since emission testing is not conducted for these units, which would provide authoritative confirmation of their actual emission rates, US Steel should be required to review the appropriateness of the factors for these units on a regular schedule, to consider new information that would necessitate any updates to such factors. It would be reasonable for such review to be conducted annually consistent with the timing of the annual compliance certification that US Steel must prepare and submit for the source under the CAAPP.

Reporting requirements related to US Steel's review and update of its emission factors would be addressed in planned Condition 5.13(d). Condition 5.13(d)(i) would refer back to Condition 5.9.6(c)(ii) of the current permit. Condition 5.9.6(c)(ii) already requires US Steel to submit copies of its revised records for emission factors to the Illinois EPA when these records are revised.[36] When the records for emission factors are actually revised by US Steel pursuant to the review that would be required by Condition 5.13(c), Condition 5.9.6(c)(ii) would require that the revised records that result be submitted to the Illinois EPA. As new Condition 5.13 would be added to the CAAPP permit generally dealing with US Steel's use of emission factors to determine compliance with the subject limits, it is appropriate that this existing reporting requirement in Condition 5.9.6(c)(ii) also be addressed in new Condition 5.13.

Planned Condition 5.13(d)(ii) would address another aspect of reporting for the reviews of emission factors that would be required by Condition 5.13(c). While

---

methodologies" for the subject limits, which would not entail use of emission factors, the Illinois EPA is not proposing to include any such methodologies in the revised permit. As discussed, it is generally appropriate for compliance with the subject limits to be determined with emission factors, in the manner provided by the permit.

[36] Condition 5.9.6(c) was included in the current CAAPP permit in response to certain public comments when the permit was revised in May 2011. (*See* Comment/Response 37 in the *Response to Comments on the Planned Issuance of a Revised Clean Air Act Permit Program (CAAPP) Permit to U.S. Steel Corporation, Granite City Works*, Illinois EPA, May 2. 2011.

planned Condition 5.13(c) would require that US Steel conduct such reviews, these reviews would not necessarily always lead to updates to emission factors, so as to be followed by preparation and submittal of revised records to the Illinois EPA. Accordingly, Condition 5.13(d)(ii) would require US Steel to submit reports to the Illinois EPA related to these reviews. At a basic level, these reports would serve to provide positive confirmation that US Steel had conducted the required review of emission factors. In addition, these reports would also provide key information about the reviews that were conducted for the subject units and limits, including identification of any testing conducted during the previous year, or a description of new information that was considered, and the findings and conclusion of its review of such information.[37] These reports would also provide a summary of any updates to the relevant emission factors made by US Steel. The inclusion of this further information in the reports would be appropriate and reasonable as it will further facilitate, as well as simplify, the supervision of the use of emission factors by US Steel by the Illinois EPA and the potential involvement of the public in this process. This is especially true as the planned revised permit would now require US Steel to conduct an annual review for the emission factors that it is using. In this regard, it would be appropriate for these reports to be submitted annually, for the review conducted during the previous calendar year. The reports should also be submitted by the same date as the annual compliance certification, which also address operation and compliance of a source during the previous calendar year.

Planned Condition 5.13(e) would set forth a formal procedure to address potential circumstances in which US Steel should conduct further review of the particular emission factor(s) that it is using for certain limits. The planned condition would require US Steel to conduct such review within 45 days of written notification from the Illinois EPA or USEPA that such review is needed for particular emission factor(s). The circumstances under which US Steel would potentially need to conduct such additional review, as addressed in this planned condition, include inadequate documentation for the selected emission factor(s), inadequate explanation for updates to emission factor(s) in the reports for such updates, apparent failure to appropriately address a new mode of operation, and the need to consider other new information which appears pertinent to the emissions of a subject unit. This planned condition would respond to the concern, as generally expressed by USEPA in the Second Order, that the current CAAPP permit does not include adequate provisions for supervision by the Illinois EPA of US Steel's use of emission factors. It is not appropriate for the additional provisions related to emission factors in the CAAPP permit to require prior approval of emission factors by the Illinois EPA, since the permit would not provide US Steel with any permit shield in conjunction with the use of those factors.[38] However, it is appropriate for the revised permit to include procedural requirements that would facilitate supervision by the Illinois EPA, as well as by USEPA, of US Steel's use of emission factors. At a minimum, this is because the Act would not provide a mechanism to accomplish this other than by means of enforcement. The planned condition would provide a simpler and more direct mechanism to deal with the

[37] If the review for a particular unit would result in an update to the relevant emission factor, the detailed information for such update or revision to the emission factor should be provided in the revised records submitted to the Illinois EPA pursuant to Condition 5.9.6(c).

[38] In addition, USEPA has not suggested in the Order that it would be appropriate to provide any such shield, as would be implicit if the Illinois EPA were to specifically approve the emission factors that US Steel would use to determine compliance with the subject limits.

need for US Steel to conduct further review of certain emission factor(s) that it is using, when requested to do so by the Illinois EPA or USEPA. As such a mechanism would be established, it is appropriate for the planned condition to specify the circumstances in which it might be invoked. The planned condition lists the circumstances in which it is reasonable for US Steel to be required to conduct further review of particular emission factor(s).

IV. Provisions of the CAAPP Permit under State Rules for Startups and Malfunction/Breakdown Events

USEPA Order

In Section III of the Second Order, USEPA discussed ABC's allegations that the revised CAAPP permit issued in May 2011 continues to "pre-approve" US Steel's operation in excess of certain applicable emission standards. In this regard, it also addressed ABC's allegation that the Illinois EPA's interpretation in the Statement of Basis and Responsiveness Summary for the May 2011 permit relative to conditions for startup and malfunction/breakdown is not consistent with the terms of the actual permit and the relevant provisions of Illinois' State Implementation Plan (SIP).

As a preliminary matter, the Second Order found that the Illinois EPA appropriately explained that the sole determination made in advance of a malfunction/breakdown or startup event is whether a source requested permission to continue to operate during a malfunction/breakdown or startup event in its application, and that such authorization "does not shield the Permittee from enforcement for any such violation and only constitutes a prima facie defense to such enforcement action." USEPA agreed that the CAAPP permit conditions were consistently worded with the Illinois EPA's interpretation of its SIP.

Next, USEPA referred to ABC's claims that US Steel's application to continue operation during startup or malfunction/breakdown events did not comply with the Illinois SIP given it did not supply all the information required by the SIP. USEPA granted the petition on this issue finding that the Illinois EPA may not grant permission to US Steel to operate during a startup or malfunction/breakdown event absent an application from US Steel that includes all of the information required by Illinois SIP at 35 IAC 201.261 and 201.262.

In response to the Second Order, US Steel submitted additional information to the Illinois EPA to support its request for malfunction/breakdown and startup authorization consistent with the requirements of 35 IAC 201.261, Contents of Request for Permission to Operate During a Malfunction, Breakdown or Startup. Under 35 IAC 201.262, Standards for Granting Permission to Operate During a Malfunction, Breakdown or Startup, the standard for the Illinois EPA to grant continued operation during a malfunction or breakdown is that such continued operation is necessary to prevent injury to persons or severe damage to equipment. The standard for the Illinois EPA to grant continued operation during a startup event in violation of the standards or limitations is that all reasonable efforts have been made to minimize startup emissions, duration of individual startups and frequency of startups. The Illinois EPA has reviewed the information submitted by US Steel and has determined that applicable requirements would be satisfied. Accordingly, for the emission units that are the subject of US Steel's requests, the planned revised CAAPP permit would continue to authorize US Steel to make claims related to malfunction or breakdown and startup.

General Discussion

The Illinois EPA does not provide for "automatic exemptions" within CAAPP permits for operation with excess emissions during malfunction/breakdown or startups. As related to state emissions standards under the SIP, the conditions of the current CAAPP permit issued to US Steel regarding operation during periods of malfunction/breakdown and startup are consistent with the Illinois SIP and federal guidance on the subject of compliance during such

periods. An explanation of Illinois' SIP and permitting practice in this regard follows.

Section 201.149 of Illinois' SIP prohibits continued operation of an emission unit during malfunction or breakdown of the unit or associated air pollution control equipment, or startup of an emission unit or associated air pollution control equipment, if such operation would cause a violation of applicable emission standards or limitations absent express authorization in a permit. Further provisions pertaining to such authorizations are set forth in 35 IAC Part 201, Subpart I. These provisions make clear that the process in Illinois for addressing malfunction/breakdown and startup is in two steps. The first step, as set forth at 35 IAC 201.261, consists of seeking authorization by means of a permit application to prospectively make a claim related to malfunction/breakdown or startup. For malfunction/breakdown, the application shall include an explanation of why continued operation is necessary; the anticipated nature, source quantity and duration of emissions; and measures that will be taken to minimize the quantity and duration of emissions. For startup, the application shall include a description of the startup procedure, duration and frequencies of startups, type and quantity of emissions during startups, and efforts to minimize emissions, duration and frequency. These regulatory requirements are acknowledged by the CAAPP, pursuant to Section 39.5(5)(s) of the Act. Absent a request for authorization in an application for a CAAPP permit that satisfies both the requirements for application content and the standards for granting, and, after Illinois EPA review, an express grant of such authorization in a CAAPP permit issued by Illinois EPA, a CAAPP source cannot make a claim of malfunction/breakdown or startup under Illinois' rules.

The second phase of Illinois' process for operation with excess emissions during malfunction/breakdown or startup, as set forth at 35 IAC 201.262, addresses the showing that must be made in order to make a viable claim of malfunction/breakdown or startup. For malfunction/breakdown, this showing consists of a demonstration that operation was necessary to prevent injury to persons or severe damage to equipment, or was required to provide essential services. There are two elements to the required showing, "need" and "function". For startup, it shall consist of a demonstration that all reasonable efforts have been made to minimize emissions from the startup event, to minimize the duration of the event, and to minimize the frequency of such events. To a certain extent, this showing may be evaluated on past practice. However, this showing is also prospective, like the showing for malfunction/breakdown, as it relates to future events, which and whose exact circumstances are not known, and which, in fact, may not routinely occur.

Again, the Second Order found that US Steel did not meet the content requirements, as set forth in the Illinois SIP, in its request for authorization to continue operation during startup because startup emissions were not quantified. Although no specific deficiency was identified with respect to the separate requests for malfunction/breakdown, the Second Order appears to view the two sets of requests interchangeably, as the latter set was also deemed incomplete.[39] Rationalizing that any approval of the requests by Illinois EPA was contingent upon the "adequacy" of the content of those requests, USEPA found that the Illinois EPA erred in approving the requests and the resulting conditions of the CAAPP permit were therefore "flawed."

[39] The Second Order observes that the permittee did not include "anticipated quantities of emissions, *among other things*." (emphasis added). See, Second Order at page 25. However, this vague passage sheds little light on how US Steel allegedly failed to observe the content requirements in its requests related to malfunction/breakdown.

As a threshold matter, certain legal implications relating to the Second Order on this issue are of serious concern. The most problematic issue is the source of the legal authority through which the order suggests that part of the original CAAPP permit, issued on September 3, 2009, as it addressed continued operation during startup and malfunction or breakdown events under the Illinois' SIP is void. On the face of the order, the only purported basis for this action is an alleged SIP-related deficiency reflected in the underlying CAAPP application, which was deemed administratively complete by the Illinois EPA in 1996.

The premise of USEPA's argument suggests that the slightest inadequacy in a request for startup, breakdown or malfunction authorization, deprives the State permitting authority of its jurisdiction to approve the request and invalidates (or voids) any such approval reflected in a Title V permit, even though the SIP-based requirement is largely procedural in nature (i.e., application content) and intended only to facilitate the permit authority's review. This reasoning would appear both erroneous as a matter of law, which must necessarily involve the application of *state* law for any interpretative issue derived from the Illinois SIP, and overreaching with respect to USEPA's role in reviewing Title V permits.

If the content requirements of 35 IAC 201.261 are properly considered according to principles of statutory construction, the force of the language would likely be read as mandatory.[40] However, if these obligatory requirements are not met by a permit applicant, it is equally certain that subsequent agency action relating to the incomplete request would not be invalidated for that reason alone. Because the provision does not identify the consequences of noncompliance with its requirement, the Pollution Control Board and Illinois courts would likely construe this provision as being directory, not mandatory. As such, the Illinois EPA's approval of the request would not be considered jurisdictional (and therefore deemed void) on the basis of incompleteness. This result is consistent with thirty-year old judicial case precedent, which confirmed that the Illinois EPA does not lose jurisdiction under the Act to approve a permit notwithstanding that the application is incomplete under the Pollution Control Board's rules.[41] The framework of analysis set forth in the Second Order overlooks these basic, legal aspects of the issue.

Moreover, the nature of USEPA's review of the CAAPP permit seems strikingly at odds with this agency's oversight role established in the Clean Air Act.[42] For one thing, the scope of the Second Order appears to go well beyond an evaluation of whether a CAAPP permit for a particular source complies with the substantive requirements of the Title V program. In this instance, review has extended into the State's traditional province of SIP decision-making, which, for many sources, could have originated years ago in pre-Title V state construction or operating permits. That USEPA can assume this judicial role for SIP-based determinations under Title V is not readily apparent from the CAA,

---

[40] Under the approach typical of most Illinois state courts, the use of the term "shall" would strongly suggest that the content requirements are to be properly construed as a command, imposing an obligation on the part of the applicant to submit the information as part of its relevant request(s).

[41] *White Fence Farm, Inc., v. Land and Lakes Company,* 424 N.E.2d 1370 (4th Dist. Ct. Appeals, 1981).

[42] The Illinois EPA does not question USEPA's Title V authority to generally oversee implementation of Title V permitting, including performing its separate duties of commenting on proposed permits or conducting quasi-judicial reviews of Title V permits challenged in the public petition process.

particularly given the framework of cooperative federalism upon which the latter is built.

Even if authority exists under Title V to warrant the scope of such intervention, the manner of USEPA's review failed to comport with the appropriate standard of review and neglected to justify its principal legal conclusion. To the extent that the Illinois EPA's permit decision-making involved the implementation of SIP-related requirements, or, similarly, reflected its technical expertise in the field of air pollution, USEPA should have reviewed the agency decision under a standard of abuse of discretion, instead of substituting its own judgment for that of the State permit authority. The Second Order also rests upon a legal premise that presumes too much, failing to take into account the differences in the broader factual requirements sought under 35 IAC 201.161 and the narrower legal criteria expressed in the standards for issuance under 35 IAC 201.262. It is not intuitively obvious that some of the more anecdotal information requested in 35 IAC 201.261 must serve as a factual predicate to every determination under 35 IAC 201.262.[43]

Notwithstanding the apparent legal flaws of the Second Order on this issue, US Steel has assisted the Illinois EPA in endeavoring to address the Second Order by providing further information to support its request. Specifically, for those emission units for which US Steel was provided malfunction/breakdown or startup authorization under Illinois' SIP, US Steel supplied additional information to supplement its prior requests related to malfunction/breakdown events and its prior requests related to startup. This provided the specific information required by the relevant state rules. Again for malfunction or breakdown, this information is an explanation of why continued operation is necessary; the anticipated nature, source, quantity and duration of emissions; and measures that will be taken to minimize the quantity and duration of emissions. For startup, it is a description of the startup procedure, the duration and frequency of startups, the type and quantity of emissions during startups, and efforts to minimize emissions, duration and frequency.

That the planned revised CAAPP permit would continue to allow US Steel to make claims related to malfunction/breakdown or startup would not equate to an "automatic exemption." Such authorizations would be fully consistent with long standing practice in Illinois for permitting and enforcement. Due to the size and complexity of certain emission units at the Granite City Works and the inability to simply shutdown equipment or the level of hazards associated with improper startup or shutdown of such units, the source may experience excess emissions due to events that cannot be readily anticipated or reasonably avoided. However, US Steel is also fully aware that it may be held accountable for any excess emissions that occur regardless of any such authorizations.

Neither the provisions in the SIP nor the provisions in the CAAPP permit delineating the elements for a viable claim of malfunction/breakdown or startup translate into any advanced determination on excess emissions. Rather, the regulations and the CAAPP permit provide a framework whereby US Steel may have an opportunity to make a claim related to malfunction/breakdown or startup, with the viability of such claim subject to specific review against the requisite requirements. Indeed, 35 IAC 201.265 directly states that violating

[43] The Second Order does not consider how the quantification of emissions is to be factored into or is relevant to the criteria for malfunction/breakdown authorization (i.e., personnel/equipment safety or essential service) or the minimization efforts that form the basis for the criterion governing startup authorization.

an applicable state standard even if consistent with any expression of authority regarding a malfunction/breakdown or startup set forth in a permit shall only constitute a prima facie defense to an enforcement action for such violation. The malfunction/breakdown or startup authorization that would be provided in the planned revised CAAPP permit would not shield US Steel from state emission standards that may be violated during such events. Rather, the source is subject to the applicable limitations and standards on any malfunction/breakdown or startup authorization as would continue to be included in the revised permit. As a result, any excess emissions during these events would constitute violations potentially subject to enforcement action.

Source-Specific Discussion for Malfunction/Breakdown

For the emission units that are the subject of US Steel's requests, the planned revised CAAPP permit would continue to provide authorization to US Steel to make claims of malfunction or breakdown. The Illinois EPA has reviewed the information submitted by US Steel to support its requests related to malfunction and breakdown considering the requirements of the applicable Illinois rules, which rules are part of Illinois' SIP.

As already discussed, for an emission unit for which such a request is made, 35 IAC 201.261 requires a source to submit information explaining why continued operation of the emission unit would be necessary during malfunction or breakdown events; the anticipated nature, source, quantity and duration of emissions; and measures that will be taken to minimize the quantity and duration of emissions from malfunction and breakdown. For each emission unit at the Granite City Works that is the subject of such a request,[44] US Steel has explained that authorization for a claim of malfunction or breakdown is necessary because continued operation during such events in certain circumstances would be required to prevent injury to personnel at the Granite City Works. US Steel has also explained that continued operation during such events would also be needed to prevent severe damage to equipment. US Steel also submitted information regarding the nature, sources, quantity and duration of emissions during malfunction and breakdown events. For this purpose, US Steel provided information for each subject emission unit relative to the specific state emission standards for which authorization to make a malfunction and breakdown claim has been requested. This information was necessarily general in nature, addressing "typical" and worst-case malfunction or breakdown events. This is because a malfunction or breakdown may involve a minor aspect of an emission unit, e.g., failure of particular component(s) or feature(s) of the unit, or a major aspect of an emission unit, e.g., failure of the fan in the control system of the unit. In addition, malfunction and breakdown events are by definition "unplanned" future events, so that the exact nature of these events, their effects on emissions and their duration cannot be specified. Concerning those measures that will be taken to minimize the quantity and duration of emissions for malfunctions and breakdowns, US Steel described the preventative measures that would be taken to avoid malfunction/breakdown events. These generally included preventative maintenance, keeping an inventory of spare parts, and standing contracts with service providers. Upon occurrence of a malfunction or breakdown event, US Steel committed to the use of overtime, expedited shipments of replacement parts where a spare may not be available, and the use of additional mobile equipment to expedite repairs.

[44] The subject emission units are the coke oven processes, the blast furnace processes, the basic oxygen processes and the ladle metallurgy furnace, and the boilers, for which malfunction and breakdown is addressed, respectively, in Conditions 7.2.5-5, 7.4.5-2(b)(i), 7.5.5-2(b)(i) and 7.10.3(j) of the current permit.

Based on the Illinois EPA's review of the information that has been provided, US Steel has satisfied the informational requirements of 35 IAC 201.261 related to malfunction and breakdown.

US Steel has submitted proof that continued operation of the subject units would be necessary to prevent injury to persons or severe damage to equipment, satisfying 35 IAC 201.262. In general, many of the subject emission units involve materials that are potentially dangerous, i.e., flammable coke oven gas and molten metal, which must be handled properly to prevent injury to operational personnel. These materials would present an immediate danger to these personnel if operation of the subject units did not continue during malfunction/breakdown events. This is because it would entail handling of these materials in a way that is inconsistent with the way that these units are designed to operate and safely handle these materials. The flow of material outside of the design process pathways would pose a direct hazard to personnel. The resulting consequences, e.g., the need to remove solidified metal from furnaces vessels and metal transport equipment and make repairs to such equipment, would pose a secondary threat of injury to personnel. For the boilers, the steam that is produced by the boilers is essential for maintaining the ongoing operation of the blast furnaces and certain other operations at the Granite City Works in a safe and proper manner. The integrated nature of the source means that any significant disruption in the major areas of the source, which would occur if the operations of the subject units did not continue operation during malfunction or breakdown, poses a threat of disruption in operation of other related areas of the source. This would then pose risks to the safety of personnel as normal operation of those other areas at the source is disrupted.

US Steel has also explained that continued operation during malfunction and breakdown events would be needed to prevent severe damage to equipment. Most obviously, continued operation is necessary to prevent molten material from solidifying in furnaces and transport vessels, with resulting damage to equipment. In the case of the processing of molten iron from the blast furnaces, ceasing operation and letting the metal solidify in a torpedo car would irreparably damage the car. Other examples of the severe damage that could occur if operation did not continue include damage to the brickwork in the coke ovens, rupture of gas collecting mains, damage to the blast air system and failure of refractory.

In summary, based on its review, the Illinois EPA has concluded that the regulatory requirements for granting US Steel authorization to make claims of malfunction and breakdown continue to be met. For the emission units that are the subject of US Steel's requests, the planned revised CAAPP permit would continue to provide authorization to US Steel to make claims of malfunction or breakdown.

Source-Specific Discussion for Startup

For the emission units that are the subject of US Steel's requests, the planned revised CAAPP permit would continue to provide authorization to US Steel to make claims related to startup. The Illinois EPA has carefully reviewed the information submitted by US Steel to support its requests related to startup considering the requirements of the applicable Illinois rules, which rules are part of Illinois' SIP.

As already discussed, for an emission unit for which such a request is made, 35 IAC 201.261 requires a source to submit information describing the startup

procedure, duration and frequency of startups, type and quantity of emissions during startups, and efforts to minimize emissions, duration and frequency of startups. For the emission units that are the subject of these requests,[45] US Steel has submitted this information. US Steel has provided a description of the startup procedures for the subject emission units. Startups of the units are planned in advance. Startups are conducted in accordance with established procedures that have been developed to safely bring units into normal operation. For the subject units, US Steel has also provided information on the duration and frequencies of startups and the type and quantity of emissions during startups. While the duration of a startup may vary based on the length of time that an emission unit has been out of service, the nature of maintenance and repairs that were conducted, and event-specific factors, a standard series of steps is followed during each startup to resume normal operation. For each emission unit at the Granite City Works that is subject to such a request, US Steel has also submitted information, as required by 35 IAC 201.261, describing its efforts to minimize emissions, duration and frequency of startups.[46] Based on the Illinois EPA's review of the information that has been provided related to startup, the Illinois EPA concludes that US Steel has satisfied the informational requirements of 35 IAC 201.261.

Consistent with 35 IAC 201.262, US Steel has affirmatively demonstrated that all reasonable efforts have been made and will be made to minimize startup emissions, duration of individual startups and frequency of startups. As such, the Illinois EPA has concluded that the regulatory standard for authorizing claims related to startups has been satisfied. For the different groups of subject units, the Illinois EPA's review relative to the provisions of 35 IAC 201.262 is discussed in further detail below.

Unit-Specific Discussion for Startup of Coke Oven Batteries

The frequency of startups of the coke oven batteries is minimized by US Steel. Startup of the coke oven batteries is a rare event because of the damage to the coke ovens that results when a battery is idled and then resumes operation. First, the cooling of the ovens, when they are idled, leads to damage to the refractory brickwork due to contraction. Steel components in parts of the ovens also suffer damage due to contraction and warping. Then, upon resumption of operation, the heating of the ovens causes further damage due to thermal expansion and warping. Once a coke oven battery is put into service, the preferred way of operating is to never idle the battery. US Steel has a substantial economic incentive to avoid the idling of coke oven batteries and their subsequently startup. Following idling of a coke oven battery, there are costs for the repairs for damage that must be conducted prior to and during the actual startup of a battery. Additional costs may also be present in the subsequent years of operation following resumption of operation after an idling event. The idling and restart of a battery may result in deterioration of the battery that only gradually appears, leading to the need for additional repairs and maintenance to the ovens to maintain them in proper condition. Given the consequences of idling a coke oven battery, US Steel's two coke oven batteries

[45] The subject emission units are the coke oven processes, the blast furnace processes, the reheat furnaces in the hot strip mill and the boilers, for which startup is addressed, respectively, in Conditions 7.2.5-4, 7.4.5-2(b)(ii), 7.7.5(a) and 7.10.3(i) of the current permit.

[46] As related to the frequency of startup, US Steel has appropriately focused on the circumstances that lead to emission units being taken out of service. This is because outages of emission units are followed by startups, so that the frequency of startups is in practice determined by the frequency of outages.

at the Granite City Works are rarely idled. These batteries were last idled about three years ago, in late 2009 and early 2010, after operating for many years without ever being idled. When these batteries were idled, they were each idled for extended periods of time, with only a single startup for each battery when it was brought back into service.

The occurrence of excess emissions during startup of a coke oven battery is dictated by the inability to initially operate a coke oven battery in its normal configuration. Attempting to operate in a normal configuration would pose a significant threat to the safety of personnel and to the physical integrity of the gas collecting systems on the batteries. This is because the composition of the coke oven gas initially generated by the ovens would contain air so as to present a risk of explosion, rather than merely being flammable. In addition, a number of coking cycles are needed before the coking process in a battery is fully stabilized, with consistent temperatures and other operational conditions achieved in all of the ovens in the battery.

Emissions from startup will be minimized by appropriate measures. The procedures for startup of a coke oven battery provide for the gradual startup of a battery. Only a small number of ovens will be charged until collection of coke oven gas is initiated. Once this occurs, collection of coke oven gas from the initial ovens that are then charged will each only be delayed for short time to ensure that the level of air in the collected gas does not exceed a safe level. Startup emissions are also generally minimized by the maintenance and repair work performed prior to startup. Startup emissions are also minimized by other aspects of the startup procedures. For example, a battery will be brought as close to operating temperatures as possible by means of the underfire combustion system before coal is first charged to the battery. Emissions will also be minimized by appropriate staffing of the battery during startup, which, given the magnitude of the undertaking, necessarily involves the use of additional operating and maintenance personnel, including contract labor, and the presence of management and engineering staff to immediately address any problems as they arise. Necessary staff will initiate any and all appropriate corrective actions to reduce the magnitude and duration of excess emissions as practical. Additional equipment and supplies will also be staged as appropriate during startup. By employing extra staffing with overtime, maintaining a spare parts inventory and employing additional equipment such as cranes and other mobile equipment to expedite any necessary repairs, US Steel will also be prepared to address unforeseen developments that occur during a startup of a coke oven battery and to take appropriate actions to minimize the effect of those developments on the emissions that accompany startup of the battery.

US Steel has appropriately demonstrated for the coke oven batteries that all reasonable efforts will be made to minimize startup emissions, duration of individual startups and frequency of startups. As the regulatory standard for granting authorization to make claims of startup for the coke oven batteries continues to be met, the planned revised CAAPP permit would continue to authorize US Steel to make such claims.

Unit-Specific Discussion for Startup of Blast Furnace Processes

The frequency of startups of the blast furnaces is minimized by US Steel. Startup of a blast furnace is not a frequent event. This is because of the damage to a furnace that may result when a furnace is idled, the complexity of the startup of the furnace to bring a furnace back into production, and the interruption in routine operation of the blast furnace. US Steel has a

substantial incentive to continue operating the blast furnaces as it practical to do so. The cooling of the furnace leads to deterioration and possible damage of the refractory and other components of the furnace due to contraction. Once a blast furnace is put into service, the ideal way of operating would be to never idle the furnace. However, in practice it is necessary to periodically take blast furnaces out of service for inspections, maintenance and repair to facilitate continued safe, compliant and effective operation of the furnace, including certain regular inspections that are required as a condition of US Steel's insurance. In addition, low demand for steel will necessitate the idling of the blast furnaces if the demand for steel from the Granite City Works is below the level at which the furnaces are designed to safely and efficiently operate.

The occurrence of excess emissions during startups of the blast furnaces is a natural consequence of the design and operation of these furnaces. Until the furnace is brought up to normal operating temperature and pressures and the smelting process in the furnace is fully established, the furnace will not operate in a stable fashion. This must occur gradually. The rate at which a furnace can be brought up to normal operation is constrained by the need to let the physical structure of the furnace adjust to the increase in temperature and pressure. Otherwise, the stresses in various components of the furnace may cause damage to those components. It is also necessary to coordinate the operation of the various systems that are involved in the operation of the furnaces, including the stoves and blowers for the blast air and the charging systems for ore and flux. This also dictates a gradual startup, so that operational stability and control is maintained during startup. However, until the smelting process is fully established, with stable operation of the furnace at normal operating conditions, excess emissions may occur. These emissions may occur directly from the furnace, e.g., the relief vents on the furnace. Excess emissions also may occur indirectly, e.g., the normal separation of iron, slag and dissolved gases in the tapped material has not been completed, leading to the generation of additional emissions during tapping. These occurrences cannot be readily avoided during the startup of the furnace.

Emissions during startup of the blast furnaces are minimized by startup procedures that are designed to avoid the conditions that lead to excess emissions, as well as to provide the safe return of a furnace to normal service. Control equipment and control measures for the furnaces, including the control measures for tapping, are fully operational during startup. The furnaces are equipped with instrumentation to detect problems in the operation of the furnaces. This enables corrective measures to be promptly implemented. The regular preventative maintenance and repairs that US Steel conducts for the furnaces and their instrumentation facilitates consistent startups of the furnaces in accordance with established procedures.

US Steel has appropriately demonstrated for the blast furnace processes that all reasonable efforts will be made to minimize startup emissions, duration of individual startups and frequency of startups. As the regulatory standard for granting authorization to make claims of startup for these processes continues to be met, the planned revised CAAPP permit would continue to authorize US Steel to make such claims.

Unit-Specific Discussion for Startup of Hot Strip Mill (Reheat Furnaces)

The frequency of startups of the reheat furnaces is minimized by US Steel. While these furnaces are designed to be routinely taken in and out of service, each shutdown and startup cycle contributes to wear on a furnace. The

contraction and expansion that accompanies cooling and reheating of a furnace places stresses on the refractory and other components of the unit. Reheat furnaces, like those at the Granite City Works, are taken out of service when it is necessary or reasonable to do so. Reheat furnaces are taken out of service when they are not needed or cannot be efficiently operated to meet the production schedule of the rolling mill. These schedules are developed on a weekly basis. In circumstances when a reheat furnace would not be needed, continued operation of the furnace, without a shutdown and subsequent startup, would not act to minimize emissions, since the continued operation of the furnace with its associated emissions would be unnecessary. Reheat furnaces are also taken out of service to perform routine inspections, maintenance and repair and for other repairs that are necessary for the continued safe and proper functioning of the unit. While it is in US Steel's interest to manage outages for this purpose, reheat furnaces necessarily require relatively frequent maintenance, typically about every six weeks. This is because the furnaces heat heavy steel slabs to the elevated temperatures at which rolling is conducted. Heating is conducted in a series of zones to efficiently achieve a uniform temperature profile in each steel slab that is introduced into the furnaces. Regular maintenance is needed for the proper operation of the burners and combustion systems and the mechanisms that move the slabs through the furnace, as well as to repair refractory that has deteriorated or been damaged.

The occurrence of excess emissions during startups of the reheat furnaces at the Granite City Works is a natural consequence of the design of these units, even though only fired with gaseous fuels. Excess emissions occur during startup because the temperatures in these furnaces must be gradually increased or "ramped up" during startup. Excess emissions also occur during startup due to the inability of the burners in the furnaces to operate efficiently at the low firing rates that are present during startup. The rate at which these furnaces can be brought up to normal operation is constrained by the need to let the physical structure of the furnaces adjust to the increase in temperatures. Otherwise, the levels of thermal stress in the various components of a furnace may cause damage to those components. It is also necessary to coordinate the operation of the various burners in the different sections of these furnaces. This also dictates a gradual startup, so that operational stability is maintained during startup while the furnace transitions from initial operation to normal operation. Attempting to "immediately" begin operating a furnace within its design range for firing rate would pose a threat to the safety of personnel and to the physical integrity of the furnace. The physical integrity of the furnace would directly be put at risk. As the operational stability would be put at risk, an indirect threat would be posed to personnel and the furnace. The further consideration for the startup of these furnaces is that the burners in the furnaces are designed, appropriately, to function most effectively when they are operating in their normal operating range. It is inconsistent with such design for the burners to be as effective when operating below the normal range as necessarily occurs during startup of these furnaces. However, as already explained, operation below the normal operating range is inherent in the startup of these furnaces.

Emissions during startup of the reheat furnaces are minimized by startup procedures that facilitate good combustion during startup. In addition, the duration of startups is minimized by keeping as much heat as possible in the furnace after a shutdown. This acts to shorten the duration of the subsequent startup, also reducing the amount of fuel that must be fired during startup. Each furnace is equipped with appropriate operational instrumentation relative to combustion, including instrumentation for fuel flows, flame temperatures, fan amperage, and oxygen level in the exhaust. The operation of burners is

automatically adjusted to avoid loss of flame and flame safety trips, which would act to extend the duration of startup. Operation is also automatically adjusted to maintain good combustion. Transitions between fuels are staged to maintain stability of combustion in the furnace. Startup is overseen by operating personnel, who make adjustments to maintain proper combustion during startup. The regular preventative maintenance that US Steel conducts for the furnaces and their instrumentation facilitates consistent startups of the furnaces in accordance with established procedures.

US Steel has appropriately demonstrated for its reheat furnaces that all reasonable efforts will be made to minimize startup emissions, duration of individual startups and frequency of startups. As the regulatory standard for granting authorization to make claims of startup for these furnaces continues to be met, the planned revised CAAPP permit would continue to authorize US Steel to make such claims.

Unit-Specific Discussion for Startup of Boilers

The frequency of startups of boilers is minimized by US Steel. While boilers are designed to be routinely taken in and out of service, each shutdown and startup cycle contributes to wear on the boiler. While boilers do not operate at extreme temperatures, the contraction and expansion that accompanies cooling and reheating of a boiler places stresses on the refractory and other components of the boiler. Industrial boilers, like those at the Granite City Works, are taken out of service when it is necessary or reasonable to do so. Boilers are taken out of service to perform routine inspections, maintenance and repair and for other repairs that are necessary for the continued safe and proper functioning of a boiler. Boilers are also taken out of service when they are not needed or cannot be effectively or efficiently operated to meet the current steam requirements of the facility. In these circumstances, continued operation of the boiler, without a shutdown and subsequent startup, would not act to minimize emissions, since the continued operation of the boilers with its associated emissions would be unnecessary.

The occurrence of excess emissions during startups of the three boilers at the Granite City Works, is a natural consequence of the design of larger boilers, even when only fired with gaseous fuels. The boilers are fairly large, one having a design capacity of about 500 mmBtu/hr and the others each having a capacity of about 200 mmBtu/hr. Excess emissions occur during startup because the temperatures in and the load on the boilers must be gradually "ramped up" or increased during startup and because the burner systems in the boilers operate less efficiently at the low firing rates that are present during startup. The rate at which these boilers can be brought up to normal operation is constrained by the need to let the physical structure of the boiler adjust to the increase in temperatures. Otherwise, the levels of thermal stress in various components of the boiler may cause damage to those components. It is also necessary to coordinate the operation of the fuel, combustion air and feed water systems on a boiler. This also dictates a gradual startup. Operational stability must be maintained during startup while the boiler transitions from initial operation to normal operation, with firing of natural gas and coke oven gas and/or blast furnace gas. Attempting to "immediately" begin operating a boiler within its design range for firing rate and steam load would pose a significant threat to the safety of personnel and to the physical integrity of the boiler. The physical integrity of the boiler would directly be put at risk. As the operational stability would be put at risk, an indirect threat would be posed to personnel and the boiler. The further consideration for the startup of the boilers is that the combustion system in the boilers are designed,

appropriately, to function most effectively when a boiler is operating in its normal operating range. It follows that the burners will be less effective when operating below the normal range as necessarily occurs during startup of a boiler.[47] However, as already explained, operation below the normal operating range is inherent in the startup of a larger boiler.

Emissions during startup of the boilers are minimized by startup procedures that facilitate good combustion during startup. The boilers are equipped with instrumentation, including fuel flow meters, flame safeties, and oxygen meters, that enable good combustion to be maintained during startup. Startup is overseen by operating personnel, who make adjustments to maintain proper combustion during startup. The regular periodic maintenance for the boilers, including their instrumentation, facilitates consistent startups of the boilers in accordance with established procedures.

US Steel has appropriately demonstrated for the boilers that all reasonable efforts will be made to minimize startup emissions, duration of individual startups and frequency of startups. As the regulatory standard for granting authorization to make claims of startup for the boilers continues to be met, the planned revised CAAPP permit would continue to authorize US Steel to make such claims.

[47] It is also not practical to have separate smaller burners for startup, which are efficient at such lower loads. It would still be necessary to transition from those burners to the main burners during startup and the presence of those burners would further complicate and likely prolong the startup of a boiler.

ATTACHMENT: EMISSION FACTORS AND SUPPORTING INFORMATION

Material Handling - Section 7.1

Permit Condition 7.1.6(b)(i) and 7.6.6(a) - Ladle Metallurgy Material Handling

	Pollutant: PM/PM_{10}
Emission Factor:	0.00355 lbs/ton of steel
Control Device:	Baghouse #1
Origin of EF:	Calculation from AP-42, Fourth Edition, Table 7.5.1, Iron and Steel Production, Page 13.2.4-4, Fugitive Uncontrolled emissions, with a 99.8% control efficiency. a. 50% of Hot Metal transfer factor (0.19), b. EAF Charging, tapping and slagging (1.4), c. Conveyors #4, 5 and 6 (0.0286).
Update Methodology:	Refer to Conditions 7.1.7(b), 7.1.9(f), 7.6.9(c), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
This baghouse will be tested in the future whereby this emission factor will be reviewed and may be updated.

Permit Condition 7.1.6(b)(ii) - Basic Oxygen Furnace Additive System

	Pollutant: PM/PM_{10}
Emission Factor:	0.00032 lbs/ton of steel
Control Device:	Trackhopper Baghouse
Origin of EF:	Calculated from AP-42, Page 13.2.4-4, Fugitive uncontrolled emissions, with a 99.9% control efficiency.
Update Methodology:	Refer to Conditions 7.1.7(b), 7.1.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
This baghouse will be tested in the future whereby this emission factor will be reviewed and may be updated.

Permit Condition 7.1.6(b)(iii) - Flux Conveyor Operations

	Pollutant: PM/PM_{10}
Emission Factor:	0.0016 lbs/ton of steel
Control Device:	Bin Floor Baghouse
Origin of EF:	Calculated from AP-42, Page 13.2.4-4, Fugitive controlled emissions with a 99.3% control efficiency.
Update Methodology:	Refer to Conditions 7.1.7(b), 7.1.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
This baghouse will be tested at a point in the future whereby this emission factor will be reviewed and may be updated.

Material Handling - Section 7.1 (continued)

Permit Condition 7.1.6(b)(iv) - Iron Pellet Screening

	Pollutant: PM/PM_{10}
Emission Factor:	0.00279 lbs/ton of iron pellets
Origin of EF:	Calculation from AP-42, Page 13.2.4-4, Fugitive uncontrolled emissions.
Update Methodology:	Refer to Conditions 7.1.9(f), 5.9.6(c) and 5.13 of the permit.

Iron Production - Section 7.4

Permit Condition 7.4.6(b) - Blast Furnace Casthouse Baghouse Exhaust

Pollutant: PM/PM_{10}

Emission Factor:	0.0703 lbs/ton of iron
Control Device:	Casthouse Baghouse
Origin of EF:	Calculated from AP-42, Table 7.5-1, Fourth Edition, Iron and Steel Production, with an overall 95% control efficiency.
Update Methodology:	Refer to Conditions 7.4.7(a) and (c), 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
January 2010 Emissions Testing, measured rate of 0.0041 lbs/ton iron.
March 2012 ICR Emissions Testing, measured rate of 0.0199 lbs/ton iron.

Pollutant: SO_2

Emission Factor:	0.2006 lbs/ton of iron
Origin of EF:	July 1993 Emissions Testing.
Update Methodology:	Refer to Conditions 7.4.7(a) and (c), 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
March 2012 ICR Emissions Testing, measured rate of 0.1903 lbs/ton iron.

Pollutant: NO_x

Emission Factor:	0.0144 lbs/ton of iron
Origin of EF:	July 1993 Emissions Testing.
Update Methodology:	Refer to Conditions 7.4.7(a) and (c), 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
This pollutant will be tested prior to the expiration of the permit whereby this emission factor will be reviewed and may be updated.

Pollutant: VOM

Emission Factor:	0.0946 lbs/ton of iron
Origin of EF:	July 1993 Emissions Testing.
Update Methodology:	Refer to Conditions 7.4.7(a) and (c), 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
This pollutant will be tested prior to the expiration of the permit whereby this emission factor will be reviewed and may be updated.

Permit Condition 7.4.6(c) - Blast Furnace Uncaptured Emissions

Pollutant: PM

Emission Factor:	0.031 lbs/ton of iron
Origin of EF:	Calculated from AP-42 Table 7.5-1, Fourth Edition, Iron and Steel Production, with a 95% capture efficiency and an adjustment factor for the presence of local hoods.
Update Methodology:	Refer to Conditions 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Iron Production - Section 7.4 (continued)

Pollutant: PM_{10}

Emission Factor:	0.0155 lbs/ton of iron
Origin of EF:	Calculated from AP-42, Table 7.5-2, Fourth Edition, Iron and Steel Production, using PM_{10}/TSP ratio = 50%.
Update Methodology:	Refer to Conditions 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Pollutant: SO_2

Emission Factor:	0.0104 lbs/ton of iron
Origin of EF:	July 1993 Emissions Testing on Casthouse baghouse, with a 95% capture efficiency.
Update Methodology:	Refer to Conditions 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Pollutant: NO_x

Emission Factor:	0.0007 lbs/ton of iron
Origin of EF:	July 1993 Emissions Testing on Casthouse baghouse, with a 95% capture efficiency.
Update Methodology:	Refer to Conditions 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Pollutant: VOM

Emission Factor:	0.0047 lbs/ton of iron
Origin of EF:	July 1993 Emissions Testing on Casthouse baghouse, with a 95% capture efficiency.
Update Methodology:	Refer to Conditions 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Permit Condition 7.4.6(d) - Blast Furnace Charging

Pollutant: PM/PM_{10}

Emission Factor:	0.0024 lbs/ton of iron pellets
Origin of EF:	AIRS Emissions Inventory, SCC #3-03-008-021.
Update Methodology:	Refer to Conditions 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Permit Condition 7.4.6(e) - Slag Pits

Pollutant: PM/PM_{10}

Emission Factor:	0.00417 lbs/ton of iron
Origin of EF:	Calculated from EPA Assessment of Atmospheric Emissions from Quenching of Blast Furnace Slag. Also, AP-42, Table 13.2.4-4, Fugitive Uncontrolled emissions. Summation of the following emission factors: a. Slag Quenching = 0.0026 lbs/ton iron, b. Slag Digging = 0.00157 lbs/ton iron.
Update Methodology:	Refer to Conditions 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Iron Production - Section 7.4 (continued)

Pollutant: SO_2

Emission Factor:	0.01 lbs/ton of iron
Origin of EF:	Calculated from EPA Assessment of Atmospheric Emissions from Quenching of Blast Furnace Slag.
Update Methodology:	Refer to Conditions 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Permit Condition 7.4.6(f) - Blast Furnace Iron Spout Baghouse Exhaust

Pollutant: PM/PM_{10}

Emission Factor:	0.02548 lbs/ton of iron
Control Device:	Iron Spout Baghouse
Origin of EF:	Calculated from AP-42, Fourth Edition, Table 7.5-1, Iron and Steel Production, with an overall 98% capture efficiency.
Update Methodology:	Refer to Conditions 7.4.7(a) and (c), 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
September 2009 Emissions Testing, measured rate of 0.00434 lbs/ton iron.
January 2010 Emissions Testing, measured rate of 0.00334 lbs/ton iron.
December 2010 Emissions Testing, measured rate of 0.00822 lbs/ton iron.
March 2012 ICR Emissions Test, measured rate of 0.00507 lbs/ton iron.

Pollutant: SO_2

Emission Factor:	0.0073 lbs/ton of iron
Origin of EF:	July 1993 Emissions Testing.
Update Methodology:	Refer to Conditions 7.4.7(a) and (c), 7.4.9(i), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
March 2012 ICR Emissions Test, measured rate of 0.0004 lbs/ton iron.

Steel Production - Section 7.5

Permit Condition 7.5.6(c) - Basic Oxygen Furnace ESP Exhaust

Pollutant: PM/PM_{10}

Emission Factor:	0.16 lbs/ton of steel
Control Device:	Electrostatic Precipitator
Origin of EF:	Average of March 1989, July 1990 and August 1993 Emissions Testing results.
Update Methodology:	Refer to Conditions 7.5.7(a) and (b), 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
October 2009 Emissions Testing, measured rate of 0.0364 lbs/ton steel.
July 2012 Emissions Testing, measured rate of 0.035 lbs/ton steel.

Pollutant: NO_x

Emission Factor:	0.0389 lbs/ton of steel
Origin of EF:	August 1993 Emissions Testing.
Update Methodology:	Refer to Conditions 7.5.7(a) and (b), 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
April 2012 Emissions Testing, measured rate of 0.1273 lbs/ton steel.

Pollutant: VOM

Emission Factor:	0.006 lbs/ton of steel
Origin of EF:	AIRS Emissions Inventory, SCC Codes 3-03-009-013, 3-03-009-016, 3-03-009-017 and 3-03-009-023.
Update Methodology:	Refer to Conditions 7.5.7(a) and (b), 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
July 2012 Emissions Testing, measured rate of 0.0153 lbs/ton steel.

Pollutant: CO

Emission Factor:	8.993 lbs/ton of steel
Origin of EF:	August 1993 Emissions Testing.
Update Methodology:	Refer to Conditions 7.5.7(a) and (b), 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
July 2012 Emissions Testing, measured rate of 3.761 lbs/ton steel.

Pollutant: Lead

Emission Factor:	0.1934 lbs/hour
Control Device:	Electrostatic Precipitator
Origin of EF:	AIRS Emissions Inventory, SCC Code 3-03-009-013 with a control efficiency of 99.8%.
Update Methodology:	Refer to Conditions 7.5.7(a) and (b), 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
July 2012 Emissions Testing, measured rate of 0.0376 lbs/hour.

Steel Production - Section 7.5 (continued)

Permit Condition 7.5.6(d) - Basic Oxygen Furnace Roof Monitor

Pollutant: PM_{10}

Emission Factor:	0.066145 lbs/ton of steel
Origin of EF:	Calculated from AP-42, Fourth Edition, Table 7.5-1, Iron and Steel Production, with the following capture efficiencies: a. Charging = 95%, b. Refining = 99.9%, c. Tapping = 95%.
Update Methodology:	Refer to Conditions 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Pollutant: PM

Emission Factor:	0.0987 lbs/ton of steel
Origin of EF:	Calculated from AP-42, Fourth Edition, Table 7.5-1, Iron and Steel Production, as above using PM_{10}/TSP ratio = 67%.
Update Methodology:	Refer to Conditions 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Pollutant: Lead

Emission Factor:	0.0129 lbs/hour
Origin of EF:	AIRS Emissions Inventory, SCC Code 3-03-009-013, with a capture efficiency of 99.99%.
Update Methodology:	Refer to Conditions 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Permit Condition 7.5.6(e) - Desulfurization/Hot Metal Transfer Baghouse Exhaust

Pollutant: PM/PM_{10}

Emission Factor:	0.03721 lbs/ton of iron
Control Device:	Baghouse (Soda Ash)
Origin of EF:	Calculated from AP-42, Fourth Edition, Table 7.5-1, Iron and Steel Production, with an overall control efficiency of 96.6%.
Update Methodology:	Refer to Conditions 7.5.7(a) and (b), 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
October 2009 Emissions Testing, measured rate of 0.0021 lbs/ton iron.
May 2012 MACT Emissions Testing, measured rate of 0.00127 lbs/ton iron.

Pollutant: VOM

Emission Factor:	0.001 lbs/ton of iron
Origin of EF:	AIRS Emissions Inventory, SCC Code 3-03-009-015.
Update Methodology:	Refer to Conditions 7.5.7(a) and (b), 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
May 2012 MACT Emissions Testing, measured rate of 0.000187 lbs/ton iron.

Steel Production - Section 7.5 (continued)

Pollutant: Lead

Emission Factor:	0.0133 lbs/hour
Control Device:	Baghouse (Soda Ash)
Origin of EF:	AIRS Emissions Inventory, SCC Code 3-03-009-013, with an overall control efficiency of 96.6%.
Update Methodology:	Refer to Conditions 7.5.7(a) and (b), 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
May 2012 MACT Emissions Testing, measured rate of 0.00167 lbs/hour.

Permit Condition 7.5.6(f) - Slag Skimming Baghouse Exhaust

Pollutant: PM/PM_{10}

Emission Factor:	0.005 lbs/ton of iron
Origin of EF:	Calculated from AP-42, Fourth Edition, Table 7.5-1, Iron and Steel Production, with a control efficiency of 97.5%.
Update Methodology:	Refer to Conditions 7.5.7(a) and (b), 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
September 2009 Emissions Testing, measured rate of 0.00042 lbs/ton iron.
May 2012 MACT Emissions Testing, measured rate of 0.005 lbs/ton iron.
December 2012 Emissions Testing, measured rate of 0.0005 lbs/ton iron.

Permit Condition 7.5.6(g) - Argon Stir/LMF/Material Handling Baghouse Exhaust

Pollutant: PM/PM_{10}

Emission Factor:	0.00715 lbs/ton of steel
Control Device:	Baghouse #2
Origin of EF:	Calculated from AP-42, Fourth Edition, Table 7.5-2, Electric Arc Furnace Melting and Refining, with a control efficiency of 99.9%.
Update Methodology:	Refer to Conditions 7.5.9(f), 5.9.6(c) and 5.13 of the permit.

Additional Emissions Testing:
October 2009 Emissions Testing, measured rate of 0.000388 lbs/ton steel.
May 2012 ICR Emissions Testing, measured rate of 0.000436 lbs/ton steel.

Continuous Casting - Section 7.6

Permit Condition 7.6.6(a) - Ladle Metallurgy Material Handling

Pollutant: PM/PM_{10}

Refer to the discussion for Permit Condition 7.1.6(b)(i).

Permit Condition 7.6.6(b) - Caster Molds

Pollutant: PM/PM_{10}

Emission Factor:	0.006 lbs/ton of steel
Origin of EF:	Illinois EPA 1991 EIS PM/PM_{10} Report.
Update Methodology:	Refer to Conditions 7.6.9(c), 5.9.6(c) and 5.13 of the permit.

Pollutant: NO_x

Emission Factor:	0.05 lbs/ton of steel
Origin of EF:	AIRS Emissions Inventory, SCC Code 3-03-009-022.
Update Methodology:	Refer to Conditions 7.6.9(c), 5.9.6(c) and 5.13 of the permit.

Permit Condition 7.6.6(c) - Spray Chambers

Pollutant: PM/PM_{10}

Emission Factor:	0.00852 lbs/ton of steel
Origin of EF:	1981 Emissions Testing before a baghouse on this unit was removed (circa 1990), adjusted to not account for the baghouse based on 99.3% control efficiency.
Update Methodology:	Refer to Conditions 7.6.7(a), 7.6.9(c), 5.9.6(c) and 5.13 of the permit.

Permit Condition 7.6.6(d) - Slab Cutoff

Pollutant: PM/PM_{10}

Emission Factor:	0.0071 lbs/ton of steel
Origin of EF:	Illinois EPA 1991 EIS PM/PM_{10} Report.
Update Methodology:	Refer to Conditions 7.6.9(c), 5.9.6(c) and 5.13 of the permit.

Permit Condition 7.6.6(e) - Slab Ripping

Pollutant: PM/PM_{10}

Emission Factor:	0.00722 lbs/ton of steel.
Origin of EF:	Illinois EPA 1991 EIS PM/PM10 Report.
Update Methodology:	Refer to Conditions 7.6.9(c), 5.9.6(c) and 5.13 of the permit.

RETURN RECEIPT REQUESTED

Mr. Edwin C. Bakowski, P. E.
Acting Manager, Permit Section
Division of Air Pollution Control
Illinois Environmental Protection Agency
1021 North Grand Avenue East
Post Office Box 19276
Springfield, Illinois 62794

RE: Modification of Production
Increase Permit (No. 95010001)
Facility ID No.: 119813AAI

Dear Mr. Bakowski:

Enclosed please find an original and three copies of United States Steel Corporation's application to modify Permit No. 95010001 known as the Production Increase Permit. The application to modify is to correct the emission factors used to develop the original application and permit in light of newly identified information on emissions and emission factors. The proposed permit modification will increase SO_2 emission factors for the combustion of Blast Furnace Gas (BFG) and CO and VOM emission factors for the combustion of natural gas. No physical changes or changes in the method of operations are being proposed.

Submittal of this application including air quality modeling fulfills the requirements of condition D 4 (a) "Compliance Schedule for the Blast Furnace Gas SO_2 Emissions" as contained in Consent Order No. 05-CH-750 (ordered on December 18, 2007 by the Third Judicial Circuit, Madison County, Illinois).

Should you have questions or require further information, please do not hesitate to contact Larry Siebenberger at 618-451-3391.

Sincerely,

David J. Rintoul
General Manager

RE: Modification of Production
Increase Permit (No. 95010001)
Facility ID No.: 119813AAI

Dear Mr. Bakowski:

Enclosed please find an original and three copies of United States Steel Corporation's application to modify Permit No. 95010001 known as the Production Increase Permit. The application to modify is to correct the emission factors used to develop the original application and permit in light of newly identified information on emissions and emission factors. The proposed permit modification will increase SO_2 emission factors for the combustion of Blast Furnace Gas (BFG) and CO and VOM emission factors for the combustion of natural gas. No physical changes or changes in the method of operations are being proposed.

Submittal of this application including air quality modeling fulfills the requirements of condition D 4 (a) "Compliance Schedule for the Blast Furnace Gas SO_2 Emissions" as contained in Consent Order No. 05-CH-750 (ordered on December 18, 2007 by the Third Judicial Circuit, Madison County, Illinois).

Should you have questions or require further information, please do not hesitate to contact Larry Siebenberger at 618-451-3391.

Sincerely,

David J. Rintoul
General Manager

This Agency is authorized to require and you must disclose this information under 415 ILCS 5/39. Failure to do so could result in the application being denied and penalties under 415 ILCS 5 et seq. It is not necessary to use this form in providing this information. This form has been approved by the forms management center.

Summary Of Application Contents		
24.	Does the application address whether the proposed project would constitute a new major source or major modification under each of the following programs: a) Non-attainment New Source Review - 35 IAC Part 203; b) Prevention of Significant Deterioration (PSD) - 40 CFR 52.21; c) Hazardous Air Pollutants: Regulations Governing Constructed or Reconstructed Major Sources - 40 CFR Part 63?	☒ Yes ☐ No
25.	Does the application identify and address all applicable emissions standards, including those found in the following: a) Board Emission Standards - 35 IAC Chapter 1, Subtitle B; b) Federal New Source Performance Standards - 40 CFR Part 60; c) Federal Standards for Hazardous Air Pollutants - 40 CFR Parts 61 and 63?	☒ Yes ☐ No
26.	Does the application include a process flow diagram(s) showing all emission units and control equipment; and their relationship, for which a permit is being sought?	☒ Yes ☐ No
27.	Does the application include a complete process description for the emission units and control equipment for which a permit is being sought?	☒ Yes ☐ No
28.	Does the application include the information as contained in completed CAAPP forms for all appropriate emission units and air pollution control equipment, listing all applicable requirements and proposed exemptions from otherwise applicable requirements, and identifying and describing any outstanding legal actions by either the USEPA or the Illinois EPA? Note: The use of "APC" application forms is not appropriate for applications for CAAPP sources. CAAPP forms should be used to supply information.	☒ Yes ☐ No
29.	If the application contains TRADE SECRET information, has such information been properly marked and claimed, and have two separate copies of the application suitable for public inspection and notice been submitted, in accordance with applicable rules and regulations?	☐ Yes ☐ No ☒ Not Applicable, No TRADE SECRET information in this application

Note 1 - Answering "No" to any of the above may result in the application being deemed incomplete.

Signature Block

This certification must be signed by a responsible official. Applications without a signed certification will be returned as incomplete.

30. I certify under penalty of law that, based on information and belief formed after reasonable inquiry, the statements and information contained in this application are true, accurate and complete.

SOURCE INFORMATION

1) SOURCE NAME: US Steel-Granite City Works	
2) PROJECT NAME: Production Increase Mod	3) SOURCE ID NO. (IF APPLICABLE): 119813AAI
4) CONTACT NAME: Larry Siebenberger	5) CONTACT PHONE NUMBER: (618) 451-3391

FEE DETERMINATION

6) FILL IN THE FOLLOWING THREE BOXES AS DETERMINED IN SECTIONS 1 THROUGH 4 BELOW:

$ 0	+	$ 8,000	=	$ 8,000
SECTION 1 SUBTOTAL		SECTION 2, 3 OR 4 SUBTOTAL		GRAND TOTAL

SECTION 1: STATUS OF SOURCE / PURPOSE OF SUBMITTAL

7) YOUR APPLICATION WILL FALL UNDER ONLY ONE OF THE FOLLOWING SIX CATEGORIES DESCRIBED BELOW. CHECK THE BOX THAT APPLIES, ENTER THE CORRESPONDING FEE IN THE BOX TO THE RIGHT AND COPY THIS FEE INTO THE SECTION 1 SUBTOTAL BOX ABOVE. PROCEED TO APPLICABLE SECTIONS.

FOR PURPOSES OF THIS FORM:

- ***MAJOR SOURCE*** IS A SOURCE THAT IS REQUIRED TO OBTAIN A CAAPP PERMIT.
- ***SYNTHETIC MINOR* SOURCE** IS A SOURCE THAT HAS TAKEN LIMITS ON POTENTIAL TO EMIT IN A PERMIT TO AVOID CAAPP PERMIT REQUIREMENTS (E.G., FESOP).
- ***NON-MAJOR* SOURCE** IS A SOURCE THAT IS NOT A MAJOR OR SYNTHETIC MINOR SOURCE.

☒ EXISTING SOURCE WITHOUT STATUS CHANGE OR WITH STATUS CHANGE FROM SYNTHETIC MINOR TO MAJOR SOURCE OR VICE VERSA. ENTER $0 AND PROCEED TO SECTION 2.	
☐ EXISTING NON-MAJOR SOURCE THAT WILL BECOME SYNTHETIC MINOR OR MAJOR SOURCE. ENTER $5,000 AND PROCEED TO SECTION 4.	
☐ EXISTING MAJOR OR SYNTHETIC MINOR SOURCE THAT WILL BECOME NON-MAJOR SOURCE. ENTER $4,000 AND PROCEED TO SECTION 3.	$ 0 SECTION 1 SUBTOTAL
☐ NEW MAJOR OR SYNTHETIC MINOR SOURCE. ENTER $5,000 AND PROCEED TO SECTION 4.	
☐ NEW NON-MAJOR SOURCE. ENTER $500 AND PROCEED TO SECTION 3.	
☐ AGENCY ERROR. IF THIS IS A TIMELY REQUEST TO CORRECT AN ISSUED PERMIT THAT INVOLVES ONLY AN AGENCY ERROR AND IF THE REQUEST IS RECEIVED WITHIN THE DEADLINE FOR A PERMIT APPEAL TO THE POLLUTION CONTROL BOARD, THEN ENTER $0. SKIP SECTIONS 2, 3 AND 4. PROCEED DIRECTLY TO SECTION 5.

SECTION 3: FEES FOR CURRENT OR PROJECTED NON-MAJOR SOURCES	
9) IF THIS APPLICATION CONSISTS OF A SINGLE NEW EMISSION UNIT OR NO MORE THAN TWO MODIFIED EMISSION UNITS, ENTER $500.	9)
10) IF THIS APPLICATION CONSISTS OF MORE THAN ONE NEW EMISSION UNIT OR MORE THAN TWO MODIFIED UNITS, ENTER $1,000.	10)
11) IF THIS APPLICATION CONSISTS OF A NEW SOURCE OR EMISSION UNIT SUBJECT TO SECTION 39.2 OF THE ACT (I.E., LOCAL SITING REVIEW); A COMMERCIAL INCINERATOR OR A MUNICIPAL WASTE, HAZARDOUS WASTE, OR WASTE TIRE INCINERATOR; A COMMERCIAL POWER GENERATOR; OR AN EMISSION UNIT DESIGNATED AS A COMPLEX SOURCE BY AGENCY RULEMAKING, ENTER $15,000.	11)
12) IF A PUBLIC HEARING IS HELD (SEE INSTRUCTIONS), ENTER $10,000.	12)
13) SECTION 3 SUBTOTAL (ADD LINES 9 THROUGH 12) TO BE ENTERED ON PAGE 1.	13)

SECTION 4: FEES FOR CURRENT OR PROJECTED MAJOR OR SYNTHETIC MINOR SOURCES			
Application Contains Modified Emission Units Only	14) FOR THE FIRST MODIFIED EMISSION UNIT, ENTER $2,000.	14) 2000	
	15) NUMBER OF ADDITIONAL MODIFIED EMISSION UNITS = 0 X $1,000.	15) 0	
	16) LINE 14 PLUS LINE 15, OR $5,000, WHICHEVER IS LESS.		16) 2000
Application Contains New And/Or Modified Emission Units	17) FOR THE FIRST NEW EMISSION UNIT, ENTER $4,000.	17) 0	
	18) NUMBER OF ADDITIONAL NEW AND/OR MODIFIED EMISSION UNITS = _____ X $1,000.	18) 0	
	19) LINE 17 PLUS LINE 18, OR $10,000, WHICHEVER IS LESS.		19) 0
Application Contains Netting Exercise	20) NUMBER OF INDIVIDUAL POLLUTANTS THAT RELY ON A NETTING EXERCISE OR CONTEMPORANEOUS EMISSIONS DECREASE TO AVOID APPLICATION OF PSD OR NONATTAINMENT NSR = 0 X $3,000.		20) 0
Additional Supplemental Fees	21) IF THE NEW SOURCE OR EMISSION UNIT IS SUBJECT TO SECTION 39.2 OF THE ACT (I.E., SITING); A COMMERCIAL INCINERATOR OR OTHER MUNICIPAL WASTE, HAZARDOUS WASTE, OR WASTE TIRE INCINERATOR; A COMMERCIAL POWER GENERATOR; OR ONE OR MORE OTHER EMISSION UNITS DESIGNATED AS A COMPLEX SOURCE BY AGENCY RULEMAKING, ENTER $25,000.		21) 0
	22) IF THE SOURCE IS A NEW MAJOR SOURCE SUBJECT TO PSD, ENTER $12,000.		22) 0
	23) IF THE PROJECT IS A MAJOR MODIFICATION SUBJECT TO PSD, ENTER $6,000.		23) 6000
	24) IF THIS IS A NEW MAJOR SOURCE SUBJECT TO NONATTAINMENT (NAA) NSR, ENTER $20,000.		24) 0
	25) IF THIS IS A MAJOR MODIFICATION SUBJECT TO NAA NSR, ENTER $12,000.		25) 0
	26) IF APPLICATION INVOLVES A DETERMINATION OF CLEAN UNIT STATUS AND THEREFORE IS NOT SUBJECT TO BACT OR LAER, ENTER $5,000 PER UNIT FOR WHICH A DETERMINATION IS REQUESTED OR OTHERWISE REQUIRED. _____ X $5,000.		26) 0
	27) IF APPLICATION INVOLVES A DETERMINATION OF MACT FOR A POLLUTANT AND THE PROJECT IS NOT SUBJECT TO BACT OR LAER FOR THE RELATED POLLUTANT UNDER PSD OR NSR (E.G., VOM FOR ORGANIC HAP), ENTER $5,000 PER UNIT FOR WHICH A DETERMINATION IS REQUESTED OR OTHERWISE REQUIRED. _____ X $5,000.		27) 0
	28) IF A PUBLIC HEARING IS HELD (SEE INSTRUCTIONS), ENTER $10,000.		28)
29) SECTION 4 SUBTOTAL (ADD LINES 16 AND LINES 19 THROUGH 28) TO BE ENTERED ON PAGE 1.			29) 8000

SECTION 5: CERTIFICATION

NOTE: APPLICATIONS WITHOUT A SIGNED CERTIFICATION WILL BE DEEMED INCOMPLETE.

30) I CERTIFY UNDER PENALTY OF LAW THAT, BASED ON INFORMATION AND BELIEF FORMED AFTER REASONABLE INQUIRY, THE INFORMATION CONTAINED IN THIS FEE APPLICATION FORM IS TRUE, ACCURATE AND COMPLETE.

The United States Steel Corporation Granite City Works (the Facility) is herein making application to modify Permit No. 95010001 known as the Production Increase Permit. The Facility is an integrated iron and steel manufacturing plant located in Granite City, Illinois as seen in **Figure 1-1** Site Location Map. The Facility is a major source as defined by 35 IAC 203.206.

This application to modify is to correct the emission factors used to develop the original application and permit in light of newly identified information on emissions and emission factors. The proposed permit modification will increase SO_2 emission factors for the combustion of BFG and CO and VOM emission factors for the combustion of natural gas. No physical changes to the operations at the facility are proposed. This modification strictly addresses deficiencies in the emission factors used in the original Production Increase Permit application and the Illinois Environmental Protection Agency (IEPA) issued permit (Permit No. 95010001).

This application includes a general facility description below. Section Two includes a discussion of relevant processes at the Granite City Works and the resulting changes to Permit No. 95010001 as a result of the proposed emission factors. Section Three contains a revised emissions analysis for the Production Increase Permit. Section Four includes an analysis of the regulatory requirements resulting from the revised Production Increase Permit emission factors. Section Five includes an updated and revised analysis of Best Available Control Technology (BACT) that takes into account the revised emissions estimates. The revised air quality modeling performed for the Production Increase Permit is presented in Section Six. Section Seven includes the additional impact analysis required as part of a Prevention of Significant Deterioration (PSD) application.

1.1 GENERAL FACILITY DESCRIPTION

The United States Steel – Granite City Works is located in Madison County, Illinois. The largest city near the facility is St. Louis, Missouri, which is located approximately 15 kilometers southwest of the Granite City mill. The latitude and longitude of the mill are approximately 38:41:55 and 90:08:42. The facility occupies approximately 1,100 acres of land in an area primarily used for industrial and agricultural purposes. A site location map is provided in **Figure 1-1**. A site map is provided in **Figure 1-2.**

The United States Steel – Granite City Works is owned and operated by United States Steel Corporation. The responsible official is David Rintoul, General Manager of Granite City Works.

The primary contact for questions regarding this application is Mr. Larry Siebenberger, Manager of Environmental Quality Control. His telephone number is 618-451-3391. The secondary contact for questions regarding this application is Mr. Robert Ribbing who may be reached at 618-451-4026.

The street address for the Facility is:

United States Steel – Granite City Works
1951 State Street
Granite City, Illinois 62040

In general, the Granite City Works receives raw materials by rail and truck, and produces steel coils of various sizes and finishes to meet customer needs. Products are shipped from the mill by rail and truck.

The Standard Industrial Classification (SIC) Code for the facility is 3312.

1.2 PERMITTING HISTORY

The Granite City Works submitted an application for a Clean Air Act Permit Program (CAAPP) permit in February 1996. IEPA is currently preparing the Facility's draft CAAPP Permit. Until the Granite City Works CAAPP permit is finalized the Facility operates under 30 separate operating permits for various units. Relevant operating permits are detailed below.

IEPA Permit Nos. 72080034 and 72080036 limit operations at the "A" and "B" Blast Furnaces, the Blast Furnace Casthouse, the BFG Scrubber and the Iron Spout and Casthouse Baghouses. These two permits allow the injection of intermediate light oil from the By-Products Plant and recycled oil from operations in the plant to be injected into both blast furnaces as alternative carbon sources.

In 1994 Granite City Works obtained a SO_2 Federally Enforceable State Operating Permit (FESOP) for combustion of Coke Oven Gas (COG) in certain fuel combustion units. The SO_2 FESOP (IEPA Permit No. 94120017) limited SO_2 emissions from COG combustion at all COG combustion units. SO_2 ambient air quality modeling for this application is dependent on the SO_2 limits in the SO_2 FESOP.

In late 1994, Granite City Works submitted a PSD permit application for a production increase at the Granite City Works. The Production Increase Permit Application showed the project would result in a significant increase in SO_2 and CO. The project netted out of PSD review for NO_x, PM, PM_{10} and VOC. The Production Increase Permit (IEPA Permit No. 95010001) was issued in 1996. This permit sets SO_2 emission limits for the Casthouse Baghouse (422 tons SO_2 per year), the uncaptured Casthouse Fugitives (21.94 tons SO_2 per year), the Slag Pits (15.83 tons SO_2 per year), and Iron Spout Baghouse (13.89 tons SO_2 per year).

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

2.1 BLAST FURNACES

The Facility has two blast furnaces, "A" Blast Furnace and "B" Blast Furnace. The blast furnace process is used to transform iron ore into raw molten iron. In the process iron ore, scrap and other metallics, coke and other carbon containing materials, limestone, and other fluxes (referred to as the burden) are loaded into the blast furnace where they slowly descend. Near the bottom of the furnace through the tuyeres, blast air is blown into the furnace and rises up through the burden. Blast air is high temperature air blown into the furnace in high volumes supporting the burden. At times, liquid materials such as oils or natural gas can be injected through the tuyeres with the hot blast as an additional source of carbon.

In the furnace, the hot blast air and the carbon in coke, oils, or natural gas react to form carbon monoxide. In the presence of carbon monoxide, the iron oxide in the iron ore reduces to metallic iron. In general, the reactions occurring in the Blast Furnace are described as follows:

$$Fe_2O_3 + 3\ CO \rightarrow 2\ Fe + 3\ CO_2$$

$$CO_2 + C \rightarrow 2\ CO$$

The result is molten iron, molten slag (calcium oxides and impurities), and a by-product gas rich in carbon monoxide called BFG. The BFG is collected at the top of the Blast Furnace and cleaned in a dust catcher and gas cleaning system. BFG is then utilized as a high volume, low heat content fuel at the Facility. BFG combustion is further described in Section 2.3 below.

Impurities in the Blast Furnace process include silica and sulfur. The majority of these materials are carried out of the process in the slag. Based on recent testing, US Steel estimates that approximately 80 % of the sulfur in the Blast Furnace Burden is bound up in the slag and transferred to the slag pits. Another 8 % of the sulfur remains in the iron and is removed prior to conversion of the iron to steel in the Basic Oxygen Furnace (BOF) Shop. Another 4 % of the sulfur is carried out in the flue dust and is removed by the dust catcher. An additional 8-9 % of the sulfur is removed in the BFG with 4 % being cleaned by the gas cleaning system and 4 to 5 % remaining in the BFG.

2.2 BLAST FURNACE CASTING

Iron and slag are cast through a tap hole drilled in the bottom of the furnace. Molten iron and slag pours through the tap hole into the trough. The iron and slag is separated and then flows through runners in the casthouse floor. Some of the runners are covered to minimize emissions. The runners direct the iron to a spout where the iron is poured into an iron ladle. The iron ladle is transported via train to the steel shop for conversion to steel. This process is called casting.

The molten slag flows through slag runners and is directed to a pit. While in the pit the slag is cooled using a water spray. Cooled slag is loaded via front-end loader to a truck and shipped off-site as a by-product material.

2.3 BLAST FURNACE GAS COMBUSTION

BFG has a low heat content ranging from under 60 to more than 100 million British thermal units per standard cubic foot of gas (MMBtu/scf). At the Granite City Works, BFG is permitted to be combusted in the Blast Furnace Stoves, Boilers 1-12, and the BFG Flare. Any BFG the Facility is unable to combust for usable heat in the Blast Furnace Stoves or Boilers is combusted in the BFG Flare. The Facility does not store or ship BFG off-site.

The BFG collected at the top of the Blast Furnaces is piped to a dust catcher and a gas cleaning system to remove particulate from the BFG. The Blast Furnace Permits (IEPA Nos. 72080034 & 72080036) require the dust removal system remove particulate to less than 0.01 grains per dry standard cubic foot (gr/dscf). After the bulk of the dust is removed, the BFG is piped to various combustion devices in the facility to be used as a fuel.

BFG has small amounts of sulfur bearing compounds that cause the creation of SO_x compounds during combustion. Analysis of BFG fuel samples indicates BFG sulfur levels currently range from 20 to 50 ppmv of sulfur compounds. As described previously, recent testing of the relationship between sulfur in the Blast Furnace burden and sulfur in the BFG indicates that as much as 5 % of the sulfur in the burden ends up in the BFG after the dust cleaning system. Based on typical sulfur levels for the Blast Furnaces, this results in emissions of SO_x of 16 lbs. per MMcf of BFG combusted.

2.4 CHANGES REQUIRED IN THE PRODUCTION INCREASE PERMIT

The Production Increase Permit (IEPA Permit No. 95010001) allows the facility to combust up to 30,800 million cubic feet (MMcf) of BFG per month and 185,030 MMcf of BFG per year resulting in up to 615.22 tons per year of SO_2 from all BFG combustion units. This limitation was based on an emission factor used for an ACME Steel Permit. Based on US Steel's own recent testing, US Steel now believes the ACME Steel emission factor does not accurately represent the nature of SO_2 emissions from BFG combustion at the Granite City Works either now or at the time of the permit issuance.

The ACME Steel SO_2 emission factor was used as the best available estimate of BFG SO_2 emissions available at the time. However, based on recently developed data, the ACME SO_2 factor underestimated both the actual emissions and the proposed emission increase identified in the Production Increase Permit application. Therefore, US Steel seeks to revise the Production

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Increase Permit (95010001) to account for US Steel's revised method for calculating the SO_2 emission rate from BFG combustion. This will increase the total allowable emissions of SO_2 on an annual basis from the combustion of BFG in the Production Increase Permit.

In accordance with this request for modification of the Production Increase Permit, US Steel has included a revised calculation of SO_2 emission increases from BFG combustion and a revised analysis of BACT. Revised ambient air quality modeling for the Production Increase Permit Application is presented in Section Six.

3.1 AFFECTED EMISSION UNITS

This application includes emission estimates for the seven (7) BFG combustion sources listed below:

BFG Combustion Sources

- Blast Furnace "A" Stoves
- Blast Furnace "B" Stoves
- Boilers 1-7
- Boilers 8-10
- Boiler 11
- Boiler 12
- Blast Furnace Gas Flare.

These sources will require changes to the BFG Combustion emission limit in the Production Increase Permit (IEPA Permit No. 95010001).

3.2 EMISSION FACTORS / PERMITTED LIMITS

The Production Increase Permit limits SO_2 emissions from the Blast Furnace Casting Sources as well as from the combined combustion of all BFG at the facility. The existing SO_2 limits in the Production Increase Permit are detailed below:

- Casthouse Baghouse — 422 tons SO_2 per year
- Uncaptured Casthouse Fugitives — 21.94 tons SO_2 per year
- Slag Pits — 15.83 tons SO_2 per year
- Iron Spout Baghouse — 13.89 tons SO_2 per year
- BFG Combustion (185,030 MMcf/yr) — 615.22 tons SO_2 per year

As discussed in Section 2.4, US Steel requests to revise the Production Increase Permit emission limits based on recent testing that shows that approximately 5 % of sulfur in the blast furnace burden travels with the BFG through the gas cleaning devices. Based on this calculation method, the Production Increase Permit should have based SO_2 emissions from BFG combustion on an emission factor of 16 lbs. SO_x / MMcf of BFG combusted. This emission factor is representative of the typical sulfur burden in the blast furnaces prior to and after the issuance of the Production Increase Permit.

3.3 EMISSIONS INCREASES

Average actual BFG combustion volumes prior to the Production Increase Permit Application were 121,039 million cubic feet (MMcf). The Production Increase Permit limits the total volume of BFG combustion to 185,030 MMcf. Using the recently calculated emission factor for BFG combustion of 16 lbs. SO_x per MMcf results in a potential emission increase of 511.93 tons SO_x per year from the combustion of BFG. This is the corrected increase for BFG combustion from the original Production Increase Permit Application of which 212.77 tons was previously accounted for in the Production Increase Permit. US Steel believes that the 16 lbs. SO_x per MMcf emission factor used here to develop the revised BFG emission increase should have been used in the 1994 Production Increase Permit and the associated increase has already occurred.

Using the revised emission factor and the permitted BFG consumption rate, the proposed Production Increase Permit limit for BFG combustion emissions of SO_2 is 1,480.24 tons per year.

An analysis of the actual BFG combustion SO_x emissions that have occurred since the Production Increase Permit indicates that the actual emissions increases are much lower than the 511.93 tons of SO_x per year potential increase. In fact, the actual emission increase that has occurred at the Granite City Works is lower than the 212.77 ton per year increase that was permitted in 1995. The table below compares the actual emissions since the Production Increase Permit (PIP) compared to the Pre-Production Increase Permit levels.

CO and VOM emission factors for the combustion of NG identified in the Production Increase Permit are from earlier revisions of AP-42. AP-42 factors for CO and VOM have increased to 84 and 5.5 lbs/MMscf. Based on the NG throughput permit limit in the Production Increase Permit of 1,346 MMscf per year, emissions of CO and VOM would be 56.53 and 3.70 tons per year, respectively. Even without considering baseline emissions, this would not result in a significant increase in either pollutant. Therefore, US Steel requests the permit be modified to include the revised emission factors and new permit limits.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Table 3-1: Revised Analysis of SO_x Emissions Changes Resulting from Production Increase Permit

Analysis Year	BFG Prod. (MMscf)	$S0_x$ Emission Factor (lbs./mmscf)	SO_x Emissions (tpy)	Actual Annual Change from Pre PIP Levels (tpy)
Pre-PIP	121,039	16.00	968.31	Baseline
1997	137,590	16.00	1100.72	132.41
1998	137,165	16.00	1097.32	129.01
1999	128,556	16.00	1028.45	60.14
2000	132,857	16.00	1062.86	94.54

2006	123,930	16.00	991.44	23.13

Note: BFG Production based on US Steel Granite City Works utility distribution spreadsheet for the years 1997 to 2006.

This section analyzes the federal and state air quality regulations potentially applicable to the Production Increase Permit application being revised. It also includes those regulatory exemptions that make potentially applicable rules inapplicable.

4.1 PRODUCTION INCREASE PERMIT APPLICATION

The change to the BFG combustion SO_2 emission rate in the Production Increase Permit application does not alter the applicable regulatory requirements analyzed in the original application. Based on the revised SO_2 emission increase calculation detailed in Section Three, this application contains all necessary information for a revised PSD analysis of the SO_2 emissions resulting from increased BFG production due to the production increase. As stated in Section One, the information required for the PSD analysis includes the analysis of BACT in Section Five and the additional impact analysis contained in Section Six. Ambient air quality modeling results are presented in Section Six.

Best Available Control Technology (BACT) is defined in 40 CFR 52 Subpart A Paragraph 52.21(b)(12) as an emissions limitation based on the maximum degree of reduction for each pollutant subject to regulation under the Act which would be emitted from any proposed major stationary source or major modification which the Administrator, on a case by case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such source or modification through application of production processes or available methods, systems, and techniques, including fuel cleaning or treatment or innovative fuel combustion techniques for control of such pollutant. In no event shall application of BACT result in emissions of any pollutant, which would exceed the emissions allowed by any applicable standard under 40 CFR Parts 60 and 61. If the Administrator determines that technological or economic limitations on the application of measurement methodology to a particular emissions unit would make the imposition of an emissions standard infeasible, a design, equipment, work practice, operational standard, or combination thereof, may be prescribed instead to satisfy the requirement for the application of BACT. Such standard shall, to the degree possible, set forth the emissions reduction achievable by implementation of such design, equipment, work practice or operation, and shall provide for compliance by means which achieve equivalent results.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

BACT is required for each regulated pollutant emitted from a major source in excess of significant emission rates. Individual BACT determinations are to be performed for each new or modified emission unit emitting the PSD pollutant. The BACT determination must address, for each regulated pollutant with a significant emission increase at the source, air pollution control technologies capable of reducing emissions of the pollutant.

Preparation of the BACT analysis included in this document incorporates the most recent "top-down" BACT guidance (EPA,1990) by United States Environmental Protection Agency (EPA) for PSD permit determinations. That is, for each pollutant, the most stringent emission limit potentially applicable for a given pollutant was considered and then compared to the proposed project to determine its technical and economic feasibility.

When the most stringent technically feasible emission limitation is not selected as BACT, justification must be provided in terms of adverse economic, environmental, or energy impacts. Several other factors may be considered in justification of rejecting more stringent controls, including:

A showing that utilizing the control would adversely impact the project's financial viability.

A showing that the costs associated with the control are significantly higher for this specific project than for other similar projects that have installed this control system or in general for controlling the pollutant.

A showing that those economic considerations outweigh the energy and environmental benefits.

5.1 SO_2 CONTROL TECHNOLOGY REQUIREMENTS AND APPLICABILITY

The sources of SO_2 emissions impacted by the revised production increase analysis include the Blast Furnace Stoves, the Blast Furnace Flare and Boilers 1 –12.

5.2 INHERENTLY LOWER-EMITTING PROCESSES/PRACTICES

5.2.1 Blast Furnace Gas Combustion Units

Under the Production Increase Permit, increased amounts of BFG combustion were identified as a by-product of the increased production of iron in the blast furnaces. The original Production Increase Permit was based on the BACT analysis showing that BFG is a low sulfur fuel as a result of the natural removal of sulfur in the blast furnace process (see Section Two). The revised estimate of SO_2 concentrations in BFG identified in this application does not alter that finding. BFG is still a low sulfur fuel with concentrations of H_2S on the order of 30 parts per million on a volume basis (ppmv) in the fuel. This is equivalent to less than 0.02 grains of H_2S per dry standard cubic foot of BFG (gr/dscf). For comparison pipeline natural gas (NG) has

sulfur levels of 0.002 gr/scf of NG, raw coke oven gas (COG) has sulfur levels of around 4 gr/dscf and desulfurized COG has sulfur levels of around 0.25 gr/dscf.

Due to the low concentrations of SO_2 and other pollutants in BFG and NG, these fuels are considered clean burning fuels. Although BFG emits higher levels of SO_2 than NG, substituting NG at combustion units burning BFG such as the Blast Furnace Stoves or Boilers results in the combustion of additional BFG at the flare. By combusting BFG at the Blast Furnace Stoves and Boilers in the largest quantities that operating conditions allow, the facility minimizes SO_2 emissions by limiting NG and fuel oil combustion requirements. Therefore, combustion of the BFG in the Blast Furnace Stoves and Boilers is inherently the lowest emitting practice on a plant-wide basis.

5.3 SO_2 CONTROL TECHNOLOGY OPTIONS

When dealing with SO_2 control in combustion devices the most widely utilized add-on controls are fuel sulfur removal technologies and post-combustion SO_2 removal technologies. However, because of the unique nature of BFG, there are no add-on SO_2 control technologies currently in use in the steel industry for SO_2 control at combustion units using process BFG.

In addition to BFG being a low sulfur fuel, BFG is a low Btu fuel (approximately 80 Btu/cubic feet). Because of its low Btu value, large volumes of BFG are necessary to produce the same amount of heat input as higher heat content fuels such as NG or fuel oil. The BFG produced by Granite City Works is produced and consumed in large volumes (approximately 500 MMscf per day at rated capacity) with low concentrations of sulfur compounds and low heat content. The high volume and low Btu value make the processing of this fuel or its exhaust very difficult.

As a result, no known use of fuel sulfur removal technologies have been identified for low sulfur fuels such as BFG. Because of the high volumes and low concentration of H_2S in BFG, the additional removal of fuel sulfur would be prohibitively expensive.

Additionally, due to the low heat value for BFG and the low H_2S concentration of the uncombusted fuel, exhaust gases from BFG combustion typically contain less than fifty (50) ppmv of SO_2. No instances of SO_2 control of exhaust gases has been identified for such low concentrations of SO_2 in stack gases.

Based on a review of the BACT/LAER clearinghouse, information obtained from the U.S. EPA Control Technology Group, and literature from the U.S. EPA Office of Air Quality Planning and Standards, no add-on BACT determination has been made for SO_2 emissions at BFG combustion sources. Due to the low concentrations of H_2S in BFG and SO_2 in combustion stacks, control of SO_2 emissions at BFG combustion units is not practiced in the steel industry.

A review of BACT determinations for other in-plant by-product fuel sources indicates that refinery fuel gas BACT determinations for four (4) refinery fuel gas combustion devices were based on the use of low sulfur fuel with H_2S concentrations of 0.1 gr/dscf or greater. No fuel sulfur removal technologies or post combustion controls were required for these BACT determinations. The refinery by-product fuels permitted in these BACT determinations all have higher fuel sulfur levels than BFG. These BACT determinations are shown in the table below.

Table 5-1: Previous BACT Determinations

RBLC ID	Fuel	Date	SO_2 limit (lb/mmBtu)	Additional Limit Information
TX-0415	Refinery Gas	3/4/1999	0.0035	Refinery gas limit: 160 PPMV hydrogen sulfide
TX-0375	Petro Refinery Gas	3/14/2002	0.025	Low S fuel: fuel gas with H_2S content no more than 0.1 gr/dscf over a 3 hr rolling basis
LA-0166	Refinery Gas	1/10/2002	0.027	Low sulfur refinery fuel gas equivalent to approximately 0.1 gr/dscf based on TX-0375
LA-0149	NG and Refinery Gas	10/21/1999	0.04	Use of low sulfur fuel equivalent to greater than 0.1 gr/dscf based on TX-0375

5.3.1 Infeasible Control Options

The permitted production increase resulted in increased BFG generation and corresponding increased BFG combustion in the BFG combustion sources. BFG and NG are considered clean fuels and are the preferred supplemental fuels for the increased combustion needs based on inherently lower emitting practices.

Because BFG is produced and consumed on-site in the Blast Furnace Stoves, Boilers or in the Blast Furnace Flare, substitution of BFG with a lower sulfur fuel in the Blast Furnace Stoves or Boilers is deemed infeasible. Substituting a lower sulfur fuel such as NG in these units does not reduce BFG combustion at the facility. All BFG produced at the Granite City Works is combusted. Substituting NG for BFG results in additional SO_2 emissions from NG combustion at those units and shifts SO_2 emissions from BFG combustion to the Blast Furnace Flare. Therefore, fuel substitution is considered infeasible.

Because of the high volumes and low concentrations of sulfur compounds in the BFG, fuel sulfur removal is deemed infeasible. No BACT analysis of by-product fuels has determined that fuel sulfur removal is feasible for a fuel sulfur level less than 0.1 gr/dscf. BFG has a fuel sulfur level of less than 0.02 gr/dscf and the removal of sulfur below this level is deemed infeasible.

Post combustion control of SO_2 from BFG combustion is deemed infeasible due to the high exhaust volumes and low SO_2 concentrations in stack gases. Removal of SO_2 at levels below the

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

existing fifty (50) ppmv could not be accomplished in an economical manner due to the extremely high exhaust volumes.

5.4 SELECTED BACT – SO_2

The BACT selected is the use of the inherently lower emitting practice of combusting BFG to the extent possible at BFG combustion units. No post combustion or fuel sulfur removal technologies are required.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

6.1 INTRODUCTION

Under the New Source Review (NSR) process, major stationary sources must demonstrate that undergoing a major modification will not cause or significantly contribute to an exceedance of the National Ambient Air Quality Standards (NAAQS). NSR also requires the source to demonstrate that emissions of specific pollutants such as SO_2 will not deteriorate the existing air quality above incremental amounts established by the Clean Air Act (CAA).

The Prevention of Significant Deterioration (PSD) program is a part of the NSR process that states have implemented for major new and modified sources of air pollution in regions currently in attainment of the NAAQS. An air quality impact assessment is one of the requirements which must be completed in order to receive a PSD permit to modify a source. The air quality analysis presented in this section satisfies the requirements in the Code of Federal Regulation 40 CFR 52.21(k) and 40 CFR 52.21(m).

6.2 HISTORY

The air quality impact assessment for the Production Increase Permit was performed for the SO_2 emission increase plant-wide in the original permit application as required under PSD. That air quality impact assessment has been revised for this application for a permit modification to show that no adverse air quality impacts have occurred or will occur as a result of the revised BFG combustion SO_2 emission rate proposed for the Production Increase Permit. Consequently, this section shows that despite the erroneous SO_2 emission rate identified in the original permit application, the Production Increase Project did not cause or significantly contribute to any exceedance of the NAAQS nor did it result in a deterioration of existing air quality above incremental amounts established by the CAA.

The permit application for the original Production Increase Permit relied in part on extensive dispersion modeling conducted by the Illinois Environmental Protection Agency (IEPA) in and around the Granite City Works (GCW). The purpose of the IEPA modeling was to demonstrate NAAQS attainment for SO_2 and particulate matter. The IEPA modeling successfully demonstrated NAAQS compliance based on Federally Enforceable State Operating Permit (FESOP) SO_2 emission rates for the Granite City Works. SO_2 emission rates included in the Production Increase Permit for the combustion of BFG (IEPA Permit No. 95010001) were no greater than the SO_2 FESOP limits (IEPA Permit No. 94120017) and therefore did not affect the SO_2 attainment demonstration modeling conducted by the IEPA. For this reason, the 1995 Production Increase Permit Application did not need to demonstrate NAAQS attainment for SO_2.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

The permit limits included in the SO_2 FESOP limited SO_2 emissions from the combustion of coke oven gas (COG) at each COG combustion unit. Because COG combustion results in higher SO_2 emissions than BFG combustion on an equivalent heat input basis, this permit effectively limited total SO_2 emissions from the facility. Replacing COG with BFG at emission units that burn both COG and BFG results in lower SO_2 emissions from those units because BFG has a much lower sulfur content. Because the Production Increase Permit affected only BFG production and BFG emissions and did not affect COG production or COG emissions, there was no need to repeat the SO_2 FESOP modeling NAAQS demonstration.

Although the revised SO_2 emission rates for BFG combustion in this application are higher than those rates used for developing limits in the Production Increase Permit, the revised BFG SO_2 emission rates are still much lower than the COG SO_2 emission rates on a lb/MMBtu basis. Therefore the BFG SO_2 emission rates will not affect the SO_2 emission limits in the SO_2 FESOP as COG combustion will still result in higher emissions than BFG. However, after preliminary discussions with IEPA, it was determined that a NAAQS demonstration would be required to modify the BFG SO_2 emission limit in addition to a revised PSD Increment analysis. As a result, this section of the application details the NAAQS demonstration and the PSD Increment analysis conducted.

In the discussion below, Granite City Works details the air quality modeling analysis that was conducted to demonstrate that the revised emission rates for the Production Increase Permit will not result in significant contributions to violations of the National Ambient Air Quality Standard nor any deterioration of existing air quality above SO_2 increment levels for Class II areas. The applicable SO_2 NAAQS and Class II area SO_2 increment levels are detailed in Table 6-1 below.

Table 6-1: National Ambient Air Quality Standards for SO_2 ($\mu g/m^3$)

Significance Level Or NAAQS	Averaging Period		
	3-hour	24-hour	Annual
Significance Level	25	5	1
NAAQS	1300	365	80
Class II Increment	512	91	20

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

6.2.1 Air Quality Analysis

The dispersion model used for assessing the air quality impacts from the facility is the USEPA's AERMOD (version 07026), which is incorporated into Beeline Software's modeling package BEEST (version 9.60a).

The AERMOD model was selected primarily for the following reasons:

- The EPA and IEPA have approved the general use of the model for air quality dispersion analysis because the model assumptions and methods are consistent with those in *Appendix W to Part 51 – Guideline of Air Quality Models* (EPA, 2005).
- The model calculates plume rise as a result of momentum, buoyancy, and variations of wind speed with height.
- Building downwash and wake effects as well as stack tip downwash are calculated and incorporated into the model.
- The AERMOD model is capable of predicting the impacts from stack, area, and volume sources that are spatially distributed over large areas and located in flat or gently rolling terrain.
- The outputs of the AERMOD model are appropriate for addressing compliance with NAAQS and PSD increments.

The model calculates concentrations due to point, area, and volume sources based on using the steady-state Gaussian plume equation for a continuous source in the horizontal and vertical stable conditions, and the non-Gaussian probability density function in the vertical dimension for unstable conditions.

AERMOD operates in three units. The first is AERMET, a meteorological data preprocessor that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts as discussed in Section 1.1. The next is AERMAP, a terrain data preprocessor that incorporates complex terrain using United States Geological Survey (USGS) Digital Elevation Data as discussed in Section 1.2. The final unit, AERMOD, is the air dispersion modeling unit as discussed in Section 1.3.

6.3 METEOROLOGICAL DATA PREPROCESSING

6.3.1 Dispersion Coefficients/Land Use Classification

The surface data collection point, St. Louis Lambert Airport, and the anchor location, US Steel – Granite City Works, are categorized as having urban and rural land characteristics for a 3 km

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

radius at each site according to *Appendix W to Part 51- Guideline on Air Quality Models* (EPA, 2005). The procedure to determine land-use sectors is described below:

> *Land Use Procedure: (1) Classify the land use within the total area, A_0, circumscribed by a 3 km radius circle about the source using the meteorological land use typing scheme proposed by Auer; (2) if land use types I1, I2, C1, R2, and R3 account for 50 percent or more of A_0, use urban dispersion coefficients; otherwise, use appropriate rural dispersion coefficients.* (Appendix W to Part 51- Guideline on Air Quality Models, USEPA, 2005)

Based on aerial photos, the area surrounding Lambert Airport was classified as possessing urban and rural characteristics. This area is categorized into two sectors. The first sector is to the east-southeast, which includes the runway. The area in this sector has a decreased surface roughness, a medium albedo, and a medium bowen ratio. The second sector appears to be more urban in nature and therefore has a high surface roughness, a medium albedo, and a high bowen ratio.

The basic site characteristics for US Steel – Granite City Works are similar to the Lambert site characteristics and both can be split into two sectors. One sector, to the east-southeast from 105 to 135 degrees, has a decreased surface roughness, a medium albedo, and a medium bowen ratio. The urban land-use albedo values, and the average of the bowen ratio and surface roughness values for urban and cultivated land use were selected for the first wind sector. The second sector was classified as urban with a high surface roughness, a medium albedo, and a high bowen ratio. Urban surface characteristics were selected for the second sector.

Tables 4-1 through 4-3 from the *User's Guide for the AERMOD Meteorological Preprocessor (AERMET)* identify surface characteristics by season. Section 4.7.7 of the guide identifies the seasons as on a latitude and vegetative growing cycle.

> *Spring refers to the period when vegetation is emerging or partially green and applies to the 1-2 months after the last killing frost. The term summer applies to the period when vegetation is lush. The term autumn refers to the period of the year when freezing conditions are common, deciduous trees are leafless, soils are bare after harvest, grasses are brown and no snow is present. Winter conditions apply to snow-covered surfaces and subfreezing temperatures.*

Therefore, the seasons were identified as the following months for the facility:

- Spring: March, April and May
- Summer: June, July, August, and September

- Autumn: October and November
- Winter: December, January and February.

Table 6-2 shows the surface albedo, bowen ratio, and surface roughness for each month and each sector of the 3 km radius from the facility.

Table 6-2: Dispersion Coefficient Input Parameters

Time Frequency	Wind Sector	Surface Albedo	Bowen Ratio	Surface Roughness
January	1	0.35	1.5	0.505
January	2	0.35	1.5	1
February	1	0.35	1.5	0.505
February	2	0.35	1.5	1

November	2	0.18	2	1
December	1	0.35	1.5	0.525
December	2	0.35	1.5	1

6.3.2 Meteorological Data

The *Guideline on Air Quality Models* (EPA, 2005) recommends the use of representative meteorological data for use in air quality modeling from the most recent readily available 5-year period.

Surface meteorological data was retrieved from www.webmet.com for the St. Louis Lambert Airport Weather Station, WBAN 13994, in SCRAM format for the years 1987 to 1991. The station location description is 38.752° latitude and 90.374° longitude.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

The St. Louis Lambert Airport Weather Station is approximately 11 miles north northwest of the facility. Because of the proximity, similar terrain, prevailing wind direction, and similar climate of this station compared to the facility, the St. Louis Lambert Airport Weather Station meteorological data is considered representative of meteorological conditions occurring at the facility.

Upper air data was retrieved from www.webmet.com for the Peoria Airport, WBAN 14842, in TD 6201 format for the years 1987 to 1991. The station location description is 40.667° latitude and 89.684° longitude.

Surface meteorological data was reviewed for quality assurance and quality control purposes in accordance with recommendations in the *Guideline on Air Quality Models* (EPA, 2005). Calm wind conditions were observed in the upper air meteorological data, however, no adjustment to wind data is required for the input of surface meteorological data into AERMOD. According to the guideline, "None of the observed wind speeds in a measured wind profile that are less than the threshold speed are used in construction of the modeled wind speed profile in AERMOD."

Meteorological Monitoring Guidance for Regulatory Modeling Applications (EPA, 2000) provides information for the treatment of missing or invalid data. Meteorological data must be 90% complete before substitution of any missing data. AERMET reviewed the surface meteorological variables of dry bulb temperature, wind direction, and wind speed for completeness and exceedance of upper and lower data limits. The surface meteorological data was more than 90% complete for all years and variables reviewed. No variables were missing for the surface meteorological data, however a limited amount of data did exceed upper and lower boundary limits. It was not necessary to treat the data that exceeded upper and lower limits since AERMET flags the data for processing in AERMOD.

AERMET reviewed the upper air meteorological variables of dry bulb temperature, wind speed, and dew point for completeness and exceedance of upper and lower data limits. As part of the QA AERMET also checks for calm winds, zero wind speeds, dew point greater than dry bulb temperature, and unusual (though possibly valid) lapse rates. Several variables were missing for the upper air data. However, the reviewed guidance is not applicable to upper air data, and therefore, missing and invalid upper air data was not treated. AERMET flags the missing and invalid upper air data for processing in AERMOD.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

6.4 TERRAIN DATA PROCESSING

Terrain data was obtained in DEM format from Micropath Corporation. This data was selected for use in AERMAP to calculate the base elevations for the sources, buildings, and receptors in UTM coordinates (zone 15 NAD 83 datum). AERMAP also calculates the local terrain maximum for the receptors based on the highest node exceeding the 10% slope from the receptor. The local terrain maximum and the base elevation of the receptor set a Gaussian terrain profile for the AERMOD calculations.

6.5 AERMOD OPTIONS

EPA regulatory default options including final plume rise, stack tip downwash, buoyancy-induced dispersion, default wind profile exponents, default temperature gradients, and calms processing were used for all model runs. The modeling runs were setup to include consideration of potential downwash effects in accordance with the algorithms used in the AERMOD model.

6.5.1 Downwash Considerations

The Building Profile Input Program Plume Rise Model Enhancement (BPIP-Prime) was used to calculate the downwash using wind direction specific building dimensions for the nearby buildings. Downwash considerations take into account air downwash caused by winds hitting nearby buildings and increasing pollutant concentrations near the source.

The building dimensions were obtained from US Steel – Granite City Works facility drawings or measured by Granite City Works personnel. When multiple buildings were in sufficient proximity to each other to create only narrow paths between large building complexes, only one building was modeled with an average building height to keep the complexity of the model to a minimum. Granite City Works provided stack heights.

6.5.2 Receptor Grid

For the AERMOD model runs, the receptor grid consisted of receptors spaced every 50 meters along the fence line of the plant property. In addition, a Cartesian receptor grid with the following spacing was developed:

- 100 meter spaced grid surrounding fenceline out to 400 meters from the east and west fencelines and 200 meters from the north and south fencelines.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

- 500 meters spacing from the fenceline out to approximately 3 kilometers (km) from the source.
- 1000 meter spacing from the fenceline out to the distance where the pollutant concentrations continually decrease.

6.6 NAAQS MODELING SOURCE PARAMETERS

6.6.1 U.S. Steel – Granite City Works Sources

Granite City Works' source stack parameters for point sources included in the NAAQS modeling are detailed in Table 6-3. Parameters for area sources included in the NAAQS modeling are detailed in Table 6-4. Stack parameters for each source were identified from previous modeling, engineering calculations, and stack test data as available. Sources venting through roof vents and open pits were modeled as area sources. Stack and area source locations were determined by super-imposing facility drawings on USGS quadrangles and verified using a handheld GPS unit when needed.

The initial modeled SO_2 rates are based on several conservative assumptions. Modeled SO_2 emission rates initially assume COG production is sufficient to meet maximum allowable inputs for all units using COG. It also assumes unlimited BFG production. Short term COG SO_2 emission rates also assume 454 grains H_2S per 100 SCF of COG which is assumed to be worst case non-desulfurized gas. Because of the conservative COG production assumptions, USS has modeled 2.8 times the amount of COG it can produce at maximum coke production levels. The detailed calculation of the emission rates used in the NAAQS demonstration modeling is included as Appendix C.

Table 6-3: Point Source Stack Parameters

Stack No.	Description	Easting (m)	Northing (m)	Base elevation (m)	Stack Height (m)	Stack Temp (K)	Exit Velocity (m/s)	Stack Diameter (m)

6.6.2 Illinois Background Sources

IEPA provided two SO_2 background source datasets to USS for inclusion in the NAAQS modeling. One dataset was for short-term modeling and the second dataset contained annualized emission rate data. Some of the data provided by IEPA was in UTM Zone 16 coordinates based on the NAD 27 coordinate datum. Previous modeling data developed for USS sources was based on the contemporary NAD 83 coordinate system using UTM Zone 15 coordinates because the Facility is located in Zone 15. Therefore, all IEPA background sources were changed to Zone 15 coordinates in the NAD 83 coordinate system to coincide with the USS data. The conversions to Zone 15 coordinates were verified using Google Earth when stacks could be identified and adjustments to stack locations were made if appropriate. The Illinois background sources and their short-term and long-term model parameters are detailed in Tables 6-5 and 6-6 below.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

6.6.3 Missouri Background Sources

Missouri background sources were requested from the Missouri Department of Natural Resources (MDNR). MDNR provided information on background sources in the out-state regions, however, MDNR indicated that modeling data on sources in the city and county of St. Louis would have to be provided separately by St. Louis City and St. Louis County. USS requested that St. Louis City and St. Louis County provide background and increment consuming SO_2 sources for PSD modeling and received only information on background sources. Background sources for St. Louis City and St. Louis County were then reviewed to screen out sources which did not meet IEPA's 10d=Q screening criteria.

The stack locations were verified using Google Earth when stacks could be identified and adjustments to stack locations were made if appropriate. Background sources located in the City of St. Louis meeting the IEPA screening criteria are shown in Table 6-7 below along with model data for both short term and long term averaging periods.

Table 6-7: City of St. Louis Background Source Data

Background sources located in St. Louis County meeting the IEPA screening criteria are shown in Table 6-8 below along with model data for both short term and long term averaging periods. The stack locations were verified using Google Earth when stacks could be identified and adjustments to stack locations were made if appropriate.

6.7 BACKGROUND SO_2 CONCENTRATIONS

Background SO_2 concentrations were developed from USEPA monitoring data available from the USEPA AirData website. Background SO_2 concentrations are based on average values for the second highest monitored 3-hour and 24-hour values over the 2004-2006 period from a monitoring site located in Wood River, IL (54 N. Walcott). Background for the annual averaging period was also determined from the mean annual concentrations for 2004-2006 at this monitor.

This location was chosen due to its proximity to Granite City, Il. Other potential monitoring sites which were excluded from use included the Wood River site at 1710 Vaughn Rd., South Roxana, IL (Michigan St.), the Granite City site and the East St. Louis Site. The Vaughn Rd. Wood River site was excluded due to its location to the north of a major petroleum refinery.

Likewise, the Michigan St. South Roxana site was not used to develop background SO_2 concentrations due to its location southeast of the same refinery. Because winds in the St. Louis region are predominantly out of the south and the west, these locations are largely downwind from the refinery. Therefore, the refinery is believed to affect the monitor values at these locations. Additionally, the refinery sources were included in the background sources supplied by IEPA. They were therefore included in the modeling and inclusion of these monitors to develop background concentrations may result in double counting resultant concentrations. The Granite City monitoring site was not chosen because that site was discontinued in 2001. The East St. Louis monitoring site was not chosen as it is believed to be influenced by a zinc refinery and chemical plants to the south which have been included in the background sources for the modeling.

The relevant monitor values and the resultant background values are shown in Table 6-10.

Table 6-10: Background Monitor Values and Proposed Background Values

Monitor Location	Year of Data	Monitor Values (ppm)		
		3-hr (high)	24-hr (High)	Annual Mean
54 N. Walcott	2004	0.041	0.018	0.004

Standard ($\mu g/m^3$)		1300	365	80

6.8 NAAQS MODELING RESULTS

The detailed results of each of the model runs are included in the sections below. USS GCW was able to meet SO_2 and NAAQS results for all three averaging periods.

6.8.1 NAAQS 3-Hour Averaging Period Model Results

The modeling was split into two runs in order to improve model run time. The near-field modeling contained the 100m and 500m grids described in section 6.5.2. The far-field modeling contained the 1000m grids described in section 6.5.2.

The results of the 3-hour model runs indicate that the Facility will not cause or significantly contribute to an exceedance of the 3-hour SO_2 ambient air quality standard when Slab Furnace 4 (Stack No. FIN0028s) is limited to 1,800 lbs. / 3-hours.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Using the conservative emission rate assumptions discussed in section 6.6.1 modeling of the 3-hour averaging period resulted in three receptors in the far-field receptor grid exceeding the 3-hour SO_2 NAAQS standard (1300 $\mu g/m^3$) in one or more years.

The model was run again with only the offending receptors. Each year was modeled individually in order to run the Events Model within AERMOD. The Events Model tracks any violation of a user-defined threshold concentration at any receptor, and then calculates individual contributions from each source to that violation, or "event." In this case the threshold was set at 1181 $\mu g/m^3$ (3-hour NAAQS standard of 1300 $\mu g/m^3$ minus background).

The Events Model output includes the contributions from each GCW source to each event. These contributions were summed to compare to the significance level. The significance level for the 3-hour NAAQS standard is 25 $\mu g/m^3$. Results of the 3-hour events modeling show no event had a GCW contribution greater than the significance level. Results from the 3-hour modeling are shown in Table 6-11.

Table 6-11: 3-hour Model Results ($\mu g/m^3$)

Year	Model Results High 2nd High	H2H with Background	NAAQS	Highest GCW Contribution to an Exceedance	Significance Level
1991	1877	1996	1300	< 1	25
1990	1876	1995	1300	< 1	25
1989	1961	2080	1300	< 1	25
1988	1915	2034	1300	< 1	25
1987	1953	2072	1300	< 1	25

6.8.2 24-Hour Averaging Period Model Results

The modeling was split into two runs in order to improve model run time. The near-field modeling contained the 100m and 500m grids described in section 6.5.2. The far-field modeling contained the 1000m grids described in section 6.5.2.

Using the conservative emission rate assumptions discussed in section 6.6.1, initial modeling of the 24-hour average SO_2 concentrations resulted in 15 receptors in the far-field grid violating the 24-hour NAAQS standard in one or more of the five years modeled. The model was run again with 500m grids around the offending receptors, resulting in 73 receptors. Each year was modeled individually in order to run the Events Model. In this case the threshold was set at 324 $\mu g/m^3$ (24-hour NAAQS standard of 365 $\mu g/m^3$ minus background). These initial results are presented in Table 6-12.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Table 6-12: Initial 24-hour Model Results ($\mu g/m^3$)

Year	Model Results High 2nd High	H2H with Background	NAAQS
1991	1305.3	1345.3	365
1990	1167.3	1207.3	365
1989	1115.2	1155.2	365
1988	1177.3	1217.3	365
1987	1240.1	1280.1	365

The Events Model output includes the contributions from each Granite City Works source to each event. These contributions were summed to compare to the significance level. The significance level for the 24-hour NAAQS standard is 5 $\mu g/m^3$. Reviewing the results of the 24-hour events model shows that of the 73 receptors exceeding NAAQS, 15 receptors had GCW contributions exceeding the significance level during events that exceeded the NAAQS standard.

Because initial modeling using the overly conservative assumptions described in section 6.6.1 resulted in modeling exceedances, USS developed less conservative assumptions for additional model runs. Additional model runs for the 24-hour averaging period were developed to remove the overly conservative assumption of unlimited COG availability. Because USS wishes to maintain the ability to shift COG to any unit modeling must show the worst case impacts from COG fuel use at this facility. In order to show the worst case impacts, four scenarios were developed, each containing the maximum potential COG production over a 24-hour period of 31.5 MMscf of COG. All four scenarios operate the coke oven batteries (A and B) at maximum COG underfire because this is necessary for maximum COG production. Scenario 1 diverts the remaining COG to the blast furnace stoves and the ladle dryer. Scenario 2 apportions the remaining COG to boilers 1-10. Scenario 3 distributes COG to the slab furnaces. Scenario 4 sends the remaining COG to boilers 11 and 12. The highest SO_2 emissions occur in scenario 3 because it maximizes BFG usage and minimizes NG usage (COG is approximately constant over the four scenarios). Since BFG has a higher sulfur contents than NG this results in the highest emissions. The emissions scenarios are presented in Table 6-13 (a) – (d).

The model was put through four more iterations, each representing one of these GCW emissions scenarios. Results from modeling with 500m resolution grids around offending receptors were analyzed to identify which receptors had events with both a NAAQS exceedance and a GCW contribution greater than significance. This narrowed the receptor grid down to 15 receptors for the scenario modeling. Each year and each scenario were modeled, utilizing the Events Model to obtain individual source contributions for every exceedance of the NAAQS standard. Source contributions from all GCW emissions units were summed for each exceedance in each scenario. Scenario modeling results are presented in Table 6-14.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Table 6-14: 24-hour Scenario Modeling Results – Maximum GCW Contribution to NAAQS Exceedance Events (µg/m^3)

Year	Scenario 1	Scenario 2	Scenario 3	Scenario 4
1991	3.2	3.1	3.3	3.3
1990	4.1	3.9	4.3	4.5
1989	2.8	2.8	2.9	2.9
1988	2.7	2.6	3.0	2.9
1987	3.7	3.6	3.3	4.1

Even though there are receptors which violate the NAAQS standard, using these emission scenarios the GCW facility does not have a contribution to those exceedances beyond the designated significance level.

6.8.3 Annual Averaging Period Model Results

The modeling was split into two runs in order to improve model run time. The near-field modeling contained the 100m and 500m grids described in section 6.5.2. The far-field modeling contained the 1000m grids described in section 6.5.2.

Modeling of the far receptor grid in the annual averaging period results in eight receptors exceeding the standard of 80 µg/m^3. At each receptor exceeding the annual standard the GCW contribution was compared to the significance level of 1 µg/m^3. GCW source contributions at all offending receptors remain less than the significance level. A summary of annual average modeling results is presented in Table 6-15.

Table 6-15: Annual Average Model Results (µg/m^3)

Year	Annual average	Annual average with background	NAAQS	GCW Contribution	Significance Level
1991	188	199	80	< 1	1
1990	185	196	80	< 1	1
1989	201	212	80	< 1	1
1988	209	220	80	< 1	1
1987	208	219	80	< 1	1

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

6.9 INCREMENT MODELING SOURCE PARAMETERS

Granite City Works' source emissions in the increment modeling are based on the incremental increase in emissions from the pre-Production Increase Permit SO_2 emission levels. The Production Increase Permit resulted in increases in SO_2 emissions from four (4) process sources. These sources were the Casthouse Baghouse, the Blast Furnace Casthouse uncaptured roof fugitives, the slag pits, and the Iron Spout Baghouse. Each of these sources saw incremental increases in SO_2 emissions as a result of the Production Increase Permit and was included in the increment modeling. Because these process sources are not affected by the revised emission factor, they were modeled using the same incremental emission rates as were modeled originally.

For BFG combustion sources affected by the increase in BFG production and the revised emission factor, emission rates were based on the difference between emissions at the revised BFG combustion SO_2 emission rate and the pre-Production Increase Permit BFG combustion levels. Under the Production Increase Permit, BFG combustion is limited to 185,030 MMcf per year. At the revised emission rate of 16.00 lbs. SO_2 per MMscf, 185,030 MMscf per year equates to 337.95 lbs. SO_2 per hour for 8,760 hours. At the pre-Production Increase Permit BFG combustion levels of 121,039 MMcf per year and the revised SO_2 emission rate, SO_2 emissions were 221.08 lbs. SO_2 per hour for 8,760 hours. Taking the difference between these SO_2 emission rates results in an increase of 116.88 lbs. SO_2 per hour (14.73 grams per second).

Because of the difficulty in dividing this increase between all BFG combustion emission sources, the full increase of 116.88 lbs. SO_2 per hour was attributed to each BFG combustion emission source for initial model runs. Because there are seven (7) BFG combustion stacks, this is the equivalent of modeling an incremental increase seven times what is proposed in this application. Using this method, the air quality increment consumption modeling will grossly over-predict the incremental impact of the BFG SO_2 combustion sources. This initial modeling resulted in exceedances of the PSD increment for the 24 hour averaging period at a limited number of receptors in the years 1987 and 1991.

Additional modeling was then performed for these receptors and these years to determine the worst case increment consumption under less conservative assumptions than made during the initial 24-hour model. The additional model runs included all GCW process sources and IL and MO increment consuming sources. Additionally it was assumed that either the boilers, Blast Furnace Stoves, or the Blast Furnace Flare would consume all the excess BFG. The results of this modeling are detailed in the section below.

The increment consuming emission rates are shown with the stack information in tables 6-16 and 6-17 below.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

6.9.1 IEPA and MDNR Increment Consuming Sources

At the time of the original application of the Production Increase Permit, no previous increment consuming sources had been identified. For this modification, stack and emission data on all increment consuming SO_2 sources were requested from IEPA and MDNR for the increment analysis. IEPA and MDNR have provided increment source data, however, the City and County Air Pollution Control Agencies' representatives refused to provide increment consuming source data. Based on multiple conversations with MDNR and county representatives, increment consuming source data would have to be developed independently by individually reviewing city and county air permits to determine what sources consumed increment.

URS reviewed lists of St. Louis City and St. Louis County Air Permits issued since the SO_2 baseline date (December 30, 1982) provided by IEPA. The permit listings were cross-referenced by permit date and permitted unit to facilities meeting IEPA screening criteria. Only facilities

with permitted SO_2 increases that met the IEPA screening criteria were included in the increment modeling. These sources are shown in the tables for Missouri Sources below.

Tables 6-18, 6-19 and **6-20** include information for Illinois and Missouri (short term and long term), respectively, on increment consuming sources for their jurisdictions included in the PSD increment analysis.

Table 6-18: Illinois Increment Consuming Source Parameters

IEPA Source No.	Easting m	Northing m	Base Elevation m	Stack Height m	Temp K	Exit Velocity m/s	Stack Diameter m	SO_2 Emission Rate g/s

6.9.2 PSD Increment Consumption Model Results

The results of the PSD increment consumption modeling analysis show that the SO_2 increments are not exceeded in the 3-hour or annual averaging periods when modeling is performed utilizing the revised production increase BFG SO_2 emission rate. The highest high concentration modeled for each averaging period and for each year is shown in Table 6-21 below compared to the allowable Class II SO_2 increment levels.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Table 6-21: Initial PSD SO_2 Increment Modeling Results

Year	Maximum Modeled SO_2 Concentrations ($\mu g/m^3$)		
	3-hr Ave.	24-hr Ave.	Annual Ave.
1987	143	94	14
1988	210	87	15
1989	143	90	13
1990	142	86	17
1991	141	91	14
Increment	512	91	20

Because a limited number of receptors in the 1987 and the 1991 model runs met or exceeded the 24-hour increment, additional runs were conducted for those receptors and those years. The additional model runs assumed the full incremental increase in SO_2 was emitted from each source in a group of sources instead of all sources as was modeled in the initial model run. Source groups modeled were the boilers, blast furnace stoves and the blast furnace flare. These groups were combined with the incremental emissions from the GCW process sources and the MO and IL increment consuming sources. The source groups and the modeled emission rates are shown in Table 6-22.

Table 6-22: Additional PSD Increment Modeling SO_2 Emission Rates

Group	Stack Number	Description	SO_2 Emission Rate g/s
Blast Furnace Stove Group	BF0007S	BF A Stove	14.727
	BF0012S	BF B Stove	14.727
Boiler Group	UT0053S	Boiler 1-7	14.727
	UT0054S	Boiler 8-10	14.727
	UT0059S	Boiler 11	14.727
	UT0064S	Boiler 12	14.727
BFG Flare Group	BF0011S	BFG Flare	14.727

Results from modeling using the above grouped source approach are shown in Table 6-23.

Table 6-23: Additional 24-hour PSD Increment Modeling Results

Year	Highest 24-Hour Increment Model Result (µg/m^3)		
	Boiler Group	Blast Furnace Group	BFG Flare Group
1991	79	60	60
1987	80	55	55
Increment	91	91	91

The results in Table 6-23 show the revised Production Increase Permit BFG emission rates will not result in exceedances of the 24-hour PSD increment.

The electronic modeling files are included in this application under Appendix D of this application in two CDs. The modeling files or this project have been separated into folders based on averaging periods, receptor grids, and details of the model runs. A description of the model runs in each folder is below.

SO2 NAAQS and PSD increment modeling files

FOLDERS:

- 3hr
  - SO2 modeling at the 3-hour averaging time
  - Using the near-field receptor grid

- 3hr-far
  - SO2 modeling at the 3-hour averaging time
  - Using the far-field receptor grid

- 24hr
  - SO2 modeling at the 24-hour averaging time
  - Using the near-field receptor grid

- 24hr-far
  - SO2 modeling at the 24-hour averaging time
  - Using the far-field receptor grid

- 24hr-far events
  - Subset of the 24hr-far modeling, utilizing a 500m grid around receptors exceeding NAAQS
  - Used Events Modeling to look at individual source contributions to exceedances

- 24hr-far-scenarios
  - Scenario modeling of SO2 at the 24-hr averaging period
  - Four different GCW emissions scenarios based on maximum COG production levels
  - Used Events Modeling to look at individual source contributions to NAAQS exceedances

- Annual
  - SO2 modeling of annual average concentrations
  - Using the near-field receptor grid

- Annual-far
  - SO2 modeling of annual average concentrations
  - Using the far-field receptor grid

- Increment modeling
  - SO2 increment modeling of the 3hr, 24hr and annual averaging periods
  - Both near and far grids in same model run

- Incrmt24
  - Additional modeling of the 24hr averaging period based on maximum increase in BFG production

FILE EXTENSION: DESCRIPTION

.BST: BEEST session file

.BND: contains information about fencelines, building and stack names for display

.DTA: model input data file

.GRF: master graphics file for display

.LST: model output list file

.MAX: maxi file specified in BEEST

.PRW: source and building data for BPIP-PRIME

.RUN: contains runtime information needed by AerMod

.SO: output file from BPIP-PRIME

.SUM: summary form of .SO file

.TAB: verbose form of .SO file

.USF: summary of model output created by BEEST

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

The original Production Increase Permit application concluded that the Production Increase Permit would not produce any adverse affects. It based this conclusion on the analysis required under 40 CFR 52.21(o). That analysis included a review of the additional impacts on the following:

1. Impacts on soils and vegetation that would result from the modification.
2. Impacts on air quality and visibility in Class I areas within 100 km of the project.
3. Impacts on endangered species.
4. Socioeconomic Impacts.

The analysis of these additional impacts resulting from the production increase has been reanalyzed in this application to determine to what extent, if any, it has been affected by the revised BFG combustion emission rate requested in this permit modification application. The review of the conclusions in the original Production Increase Permit application indicates that no additional adverse impacts would result from the requested revision of the IEPA issued Production Increase Permit. The analysis is detailed in the sections below.

7.1 SOILS AND VEGETATION ANALYSIS

Soils and vegetation analysis applies only to those areas in which there is vegetation of significant commercial or recreational value. There are no vegetation or soil types in the Granite City area which would be harmed by the proposed incremental increase in concentrations of SO_2 below the NAAQS. Therefore, no soils or vegetation analysis are required for the proposed revisions to the Production Increase Permit.

7.2 CLASS I AREA AIR QUALITY IMPACT ANALYSIS

The nearest Federal Class I area to the Granite City Works is the Mingo Junction National Wilderness Area approximately 210 km southwest of the facility. The next closest Class I area is Hercules-Glades approximately 330 km southwest of the Granite City Works mill. The distances from these Class I areas to the facility is greater than 100 km. Therefore, no air quality impact is to be expected and no analyses were performed to evaluate air quality impacts within the wilderness areas.

7.3 CLASS I AREA VISIBILITY IMPACT ANALYSIS

The nearest Federal Class I area to the Granite City Works is the Mingo Junction National Wilderness Area approximately 210 km southwest of the facility. The next closest Class I area is Hercules-Glades approximately 330 km southwest of the Granite City Works mill. The distances

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

from these Class I areas to the facility is greater than 200 km. Therefore, no visibility impact is to be expected and no analyses were performed to evaluate visibility impacts within the wilderness areas.

7.4 IMPACTS ON ENDANGERED SPECIES

Twenty-one (21) species are listed as endangered (11 species) or threatened (10 species) which are local to Madison County Illinois. These species are listed in **Table 7-1** below. None of these species are known, likely, or presumed to have habitat in or near this industrial facility. Because the proposed modification to the Production Increase Permit is a result of an error in the emission factor used to calculate the original permitted limit, the emissions changes resulting from the proposed modification have already occurred in the project area. No impacts to threatened or endangered species are known to have occurred since the permit was issued as a result of the SO_2 emissions from the facility. As a result, no impacts are expected to occur to any endangered or threatened species as a result of this permit modification.

Table 7-1: Illinois Endangered Species Specific to Madison County, IL

SCIENTIFIC NAME	COMMON NAME	ENDANGERED OR THREATENED
Acipenser fulvescens	Lake Sturgeon	Endangered Fish
Ammocrypta clarum	Western Sand Darter	Endangered Fish
Boltonia decurrens	Decurrent False Aster	Threatened Plant
Crotalus horridus	Timber Rattlesnake	Threatened Reptile
Egretta caerulea	Little Blue Heron	Endangered Bird
Ellipsaria lineolata	Butterfly	Threatened invertebrate
Falco peregrinus	Peregrine Falcon	Threatened Bird
Gallinula chloropus	Common Moorhen	Threatened Bird
Haliaeetus leucocephalus	Bald Eagle	Threatened Bird
Ixobrychus exilis	Least Bittern	Threatened Bird
Notropis boops	Bigeye Shiner	Endangered Fish
Nyctanassa violacea	Yellow-crowned Night Heron	Endangered Bird
Nycticorax nycticorax	Black-crowned Night Heron	Endangered Bird
Pseudacris streckeri illinoensis	Illinois Chorus Frog	Threatened Amphibian
Scaphirhynchus albus	Pallid Sturgeon	Endangered Fish
Silene regia	Royal Catchfly	Endangered Plant
Sistrurus catenatus	Eastern Massassauga	Endangered Reptile
Spiranthes vernalis	Spring Ladies' Tresses	Endangered Plant
Tradescantia bracteata	Prairie Spiderwort	Threatened Plant
Tropidoclonion lineatum	Lined Snake	Threatened Reptile
Xanthocephalus xanthocephalus	Yellow-headed Blackbird	Endangered Bird

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

7.5 SOCIOECONOMIC IMPACTS

The production increase at the Granite City Works has had a positive economic impact for the facility and the surrounding community. The industrial infrastructure surrounding the facility has been established over the many years of operation of the facility and will be unaffected by the proposed modification to the Production Increase Permit. Although the modification will not result in any additional employment or other positive socioeconomic impacts, no negative impacts are expected to result from the additional SO_2 emissions allowable under the proposed modification.

ILLINOIS ENVIRONMENTAL PROTECTION AGENCY
DIVISION OF AIR POLLUTION CONTROL -- PERMIT SECTION

Source Designation:
BFG Combustion

FUEL COMBUSTION EMISSION UNIT DATA AND INFORMATION

FOR AGENCY USE ONLY
ID NUMBER:
EMISSION POINT #:
DATE:

SOURCE INFORMATION

1) SOURCE NAME: United States Steel - Granite City Works

2) DATE FORM PREPARED:

3) SOURCE ID NO. (IF KNOWN): 119813AAI

GENERAL INFORMATION

4) NAME OF EMISSION UNIT: BFG Combustion Units (Boilers, Blast Air Stoves, and Flare)

5) NAME OF PROCESS: BFG Combustion

6) DESCRIPTION OF PROCESS: BFG Combustion to produce usable heat or flare when necessary

7) DESCRIPTION OF ITEM OR MATERIAL PRODUCED OR ACTIVITY ACCOMPLISHED: Produce steam or usable heat

8) FLOW DIAGRAM DESIGNATION OF EMISSION UNIT: BFG Combustion Units

9) MANUFACTURER OF EMISSION UNIT (IF KNOWN): Various

10) MODEL NUMBER (IF KNOWN):

11) SERIAL NUMBER (IF KNOWN):

12) DATES OF COMMENCING CONSTRUCTION, OPERATION AND/OR MOST RECENT MODIFICATION OF THIS EMISSION UNIT (ACTUAL OR PLANNED)

a) CONSTRUCTION (MONTH/YEAR): Various

b) OPERATION (MONTH/YEAR):

c) LATEST MODIFICATION (MONTH/YEAR):

13) DESCRIPTION OF MODIFICATION (IF APPLICABLE):

Revise BFG Combustion SO2 limit in Production Increase Permit based on new data indicating previous emission factor used to develop limit was incorrect.

THIS AGENCY IS AUTHORIZED TO REQUIRE THIS INFORMATION UNDER ILLINOIS REVISED STATUTES, 1991, AS AMENDED 1992, CHAPTER 111 1/2, PAR. 1039.5. DISCLOSURE OF THIS INFORMATION IS REQUIRED UNDER THAT SECTION. FAILURE TO DO SO MAY PREVENT THIS FORM FROM BEING PROCESSED AND COULD RESULT IN THE APPLICATION BEING DENIED. THIS FORM HAS BEEN APPROVED BY THE FORMS MANAGEMENT CENTER.

FOR APPLICANT'S USE

APPLICATION PAGE _____

14) DOES THE EMISSION UNIT HAVE MORE THAN ONE MODE OF OPERATION? ☐ YES ☒ NO

IF YES, EXPLAIN AND IDENTIFY WHICH MODE IS COVERED BY THIS FORM (NOTE: A SEPARATE PROCESS EMISSION UNIT FORM 240-CAAPP MUST BE COMPLETED FOR EACH MODE):

15) PROVIDE THE NAME AND DESIGNATION OF ALL AIR POLLUTION CONTROL EQUIPMENT CONTROLLING THIS EMISSION UNIT, IF APPLICABLE (FORM 260-CAAPP AND THE APPROPRIATE 260-CAAPP ADDENDUM FORM MUST BE COMPLETED FOR EACH ITEM OF AIR POLLUTION CONTROL EQUIPMENT):

None

16) WILL EMISSIONS DURING STARTUP EXCEED EITHER THE ALLOWABLE EMISSION RATE PURSUANT TO A SPECIFIC RULE, OR THE ALLOWABLE EMISSION LIMIT AS ESTABLISHED BY AN EXISTING OR PROPOSED PERMIT CONDITION? ☐ YES ☒ NO

IF YES, COMPLETE AND ATTACH FORM 203-CAAPP, "REQUEST TO OPERATE WITH EXCESS EMISSIONS DURING STARTUP OF EQUIPMENT".

17) PROVIDE ANY LIMITATIONS ON SOURCE OPERATION AFFECTING EMISSIONS OR ANY WORK PRACTICE STANDARDS (E.G., ONLY ONE UNIT IS OPERATED AT A TIME):

BFG Combustion facility wide limited to 185,030 million cubic feet per year.

OPERATING INFORMATION

18) ATTACH THE CALCULATIONS, TO THE EXTENT THEY ARE AIR EMISSION RELATED, FROM WHICH THE FOLLOWING OPERATING INFORMATION, MATERIAL USAGE INFORMATION AND FUEL USAGE DATA WERE BASED AND LABEL AS EXHIBIT 240-1. REFER TO SPECIAL NOTES OF FORM 202-CAAPP.

19a) MAXIMUM OPERATING HOURS	HOURS/DAY: 24	DAYS/WEEK: 7	WEEKS/YEAR: 52	
b) TYPICAL OPERATING HOURS	HOURS/DAY: 24	DAYS/WEEK: 7	WEEKS/YEAR: 52	
20) ANNUAL THROUGHPUT	DEC-FEB(%):	MAR-MAY(%):	JUN-AUG(%):	SEP-NOV(%):

FIRING RATE INFORMATION

21a) RATED OR DESIGN HEAT INPUT CAPACITY (MILLION BTU/HR): Various

b) IS MORE THAN ONE FUEL FIRED AT A TIME? ☒ YES ☐ NO

IF YES, EXPLAIN:

21c) IF HEAT INPUT CAPACITY IS 100 MILLION BTU/HOUR OR GREATER, PROVIDE FURNACE VOLUME (CUBIC FEET)
NOTE: FURNACE VOLUME IS DEFINED AS THAT VOLUME BOUNDED BY THE FRONT FURNACE WALL WHERE THE BURNER IS LOCATED, THE FURNACE SIDE WATERWALL, AND EXTENDING TO THE LEVEL JUST BELOW OR IN FRONT OF THE FIRST ROW OF CONVECTION PASS TUBES.

	NATURAL GAS	FUEL OIL	COAL	OTHER
d) SINGLE FUEL (MAXIMUM - MILLION BTU/HOUR)				
e) SINGLE FUEL (TYPICAL - MILLION BTU/HOUR)				
f) COMBINED FUEL (TYPICAL - MILLION BTU/HOUR) (IF APPLICABLE)				

NATURAL GAS FIRING

22a) CURRENT ORIGIN OF NATURAL GAS:
☐ PIPELINE (FIRM CONTRACT) ☐ BY-PRODUCT, SPECIFY ORIGIN:
☐ PIPELINE (INTERRUPTIBLE SUPPLY CONTRACT) ☐ OTHER, - SPECIFY: _____

b) TYPICAL HEAT CONTENT (BTU/SCF):
1000

c) MAXIMUM CONSUMPTION	SCF/MONTH:	SCF/YEAR:
d) TYPICAL CONSUMPTION	SCF/MONTH:	SCF/YEAR:

OIL FIRING

23a) OIL TYPE (CHECK ONE):
☐ NO. 1 ☐ NO. 2 ☐ NO. 4 ☐ NO. 5 ☐ NO. 6
☐ OTHER, SPECIFY (INCLUDE GENERATOR OR SUPPLIER): _____

b) TYPICAL HEAT CONTENT: _____
☐ BTU/LB - OR - ☐ BTU/GAL

c) IS OIL USED ONLY AS A RESERVE FUEL? ☐ YES ☐ NO

d) TYPICAL SULFUR CONTENT AS FIRED (WT %):

e) TYPICAL ASH CONTENT AS FIRED (WT %):

f) MAXIMUM CONSUMPTION	GAL/MONTH:	GAL/YEAR:
g) TYPICAL CONSUMPTION	GAL/MONTH:	GAL/YEAR:

h) FIRING DIRECTION:
☐ HORIZONTAL ☐ TANGENTIAL ☐ OTHER, SPECIFY:

SOLID FUEL FIRING

*24a) SOLID FUEL TYPE (CHECK ALL THAT APPLY): ☐ SUB-BITUMINOUS COAL ☐ LIGNITE COAL ☐ BITUMINOUS COAL ☐ ANTHRACITE COAL ☐ OTHER, SPECIFY:

b) TYPICAL HEAT CONTENT AS FIRED (BTU/LB):	c) TYPICAL MOISTURE CONTENT AS FIRED (WT %):
d) TYPICAL SULFUR CONTENT AS FIRED (WT %):	e) TYPICAL ASH CONTENT AS FIRED (WT %):
f) TYPICAL FINES CONTENT (% LESS THAN 1/8 INCH):	g) IS THE COAL CLEANED? ☐ YES ☐ NO

h) HOW MUCH COAL REFUSE IS IN THE FUEL? (WT %):

i) MAXIMUM CONSUMPTION	TON/MONTH:	TON/YEAR:
j) TYPICAL CONSUMPTION	TON/MONTH:	TON/YEAR:

k) FIRING TYPE (CHECK ONE):
☐ TRAVELING GRATE ☐ SPREADER STOKER % REINJECTION:
☐ CYCLONE ☐ PULVERIZED, TYPE (CIRCLE ONE): WET BOTTOM DRY BOTTOM
☐ HORIZONTALLY OPPOSED ☐ OTHER, SPECIFY: _____

*NOTE: IF REQUIRED, SUBMIT COPIES OF THOSE PORTIONS OF COAL SUPPLY CONTRACTS WHICH SET FORTH THE SPECIFICATIONS OF THE FUEL AND THE DURATION OF THE CONTRACT. IF THE ACTUAL FUEL FIRED IS A BLEND OF COAL, SUBMIT APPROPRIATE PORTIONS OF ALL FUEL CONTRACTS AND STATE THE MANNER BY WHICH THE FUELS ARE BLENDED AND ACTUALLY FIRED. ATTACH AND LABEL AS EXHIBIT 240-2.

OTHER FUEL FIRING

25a) OTHER FUEL FIRING

	TYPE	SUPPLIER
a)	Blast Furnace Gas	By-Product Fuel (GCW)
b)

d) TYPICAL SULFUR CONTENT AS FIRED (WT %): a) 0.00005	e) TYPICAL ASH CONTENT AS FIRED (WT %):

f) MAXIMUM CONSUMPTION	(SPECIFY UNITS/MONTH): 30800 MMcf (all units)	(SPECIFY UNITS/YEAR): 185030 MMcf (all units)
g) TYPICAL CONSUMPTION	(SPECIFY UNITS/MONTH):	(SPECIFY UNITS/YEAR):

APPLICABLE RULES

26) PROVIDE ANY SPECIFIC EMISSION STANDARD(S) AND LIMITATION(S) SET BY RULE(S) WHICH ARE APPLICABLE TO THIS EMISSION UNIT (E.G., PARTICULATE MATTER, IAC 212.206, <= 0.10 LBS/MMBTU):

REGULATED AIR POLLUTANT(S)	EMISSION STANDARD(S)	REQUIREMENT(S)

27) PROVIDE ANY SPECIFIC RECORDKEEPING RULE(S) WHICH ARE APPLICABLE TO THIS EMISSION UNIT:

REGULATED AIR POLLUTANT(S)	RECORDKEEPING RULE(S)	REQUIREMENT(S)

28) PROVIDE ANY SPECIFIC REPORTING RULE(S) WHICH ARE APPLICABLE TO THIS EMISSION UNIT:

REGULATED AIR POLLUTANT(S)	REPORTING RULE(S)	REQUIREMENT(S)

29) PROVIDE ANY SPECIFIC MONITORING RULE(S) WHICH ARE APPLICABLE TO THIS EMISSION UNIT:

REGULATED AIR POLLUTANT(S)	MONITORING RULE(S)	REQUIREMENT(S)

30) PROVIDE ANY SPECIFIC TESTING RULES AND/OR PROCEDURES WHICH ARE APPLICABLE TO THIS EMISSION UNIT :

REGULATED AIR POLLUTANT(S)	TESTING RULE(S)	REQUIREMENT(S)

31) DOES THE EMISSION UNIT QUALIFY FOR AN EXEMPTION FROM AN OTHERWISE APPLICABLE RULE? ☐ YES ☒ NO

IF YES, THEN LIST BOTH THE RULE FROM WHICH IT IS EXEMPT AND THE RULE WHICH ALLOWS THE EXEMPTION. PROVIDE A DETAILED EXPLANATION JUSTIFYING THE EXEMPTION. INCLUDE DETAILED SUPPORTING DATA AND CALCULATIONS. ATTACH AND LABEL AS EXHIBIT 240-3, OR REFER TO OTHER ATTACHMENT(S) WHICH ADDRESS AND JUSTIFY THIS EXEMPTION.

COMPLIANCE INFORMATION

32) IS THE EMISSION UNIT IN COMPLIANCE WITH ALL APPLICABLE REQUIREMENTS? ☒ YES ☐ NO

IF NO, THEN FORM 294-CAAPP "COMPLIANCE PLAN/SCHEDULE OF COMPLIANCE – ADDENDUM FOR NON COMPLYING EMISSION UNITS" MUST BE COMPLETED AND SUBMITTED WITH THIS APPLICATION.

33) EXPLANATION OF HOW INITIAL COMPLIANCE IS TO BE, OR WAS PREVIOUSLY, DEMONSTRATED:

Stack Testing

34) EXPLANATION OF HOW ONGOING COMPLIANCE WILL BE DEMONSTRATED:

Fuel Sulfur Content Testing and Engineering Calculations

TESTING, MONITORING, RECORDKEEPING AND REPORTING

35a) LIST THE PARAMETERS THAT RELATE TO AIR EMISSIONS FOR WHICH RECORDS ARE BEING MAINTAINED TO DETERMINE FEES, RULE APPLICABILITY OR COMPLIANCE. INCLUDE THE UNIT OF MEASUREMENT, THE METHOD OF MEASUREMENT, AND THE FREQUENCY OF SUCH RECORDS (E.G., HOURLY, DAILY, WEEKLY):

PARAMETER	UNIT OF MEASUREMENT	METHOD OF MEASUREMENT	FREQUENCY
BFG flow	MMcf	flowmeter	monthly

35b) BRIEFLY DESCRIBE THE METHOD BY WHICH RECORDS WILL BE CREATED AND MAINTAINED. FOR EACH RECORDED PARAMETER INCLUDE THE METHOD OF RECORDKEEPING, TITLE OF PERSON RESPONSIBLE FOR RECORDKEEPING, AND TITLE OF PERSON TO CONTACT FOR REVIEW OF RECORDS:

PARAMETER	METHOD OF RECORDKEEPING	TITLE OF PERSON RESPONSIBLE	TITLE OF CONTACT PERSON
BFG Flow	Log		

c) IS COMPLIANCE OF THE EMISSION UNIT READILY DEMONSTRATED BY REVIEW OF THE RECORDS? ☒ YES ☐ NO

IF NO, EXPLAIN:

d) ARE ALL RECORDS READILY AVAILABLE FOR INSPECTION, COPYING AND SUBMITTAL TO THE AGENCY UPON REQUEST? ☒ YES ☐ NO

IF NO, EXPLAIN:

36a) DESCRIBE ANY MONITORS OR MONITORING ACTIVITIES USED TO DETERMINE FEES, RULE APPLICABILITY OR COMPLIANCE:

None

b) WHAT PARAMETER(S) IS(ARE) BEING MONITORED (E.G., OPACITY)?

c) DESCRIBE THE LOCATION OF EACH MONITOR (E.G., IN STACK MONITOR):

36d) IS EACH MONITOR EQUIPPED WITH A RECORDING DEVICE? ☐ YES ☐ NO

IF NO, LIST ALL MONITORS WITHOUT A RECORDING DEVICE:

e) IS EACH MONITOR REVIEWED FOR ACCURACY ON AT LEAST A QUARTERLY BASIS? ☐ YES ☐ NO

IF NO, EXPLAIN:

f) IS EACH MONITOR OPERATED AT ALL TIMES THE ASSOCIATED EMISSION UNIT IS IN OPERATION? ☐ YES ☐ NO

IF NO, EXPLAIN:

37) PROVIDE INFORMATION ON THE MOST RECENT TESTS, IF ANY, IN WHICH THE RESULTS ARE USED FOR PURPOSES OF THE DETERMINATION OF FEES, RULE APPLICABILITY OR COMPLIANCE. INCLUDE THE TEST DATE, TEST METHOD USED, TESTING COMPANY, OPERATING CONDITIONS EXISTING DURING THE TEST AND A SUMMARY OF RESULTS. IF ADDITIONAL SPACE IS NEEDED, ATTACH AND LABEL AS EXHIBIT 240-4:

TEST DATE	TEST METHOD	TESTING COMPANY	OPERATING CONDITIONS	SUMMARY OF RESULTS
None				

38) DESCRIBE ALL REPORTING REQUIREMENTS AND PROVIDE THE TITLE AND FREQUENCY OF REPORT SUBMITTALS TO THE AGENCY:

REPORTING REQUIREMENTS	TITLE OF REPORT	FREQUENCY
None

EXHAUST POINT INFORMATION

THIS SECTION SHOULD NOT BE COMPLETED IF EMISSIONS ARE EXHAUSTED THROUGH AIR POLLUTION CONTROL EQUIPMENT.

41) FLOW DIAGRAM DESIGNATION OF EXHAUST POINT:

42) DESCRIPTION OF EXHAUST POINT (STACK, VENT, ROOF MONITOR, INDOORS, ETC.). IF THE EXHAUST POINT DISCHARGES INDOORS, DO NOT COMPLETE THE REMAINING ITEMS.

43) DISTANCE TO NEAREST PLANT BOUNDARY FROM EXHAUST POINT DISCHARGE (FT):

44) DISCHARGE HEIGHT ABOVE GRADE (FT):

45) GOOD ENGINEERING PRACTICE (GEP) HEIGHT, IF KNOWN (FT):

46) DIAMETER OF EXHAUST POINT (FT): NOTE: FOR A NON CIRCULAR EXHAUST POINT, THE DIAMETER IS 1.128 TIMES THE SQUARE ROOT OF THE AREA.

47) EXIT GAS FLOW RATE	a) MAXIMUM (ACFM):	b) TYPICAL (ACFM):
48) EXIT GAS TEMPERATURE	a) MAXIMUM (°F):	b) TYPICAL (°F):

49) DIRECTION OF EXHAUST (VERTICAL, LATERAL, DOWNWARD):

50) LIST ALL EMISSION UNITS AND CONTROL DEVICES SERVED BY THIS EXHAUST POINT:

	NAME	FLOW DIAGRAM DESIGNATION

Source Designation:
Boilers 1-10

FUEL COMBUSTION EMISSION UNIT DATA AND INFORMATION

FOR AGENCY USE ONLY
ID NUMBER:
EMISSION POINT #:
DATE:

SOURCE INFORMATION

1) SOURCE NAME:
United States Steel - Granite City Works

2) DATE FORM PREPARED:

3) SOURCE ID NO. (IF KNOWN): 119813AAI

GENERAL INFORMATION

4) NAME OF EMISSION UNIT:
NG Combustion Units (Boilers, Blast Air Stoves, Ladle Dryers and BFG Flare)

5) NAME OF PROCESS:
NG Combustion

6) DESCRIPTION OF PROCESS:
NG Combustion to produce usable heat

7) DESCRIPTION OF ITEM OR MATERIAL PRODUCED OR ACTIVITY ACCOMPLISHED:
Produce steam or usable heat

8) FLOW DIAGRAM DESIGNATION OF EMISSION UNIT:
NG Combustion Units

9) MANUFACTURER OF EMISSION UNIT (IF KNOWN):

10) MODEL NUMBER (IF KNOWN):

11) SERIAL NUMBER (IF KNOWN):

12) DATES OF COMMENCING CONSTRUCTION, OPERATION AND/OR MOST RECENT MODIFICATION OF THIS EMISSION UNIT (ACTUAL OR PLANNED)

a) CONSTRUCTION (MONTH/YEAR):
~1920s

b) OPERATION (MONTH/YEAR):

c) LATEST MODIFICATION (MONTH/YEAR):

13) DESCRIPTION OF MODIFICATION (IF APPLICABLE):
Revise NG combustion emission factors for VOM and CO used to develop limits in Production Increase Permit to reflect changes in AP-42 emission factors.

THIS AGENCY IS AUTHORIZED TO REQUIRE THIS INFORMATION UNDER ILLINOIS REVISED STATUTES, 1991, AS AMENDED 1992, CHAPTER 111 1/2, PAR. 1039.5. DISCLOSURE OF THIS INFORMATION IS REQUIRED UNDER THAT SECTION. FAILURE TO DO SO MAY PREVENT THIS FORM FROM BEING PROCESSED AND COULD RESULT IN THE APPLICATION BEING DENIED. THIS FORM HAS BEEN APPROVED BY THE FORMS MANAGEMENT CENTER.

FOR APPLICANT'S USE

APPLICATION PAGE _____

14) DOES THE EMISSION UNIT HAVE MORE THAN ONE MODE OF OPERATION? ☐ YES ☒ NO

IF YES, EXPLAIN AND IDENTIFY WHICH MODE IS COVERED BY THIS FORM (NOTE: A SEPARATE PROCESS EMISSION UNIT FORM 240-CAAPP MUST BE COMPLETED FOR EACH MODE):

15) PROVIDE THE NAME AND DESIGNATION OF ALL AIR POLLUTION CONTROL EQUIPMENT CONTROLLING THIS EMISSION UNIT, IF APPLICABLE (FORM 260-CAAPP AND THE APPROPRIATE 260-CAAPP ADDENDUM FORM MUST BE COMPLETED FOR EACH ITEM OF AIR POLLUTION CONTROL EQUIPMENT):

None

16) WILL EMISSIONS DURING STARTUP EXCEED EITHER THE ALLOWABLE EMISSION RATE PURSUANT TO A SPECIFIC RULE, OR THE ALLOWABLE EMISSION LIMIT AS ESTABLISHED BY AN EXISTING OR PROPOSED PERMIT CONDITION? ☐ YES ☒ NO

IF YES, COMPLETE AND ATTACH FORM 203-CAAPP, "REQUEST TO OPERATE WITH EXCESS EMISSIONS DURING STARTUP OF EQUIPMENT".

17) PROVIDE ANY LIMITATIONS ON SOURCE OPERATION AFFECTING EMISSIONS OR ANY WORK PRACTICE STANDARDS (E.G., ONLY ONE UNIT IS OPERATED AT A TIME):

BFG Combustion facility wide limited to 185,030 million cubic feet per year.
NG combustion in the boilers, BF Stoves, Ladle Dryers and BFG flare limited to 1,346 million cubic feet per year.

OPERATING INFORMATION

18) ATTACH THE CALCULATIONS, TO THE EXTENT THEY ARE AIR EMISSION RELATED, FROM WHICH THE FOLLOWING OPERATING INFORMATION, MATERIAL USAGE INFORMATION AND FUEL USAGE DATA WERE BASED AND LABEL AS EXHIBIT 240-1. REFER TO SPECIAL NOTES OF FORM 202-CAAPP.

19a) MAXIMUM OPERATING HOURS	HOURS/DAY: 24	DAYS/WEEK: 7	WEEKS/YEAR: 52
b) TYPICAL OPERATING HOURS	HOURS/DAY: 24	DAYS/WEEK: 7	WEEKS/YEAR: 52

20) ANNUAL THROUGHPUT	DEC-FEB(%):	MAR-MAY(%):	JUN-AUG(%):	SEP-NOV(%):

FIRING RATE INFORMATION

21a) RATED OR DESIGN HEAT INPUT CAPACITY (MILLION BTU/HR): 60 each

b) IS MORE THAN ONE FUEL FIRED AT A TIME? ☒ YES ☐ NO

IF YES, EXPLAIN:

Units can fire NG or BFG. During BFG firing, NG or COG is required for pilot flame to maintain combustion.

21c) IF HEAT INPUT CAPACITY IS 100 MILLION BTU/HOUR OR GREATER, PROVIDE FURNACE VOLUME (CUBIC FEET)
NOTE: FURNACE VOLUME IS DEFINED AS THAT VOLUME BOUNDED BY THE FRONT FURNACE WALL WHERE THE BURNER IS LOCATED, THE FURNACE SIDE WATERWALL, AND EXTENDING TO THE LEVEL JUST BELOW OR IN FRONT OF THE FIRST ROW OF CONVECTION PASS TUBES.

	NATURAL GAS	FUEL OIL	COAL	OTHER
d) SINGLE FUEL (MAXIMUM - MILLION BTU/HOUR)				
e) SINGLE FUEL (TYPICAL - MILLION BTU/HOUR)				
f) COMBINED FUEL (TYPICAL - MILLION BTU/HOUR) (IF APPLICABLE)				

NATURAL GAS FIRING

22a) CURRENT ORIGIN OF NATURAL GAS:
☒ PIPELINE (FIRM CONTRACT) ☐ BY-PRODUCT, SPECIFY ORIGIN:
☐ PIPELINE (INTERRUPTIBLE SUPPLY CONTRACT) ☐ OTHER, - SPECIFY:

b) TYPICAL HEAT CONTENT (BTU/SCF):

g) TYPICAL CONSUMPTION	(SPECIFY UNITS/MONTH):	(SPECIFY UNITS/YEAR):

APPLICABLE RULES

26) PROVIDE ANY SPECIFIC EMISSION STANDARD(S) AND LIMITATION(S) SET BY RULE(S) WHICH ARE APPLICABLE TO THIS EMISSION UNIT (E.G., PARTICULATE MATTER, IAC 212.206, <= 0.10 LBS/MMBTU):

REGULATED AIR POLLUTANT(S)	EMISSION STANDARD(S)	REQUIREMENT(S)

27) PROVIDE ANY SPECIFIC RECORDKEEPING RULE(S) WHICH ARE APPLICABLE TO THIS EMISSION UNIT:

REGULATED AIR POLLUTANT(S)	RECORDKEEPING RULE(S)	REQUIREMENT(S)

28) PROVIDE ANY SPECIFIC REPORTING RULE(S) WHICH ARE APPLICABLE TO THIS EMISSION UNIT:

REGULATED AIR POLLUTANT(S)	REPORTING RULE(S)	REQUIREMENT(S)

29) PROVIDE ANY SPECIFIC MONITORING RULE(S) WHICH ARE APPLICABLE TO THIS EMISSION UNIT:

REGULATED AIR POLLUTANT(S)	MONITORING RULE(S)	REQUIREMENT(S)

30) PROVIDE ANY SPECIFIC TESTING RULES AND/OR PROCEDURES WHICH ARE APPLICABLE TO THIS EMISSION UNIT :

REGULATED AIR POLLUTANT(S)	TESTING RULE(S)	REQUIREMENT(S)

31) DOES THE EMISSION UNIT QUALIFY FOR AN EXEMPTION FROM AN OTHERWISE APPLICABLE RULE? ☐ YES ☒ NO

IF YES, THEN LIST BOTH THE RULE FROM WHICH IT IS EXEMPT AND THE RULE WHICH ALLOWS THE EXEMPTION. PROVIDE A DETAILED EXPLANATION JUSTIFYING THE EXEMPTION. INCLUDE DETAILED SUPPORTING DATA AND CALCULATIONS. ATTACH AND LABEL AS EXHIBIT 240-3, OR REFER TO OTHER ATTACHMENT(S) WHICH ADDRESS AND JUSTIFY THIS EXEMPTION.

COMPLIANCE INFORMATION

32) IS THE EMISSION UNIT IN COMPLIANCE WITH ALL APPLICABLE REQUIREMENTS? ☒ YES ☐ NO

IF NO, THEN FORM 294-CAAPP "COMPLIANCE PLAN/SCHEDULE OF COMPLIANCE – ADDENDUM FOR NON COMPLYING EMISSION UNITS" MUST BE COMPLETED AND SUBMITTED WITH THIS APPLICATION.

33) EXPLANATION OF HOW INITIAL COMPLIANCE IS TO BE, OR WAS PREVIOUSLY, DEMONSTRATED:

Engineering Calculations

34) EXPLANATION OF HOW ONGOING COMPLIANCE WILL BE DEMONSTRATED:

TESTING, MONITORING, RECORDKEEPING AND REPORTING

35a) LIST THE PARAMETERS THAT RELATE TO AIR EMISSIONS FOR WHICH RECORDS ARE BEING MAINTAINED TO DETERMINE FEES, RULE APPLICABILITY OR COMPLIANCE. INCLUDE THE UNIT OF MEASUREMENT, THE METHOD OF MEASUREMENT, AND THE FREQUENCY OF SUCH RECORDS (E.G., HOURLY, DAILY, WEEKLY):

PARAMETER	UNIT OF MEASUREMENT	METHOD OF MEASUREMENT	FREQUENCY
NG flow	MMcf	flowmeter	monthly

35b) BRIEFLY DESCRIBE THE METHOD BY WHICH RECORDS WILL BE CREATED AND MAINTAINED. FOR EACH RECORDED PARAMETER INCLUDE THE METHOD OF RECORDKEEPING, TITLE OF PERSON RESPONSIBLE FOR RECORDKEEPING, AND TITLE OF PERSON TO CONTACT FOR REVIEW OF RECORDS:

PARAMETER	METHOD OF RECORDKEEPING	TITLE OF PERSON RESPONSIBLE	TITLE OF CONTACT PERSON
NG Flow	Log		

c) IS COMPLIANCE OF THE EMISSION UNIT READILY DEMONSTRATED BY REVIEW OF THE RECORDS? ☒ YES ☐ NO

IF NO, EXPLAIN:

d) ARE ALL RECORDS READILY AVAILABLE FOR INSPECTION, COPYING AND SUBMITTAL TO THE AGENCY UPON REQUEST? ☒ YES ☐ NO

IF NO, EXPLAIN:

36a) DESCRIBE ANY MONITORS OR MONITORING ACTIVITIES USED TO DETERMINE FEES, RULE APPLICABILITY OR COMPLIANCE:

None

b) WHAT PARAMETER(S) IS(ARE) BEING MONITORED (E.G., OPACITY)?

c) DESCRIBE THE LOCATION OF EACH MONITOR (E.G., IN STACK MONITOR):

36d) IS EACH MONITOR EQUIPPED WITH A RECORDING DEVICE? ☐ YES ☐ NO

IF NO, LIST ALL MONITORS WITHOUT A RECORDING DEVICE:

e) IS EACH MONITOR REVIEWED FOR ACCURACY ON AT LEAST A QUARTERLY BASIS? ☐ YES ☐ NO

IF NO, EXPLAIN:

f) IS EACH MONITOR OPERATED AT ALL TIMES THE ASSOCIATED EMISSION UNIT IS IN OPERATION? ☐ YES ☐ NO

IF NO, EXPLAIN:

37) PROVIDE INFORMATION ON THE MOST RECENT TESTS, IF ANY, IN WHICH THE RESULTS ARE USED FOR PURPOSES OF THE DETERMINATION OF FEES, RULE APPLICABILITY OR COMPLIANCE. INCLUDE THE TEST DATE, TEST METHOD USED, TESTING COMPANY, OPERATING CONDITIONS EXISTING DURING THE TEST AND A SUMMARY OF RESULTS. IF ADDITIONAL SPACE IS NEEDED, ATTACH AND LABEL AS EXHIBIT 240-4:

TEST DATE	TEST METHOD	TESTING COMPANY	OPERATING CONDITIONS	SUMMARY OF RESULTS

38) DESCRIBE ALL REPORTING REQUIREMENTS AND PROVIDE THE TITLE AND FREQUENCY OF REPORT SUBMITTALS TO THE AGENCY:

REPORTING REQUIREMENTS	TITLE OF REPORT	FREQUENCY

APPENDIX B

Existing Permits

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

217/782-2113

REVISED
OPERATING PERMIT

PERMITTEE

U.S. Steel Granite City
Attn: Larry Siebenberger
Route 203 and 20th Street
Granite City, Illinois 62040

Application No.: 95010001 I.D. No.: 119813AAI
Applicant's Designation: Date Received: April 29, 2002
Subject: Production Increase, Renewal
Date Issued: June 25, 2002 Expiration Date: June 25, 2007
Location: Southeastern Granite City

Permit is hereby granted to the above-designated Permittee for an increase in the allowable production rate of iron (from 2,372,500 to 3,165,000 net tons per year) and steel (from 2,774,000 to 3,580,000 net tons per year) as described in the above-referenced application. This permit is subject to standard conditions attached hereto and the following special conditions:

1. Prior to issuance of this permit, a draft of this permit has undergone a public notice and comment period, and a public hearing was held.

BLAST FURNACE OPERATIONS

2a. Total combined production of hot metal (a.k.a., iron) from blast furnaces A and B shall not exceed 9,849 net tons per day, averaged over any calendar month, and;

b. Total combined production of hot metal from blast furnaces A and B shall not exceed 3,165,000 net tons per year.

3a. Particulate emissions from the blast furnace casthouse baghouse and iron spout baghouse shall not exceed 0.010 gr/dscf, pursuant to 35 Ill. Adm. Code 212.445(b)(1).

b. The opacity of emissions from the blast furnace casthouse baghouse and the iron spout baghouse shall not exceed 10% on a 6 minute rolling average basis, pursuant to 35 Ill. Adm. Code 212.445(b)(1).

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4a. Emissions of particulate matter from any opening in the blast furnace casthouse shall not exceed 20% opacity on a 6-minute rolling average basis beginning from initiation of the opening of the tap hole up to the point where iron and slag stops flowing in the troughs, pursuant to 35 Ill. Adm. Code 212.445(a)(2).

5. Emissions from Blast Furnace operations shall not exceed the limits in attached Tables 1 and 5.

BASIC OXYGEN FURNACE SHOP

6a. Total combined production of liquid steel from the Basic Oxygen Furnaces (BOFs) shall not exceed 11,000 net tons per day, averaged over any calendar month, and;

b. Total combined production of liquid steel from the BOFs shall not exceed 3,580,000 net tons per year.

7. The emissions of PM-10 from the BOF ESP stack for the total of all BOF processes (i.e., operations from the beginning of the charging process through the end of the tapping process) shall not exceed 60.0 lbs/hr and 0.225 lbs per ton of steel in process, pursuant to 35 Ill. Adm. Code 212.458(b)(23).

8. Visible emissions from any opening in the BOF shop (e.g., roof monitor) shall not exceed 20% on a 3 minute rolling average basis.

9a. The Permittee shall determine the opacity from the openings BOF shop on at least a weekly basis. Observations shall be conducted for at least an hour or the entire BOF cycle, whichever is greater.

b. The Permittee shall determine the opacity from the BOF ESP stack for at least one hour on any normal work day (i.e., Monday through Friday) that the continuous opacity monitor on the BOF ESP stack has an outage that exceeds two consecutive hours and is still down. The readings shall commence as soon as possible after the opacity monitor has been down for two consecutive hours. If meteorological conditions or lack of visibility preclude these observations from being conducted, then this shall be noted in the log book.

c. The opacity shall be determined in accordance with the observation procedures set out in 40 CFR Part 60, Appendix

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

A, Method 9 including the requirement that readings be taken by a certified observer.

d. These determinations shall be recorded in a log book, which at a minimum shall include the date and time of observations, name and title of observer, individual opacity readings, calculated opacity so as to determine compliance with Section 212.123, and calculated opacity relative to 20% opacity on a three minute rolling average basis.

10. The Permittee shall follow the BOF operating procedures and requirements specified in attachment A. These requirements are designed to ensure proper operation of the BOF control system. These procedures shall be posted in the BOF pulpit (a.k.a., control room).

11. Flame suppression shall be used and maintained during the entire tapping process.

12a. The stack gas pulpit set point of the BOF ESP control system shall be set in accordance with the following, so as to establish sufficient particulate matter capture efficiency of the charging and primary hoods:

i. Set point requirements while only a single BOF vessel is in operation;

A. Minimum set point during charging process: 550,000 cfm;

B. Minimum set point during refining process: 650,000 cfm;

C. Minimum set point during tapping process: 200,000 cfm (until one minute after completing alloy addition);

b. i. During dual operation of BOF vessels (a.k.a., overlapping BOF operation) the minimum set point shall be 700,000 cfm.

iii. Overlapping operations of the BOF vessels is allowed under the following conditions:

A. The hot metal charge of the second vessel shall be initiated and completed during the time between completion of the blow and start of tap on the first vessel while sufficient

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

draft at the ESP capture system is established and maintained for both vessels.

B. The charge and/or blow on one vessel shall not begin until sufficient draft has been established at the associated ESP capture system (a.k.a., doghouse) and the alloy addition at the vessel tapping has been completed for a least 1 minute.

C. Sufficient draft at the ESP capture system of the vessel being tapped shall be maintained for at least 1 minute after alloy addition has been completed. After such period, the capture system draft may be transferred over to the other vessel in order to satisfy condition (A) above.

D. Only overlapping of the hot metal charge of the second vessel after the end of blow and prior to onset of tap of the first vessel and overlapping of tapping of the first vessel, after alloy addition, and the hot metal charge and/or blow on the second vessel are allowed.

E. Condition B and C above shall be part of the Standard Operating Procedure (SOP) of the BOF vessels.

c. The BOF capture system shall be operated at the above minimum set points until and unless the Agency approves a lower minimum set point based on a demonstration that a better level of particulate matter control will occur, except for purposes of emissions testing as related to the set point.

d. The Permittee shall calibrate, operate, and maintain a continuous strip chart recorder of the ESP stack gas flow rate as measured by the stack gas flow meter during ESP use.

e. The Permittee shall record for each steel production cycle the various stack gas flow rates for each process (i.e., for each charge, each refine, each tap) of each steel production cycle. That is, the Permittee shall be able to distinguish the measured flow rate of stack gas during each production cycle.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

f. The stack gas flow meter shall be calibrated on at least a quarterly basis.

13a. The Permittee shall operate and maintain the waste gas suction monitor system that continually measures and records for each process (i.e., for each charge, each refine, each tap) of each steel production cycle the static pressure in the main downcommer duct of the ESP emissions capture and transport system.

b. The waste gas suction monitoring system shall be used as a mechanism to ensure sufficient draft is maintained in the emissions capture hoods and transport ducts so as to maximize emissions capture and transport and minimize uncaptured emissions and emission leaks.

c. The monitoring system shall be operated and maintained to ensure accurate and useful data.

d. The Permittee shall continuously record the static pressure in the main downcommer duct of the ESP emissions capture and transport system.

14a. The Permittee shall visually inspect at least monthly all visible BOF vessel enclosures, hooding and ducts used to capture and transport emissions for the BOF ESP control system.

b. A log shall maintained of these inspections which includes observations of the physical appearance of the capture system and any noted deficiencies (e.g., the presence of any holes in ductwork or hoods, flow constrictions caused by dents or accumulated dust in ductwork, and fan erosion).

c. Any leaks or areas otherwise noted to be in need of repair, shall be repaired as soon as practicable.

15a. The Permittee shall operate, maintain, and repair the BOF ESP in a manner that assures compliance with the conditions of this permit.

b. An adequate inventory of spare parts for the BOF ESP shall be maintained.

16. Written operating procedures for the BOF ESP shall be maintained and updated describing proper normal process and equipment operating parameters, monitoring and instrumentation for measuring control equipment operating

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

parameters, control equipment inspection and maintenance practices, and the availability of spare parts from inventory, local suppliers and other sources.

17. The Permittee shall keep operating records, a maintenance log, and inspection log for the BOF ESP and associated control systems which includes the following:

a. Operating time of the BOF;

b. Operating time of the capture systems and performance parameters, including air flow and fan amperage through the fan motors, gas temperature at inlet to ESP, damper settings, and steam injection rate;

c. Operating time of the ESP and performance parameters, including voltage and amperage of each transformer/rectifier set, number of sections in use;

d. All routine and nonroutine maintenance performed, including dates and duration of outages, inspection schedule and findings, leaks detected, repair actions, and replacements.

18. Emissions from the BOF Shop shall not exceed the limits in attached Tables 2 and 5.

Note: For purposes of this permit, a BOF cycle is defined as the period from the beginning of the charging process through the end of the tapping process. The cycle is comprised of three main processes which are charging, refining, and tapping.

CONTINUOUS CASTING OPERATIONS

19. The continuous casting operations shall comply with 35 Ill. Adm. Code 212.450 and 212.458(b)(8).

20. Emissions from the continuous casting operations shall not exceed the limits in Tables 3 and 5.

FUEL COMBUSTION

21. Total fuel usage for blast furnace stoves (A and B), boiler house boilers (1-10), blast furnace boilers (11 and 12), ladle drying preheaters and blast furnace gas flares shall not exceed the following limits:

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

a. Natural Gas usage: 225 million ft^3 per month and 1,346 million ft^3 per year;

b. Blast Furnace Gas (BFG) usage: 30,800 million ft^3 per month and 185,030 million ft^3 per year;

c. Fuel Oil usage: 60 thousand gallons per month and 365 thousand gallons per year.

22. Emissions from the fuel combustion units listed above shall not exceed the limits in Tables 4 and 5.

ON-SITE FUGITIVE DUST CONTROL

(Refer to Attachment B for a table which summarizes the required on-site fugitive dust roadway control measures and maps indicating the referred to road segments)

23. The Permittee shall immediately initiate and maintain the on-site fugitive dust control measures specified in this permit so as eliminate dust spillage on in-plant and out-of-plant roadways.

24a. The Permittee shall sweep or flush at least every day the paved access area below the BOF ESP where ESP dust collection bags are used, stored and transported.

b. The Permittee shall implement a housekeeping program for the non-roadway areas below and around the BOF ESP. This program shall, at a minimum, contain the following:

i. The ground and other accessible areas where dust may gather shall be swept or cleaned at least every day;

ii. Cleaning shall be performed in such a manner as to minimize the escape of dust into the atmosphere;

iii. Dust collection bags shall be inspected at least daily for rips, tears, or insecure connection to the discharge chutes of the ESP hoppers;

iv. Dust collection bags shall be inspected after removal from, and connection to, the discharge chutes of the ESP hoppers;

v. Ripped or torn bags shall be taken out of service and transported as soon as practicable in a covered truck.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

25. Fugitive emissions of particulate matter from any roadway or parking area shall not exceed an opacity of 5%, pursuant to 35 Ill. Adm. code 212.316(e)(1).

26a. UNPAVED ROADS: On unpaved roads that are part of normal traffic patterns as identified in attachment B (including roads B, C, E, N, F-F, and CS(2)) the Permittee shall apply a chemical dust suppressant at least three times a month, with the following exceptions:

i. Road segment G-G, which shall be sprayed at least quarterly;

ii. Road segments P, V, Z, D-D, E-E, and H, which shall be sprayed at least 4 times per month until paving is completed. Paving shall be completed on these roads no later than July 31, 1996;

iii. Road segment L, which shall be sprayed at least 4 times per month.

b. All other unpaved roads shall be treated as necessary.

c. Applications of suppressant may be less frequent than specified above if weather conditions, i.e., precipitation or temperature, interfere with the schedule for spraying, provided each such instance shall be recorded in accordance with the daily records for on-site fugitive dust control required by this permit.

27a. PAVED ROADWAYS AND AREAS: Paved roadways and areas shall be maintained in good condition.

b. On paved roadways and other areas, the Permittee shall sweep or flush as follows:

i. Road segments D, K, M, F, G, J, R, and O shall be swept or flushed at least daily;

ii. Road segments P, V, W, X, Z, D-D, E-E, and CS(1) shall be swept or flushed at least five days per week;

iii. Road segments S and T shall be swept or flushed at least every other day;

iv. Road segments A and H shall be swept or flushed at least once per month;

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

v. All gate areas leading from the Steelworks area shall be swept or flushed at least daily;

vi. All gate areas leading from the iron making area shall be swept or flushed at least five times per week.

28. The above on-site dust control measures shall be conducted to maximize their effectiveness by performing said measures when the roads or areas are not normally obstructed by parked vehicles and by preferentially using filter sweeping (e.g., Enviro-Whirl sweeper) for the gate areas, the roads and areas surrounding the BOF and BOF ESP, and other key areas.

29. The Permittee shall maintain daily records relative to the on-site fugitive dust control program which includes the following information as a minimum:

a. The date (and time for the gate areas) each road or area was treated;

b. The manner in which the road or area was treated (i.e., filter sweep, conventional sweep, suppressant spray or flush);

c. Detailed information for use of dust suppressant, including but not limited to the application rate, dilution ratio, type of suppressant used, and the number of gallons of suppressant applied;

d. Observations, if any, concerning the condition of the roadway, e.g., presence of parked vehicles, detection of potholes;

e. The amount of precipitation and temperature recorded for each day, and if determination was made to suspend application of suppressant, include name and title of person who made determination to suspend application and explanation;

f. Any and all suspensions or deviations from the designated control procedures, with date, description, and explanation for suspension of application.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

OFF-SITE FUGITIVE DUST CONTROL

30. The Permittee or the Permittee's Agent shall sweep or flush the following Granite City street road areas:

a. At least weekly, the quarter mile segment of Madison Avenue in front of the 16th street gate (i.e., 1/8 of a mile in either direction);

b. At least weekly, segment of 20th street between Lee and Quincy roads;

c. At least monthly, segment of 20th street between Madison and Route 203 (a.k.a. Edwardsville Road).

PM-10 CONTINGENCY MEASURES

31. The Permittee shall comply with the additional control measures (e.g., PM-10 contingency plan) required by 35 Ill Adm. Code Part 212 Subpart U.

COMPLIANCE DETERMINATIONS

32a. Compliance with the daily limits of this permit shall be determined from a monthly total of the relevant daily data divided by the number of days in the month.

b. Compliance with the monthly limits of this permit (e.g., fuel usage) shall be determined by direct comparison of monthly data to the applicable limit.

c. i. Compliance with the annual limits of this permit shall be determined based on a calendar year.

ii. A. Compliance with the production limits in conditions 2(b) and 6(b) shall also be determined on a month by month basis by showing that the actual production of iron and steel from the plant did not exceed the scheduled rate of production for a month given in the most recent production schedule provided to the Agency that shows compliance with the following requirements.

B. If no production schedule is submitted to the Agency by the Permittee for a particular year, the scheduled monthly production of iron and steel shall be set at one twelfth of the

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

annual production limits in conditions 2(b) and 6(b).

C. 1. The Permittee may submit a schedule for iron and steel production for each month of the calendar year. Such schedule shall provide the scheduled monthly iron and steel production for each month and the total of such scheduled production shall not exceed the annual production limits in conditions 2(b) and 6(b). This schedule shall be submitted each year no later than December 15th of the preceding year.

2. During the course of the year, the Permittee may submit a revised production schedule which accounts for actual production levels which were below that scheduled for the previous months, provided that in no case shall the scheduled production for prior months in such a revised schedule be lowered to less than actual production levels or raised. Such revised schedule shall be submitted to the Agency no later than 15 days after the first day of the month for which scheduled production has been raised. Such schedule shall be accompanied by data on actual production in preceding months.

33a. Compliance with opacity limits and measurements of opacity shall be made by opacity readings taken in accordance with the observation procedures set out in 40 CFR Part 60, Appendix A, Method 9.

b. The Permittee shall have at least two employees or agents experienced in making opacity readings to the extent that it is reasonably possible to do so, who shall be able to make the opacity readings required by this permit.

34a. Blast furnace hot metal production shall be measured at the BOF hot metal transfer station, and adjusted by documented slag and iron losses.

b. BOF liquid steel production shall be initially measured by a scale equipped crane and adjusted based upon documented steel production analysis of the continuous casters.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

c. BFG usage shall be calculated based on the total BFG produced per net ton hot metal (NTHM) derived by the following formula and adjusted per analysis of documented BFG consumptions:

$$\text{mmft}^3 \text{ BFG per month} = \frac{(4.585277 \text{ NTHM/day} + 498.191)}{80} \times \begin{pmatrix}\text{Number of} \\ \text{days in} \\ \text{that month}\end{pmatrix}$$

d. Natural gas usage shall be determined by metered volumes.

e. Fuel oil usage shall be determined by tank height differentials.

RECORD KEEPING

35. The Permittee shall keep records of the following items and such other items which may be appropriate to allow the Agency to review compliance:

a. Blast Furnace hot metal production (total combined daily, monthly and annual in tons), including documentation on iron and slag losses;

b. BOF liquid steel production (total combined daily, monthly and annual in tons), including documentation on adjustments made due to production analysis and losses;

c. Fuel usage as follows; Usage of natural gas and BFG (total combined million ft^3 per month and year, each) and fuel oil (total combined gallons/month and year) for the blast furnace stoves (A and B), boiler house boilers (1-10), blast furnace boilers (11 and 12), ladle drying preheaters and blast furnace gas flares.

36. All records and logs required by this permit shall be retained at a readily accessible location at the source for at least three years from the date of entry and shall be made available for inspection and copying by the Agency and USEPA upon request. Any records retained in a computer shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Agency request for records during the course of a source inspection.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

TESTING

37. The special conditions of this permit supplement the special conditions of any existing operating permits for this source, and supersede such conditions in cases where a conflict exists.

38a. The following tests shall be performed by no later than August 6, 1997 to demonstrate compliance with the conditions of this permit.

i. Fuel Combustion Units testing: The emissions of particulate matter from boiler #12 while burning blast furnace gas shall be measured. This test shall be designed to verify compliance with the requirements of this permit and the emission factor used (i.e., 2.9 lbs particulate emitted per mmcf BFG burned);

b. The test shall be performed by an approved independent testing service during conditions which are representative of maximum emissions and at the maximum production rates allowed, or as close to such rates as reasonable if the Permittee demonstrates to the Agency prior to testing that testing at such production rates within the time constraints of an Agency request to test is not practicable.

c. i. The following methods and procedures shall be used for the testing, unless another method is approved by the Agency: Refer to 40 CFR 60, Appendix A for USEPA test methods;

Location of sample points	USEPA Method 1
Gas flow and velocity	USEPA Method 2
Particulate Matter	USEPA Method 5

ii. All particulate measured shall be considered PM-10 unless emissions are tested by an appropriate USEPA test method for measurement of PM-10, as specified in 35 Ill. Adm. Code 212.110(e).

d. At least 30 days prior to the actual date of testing, a written test plan shall be submitted to the Agency for review and approval. This plan shall be describe the specific procedures for testing, including as a minimum:

i. The persons who will be performing sampling and analysis and their experience with similar tests;

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

ii. The specific conditions under which testing will be performed including a discussion of why these conditions will be representative of maximum emissions and the means by which operating parameters for the source and the emissions capture and control system will be determined;

iii. The specific determinations of emissions and operation which are intended to be made, including sampling and monitoring locations;

iv. The test methods which will be used, with the specific analysis methods;

v. Any proposed use of an alternative test method, with detailed justification;

vii. The format and content of the Source Test Report.

e. The Agency shall be notified before these tests to enable the Agency to observe these tests. Notification for the expected date of testing shall be submitted a minimum of thirty (30) days prior to the expected date. Notification of the actual and expected time of testing shall be submitted a minimum of five (5) working days prior to the actual date of the test. The Agency may at its discretion accept notifications with shorter advance notice provided that the Agency will not accept such notifications if it interferes with the Agency's ability to observe testing.

f. The Final Report of these tests shall include as a minimum:

i. A tabular summary of results which includes:

- Process weight rate and/or fuel usage rate
- Production rate
- Allowable emission limit
- Measured emission rate
- Determined emission factor
- Compliance demonstrated - Yes/No
- Any other pertinent information

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

ii. Description of test methods and procedures used, including description of sampling train, analysis equipment, and test schedule;

iii. Detailed description of test conditions, including,

- Pertinent process information (e.g. fuel or raw material consumption)

- Control equipment information, i.e. equipment condition and operating parameters during testing;

iv. Data and calculations, including copies of all raw data sheets and records of laboratory analyses, sample calculations, and data on equipment calibration;

g. Copies of the Final Report for these tests shall be submitted to the Agency within 14 days after the test results are compiled and finalized.

h. Submittals of information shall be made as follows:

i. Notice of Test - one copy to Source Emission Test Specialist, one copy to Regional Office, and one copy to Permit Section;

ii. Final Report - one copy to Source Emission Test Specialist, one copy to Regional Office, and one copy to Permit Section.

Pertinent Addresses are:

REPORTING

39. If there is an exceedance of the requirements of this permit as determined by the records required by this permit, the Permittee shall submit a report to the Agency's Compliance Unit in Springfield, Illinois within 30 days after the exceedance. The report shall include the emissions released in accordance with the record keeping requirements, a copy of the relevant records, and a description of the exceedance or violation, cause of the exceedance, and efforts to reduce emissions and future occurrences. This report shall be sent to:

Illinois EPA
Bureau of Air
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

40. The Permittee shall submit the following additional information from the prior calendar year with the Annual Emissions Report, due May 1st of each year:

a. Iron and steel production (tons/month and tons/yr, each);

b. Natural gas and BFG usage ($mmft^3$/month and $mmft^3$/yr, each);

c. Fuel oil usage (thousand gallons/month and thousand gallons/yr, for each type of oil).

APPLICABILITY OF MAJOR SOURCE RULES

41a. As a consequence of the above conditions, this permit is issued based upon the following changes in emissions, as further described in Table 6, accompanying increased production as allowed by this permit:

i. The increases in emissions of lead and VOM are not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration;

ii. The increase in emissions of NO_x are being accompanied by contemporaneous emission decreases provided by the shutdown of equipment and operations such that the net emissions change is not significant under 35 Ill.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration.

iii. The increase in emissions of PM and PM-10 are being accompanied by contemporaneous emission decreases provided by additional road dust control and BOF capture and control such that the net emissions change is not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration.

Also, the Permittee has agreed to provide further additional dust control consisting of the sweeping of Granite City public streets and housekeeping measures in the area below and surrounding the BOF ESP. Attachment C is a listing of the emission reductions provided by these control measures.

b. The increases in emissions of SO_2 and CO are significant under 40 CFR 52.21 - Prevention of Significant Deterioration (PSD). Accordingly, the project is considered a major modification and must comply with the requirements of PSD. These requirements include a demonstration of best available control requirements for affected SO_2 and CO emission units, an analysis of air quality impacts, an analysis of the impacts of the project on visibility, vegetation's and soils, and the application and proposed permit must undergo a public participation. The Agency has determined that these additional requirements have been met.

c. The changes in emissions pertinent to this project are summarized as follows:

Units = tons/year

- Emission increases which could occur from the project:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
51.6	- 52.0	238.8	476.0	5,685	59.3	0.54

- Creditable contemporaneous actual emission decreases:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
58.0	58.0	226.5	0.38	23.31	32.8	0.0

- Other contemporaneous emission increases:

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
20.7	20.3	26.0	0.25	11.8	1.6	0.0

- Net emission changes:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
+14.3	-89.2	+38.3	+475.9	+5,673	+28.1	+0.54

- Significant Levels:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
15	25	40	40	100	40	0.6

d. This revised operating permit issued January 5, 1999 is issued such that the net increase in emissions of PM, PM_{10}, SO_2, NO_x and VOM resulting from increased natural gas combustion are not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of significant Deterioration. The accounting of the increases in emissions are shown in Tables 7, 8 and 9 of the attachments.

e. The changes in emissions pertinent to the revised operating permit issued January 5, 1999 are summarized as follows:

- Emission increase from increased natural gas combustion:

PM-10	PM	NO_x	SO_2	CO	VOM
3.43	3.43	205.94	0.40	26.92	1.88

- Natural gas combustion baseline emissions (average of 1996 and 1997 actuals):

PM-10	PM	NO_x	SO_2	CO	VOM
2.9	2.9	174.11	0.34	22.76	1.59

- Net emission changes:

PM-10	PM	NO_x	SO_2	CO	VOM

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

0.53	0.53	31.83	0.06	4.16	0.29

- Significant levels:

PM-10	PM	NO_x	SO_2	CO	VOM
15	25	40	40	100	40

Explanatory Note:

PM	=	Particulate matter = particulate;
PM-10	=	Particulate matter less than or equal to 10 micrometers in size;
SO_2	=	Sulfur dioxide;
NO_x	=	Nitrogen oxides;
VOM	=	Volatile organic material;
CO	=	Carbon monoxide;
mm	=	Million;
gr/dscf	=	Grains per dry standard cubic foot;
acfm	=	Actual cubic feet per minute;
mmcf	=	Million cubic feet;
Mgal	=	Thousands of gallons.

If you have any questions on this permit, please call Kevin Smith at 217/782-2113.

TABLE 1

BLAST FURNACE OPERATIONS

Maximum Hot Metal Production = 3,165,000 net tons per year

1. Casthouse Baghouse (furnace tapping)- captured emissions ducted to baghouse, uncaptured emissions emitted through roof, other openings, etc.

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.0703	111.19
PM-10	0.0703	111.19
SO_2	0.2006	422.0
NO_x	0.0144	22.79
VOM	0.0946	149.68

2. Blast Furnace - Uncaptured fugitives

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.031	49.06
PM-10	0.0155	24.53
SO_2	0.0104	21.94
NO_x	0.0007	1.14
VOM	0.0047	7.42

3. Blast Furnace Charging
Maximum pellets charged = 4,308,581 tons/yr

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.0024	5.17
PM-10	0.0024	5.17

4. Slag Pits

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.00417	6.60
PM-10	0.00417	6.60
SO_2	0.0100	15.83

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5. Iron Spout Baghouse- captured emissions controlled by iron spout baghouse.

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.02548	40.32
PM-10	0.02548	40.32
SO_2	0.0073	13.89

6. Iron Pellet Screen
Maximum pellets charged = 4,308,581 tons/yr

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.00279	6.01
PM-10	0.00279	6.01

2. TABLE 2

BOF SHOP

Maximum Liquid Steel Production = 3,580,000 net tons per year

1. BOF ESP Stack (charge, refine, tap)

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.16	262.80
PM-10	0.16	262.80
NO_x	0.0389	69.63
VOM	0.0060	10.74
CO	8.993	16,097.47

ATTACHMENT A

PROCEDURES TO ENSURE PROPER OPERATION
OF BOF ESP CONTROL SYSTEM

1. The emissions control operator shall:

   a. Check on a regular basis and report to the emissions control foreman or melter:

      i. Any ESP fields down;

      ii. Any ESP fields in which the meter readings are showing no current or a fault;

   b. Check on a regular basis that doors on all hopper screws are closed;

   c. Inspect on a regular basis the fans and motors for unusual sounds and/or visual problems. Any abnormalities will be immediately reported to the melter or maintenance foreman for investigation.

2. The melter shall:

   a. Check on a regular basis and report to the emissions control foreman or the area electrician any fields which the pulpit precipitator field short indicators shows as having a short and is able to reset;

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

b. Check on a regular basis and report to the emissions control foreman or the maintenance foreman any draft or fan problems;

c. Check the ESP stack opacity monitor on a regular basis and initiate the following in the event that the stack opacity level, as determined by the opacity monitor, exceeds 30% opacity on a six minute average:

i. Check the pulpit indicators for proper operation of the steam and spray water system. Report any problems to emission control foreman or maintenance foreman;

ii. Check the stack gas pulpit set point for proper setting;

iii. Call the emissions control operator who shall perform the following steps;

A. Check the AVC operation and power level. Report any problems to electrical maintenance foreman or area electrician;

B. Check to ensure that doors on all hopper screws are closed;

d. Check oxygen blow rates and adjust, if necessary;

e. Check hot metal chemistry;

f. A log shall be maintained of the above checks and any actions taken as a result.

3. The emission control foreman shall:

a. Check on a regular basis the opacity monitor exceedances and trends. The control specialist shall be contacted to correct any problems;

b. Check on a regular basis the draft rate set points;

c. Check on a regular basis primary and secondary damper settings;

d. Check on a regular basis ESP operation, including the following:

i. Fields down;

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

ii. Fields indicating shorts and unable to reset;

iii. Hopper screw doors are closed;

e. Check on a regular basis blow rates;

f. Check on a regular basis spray water system operation;

g. Check on a regular basis steam injection rate;

h. Contact the area manager regarding electrical maintenance and to schedule the ESP repair work;

i. Contact the area manger for mechanical maintenance to schedule the isolation of the ESP channel by closing the inlet and outlet gates of that chamber and opening the top hatches for entry into the chamber;

j. Notify the emissions control operator and melter when isolation work begins;

k. A log shall be maintained of the above checks and any actions taken as a result.

4. The crane operator shall use the following procedures, as appropriate, to minimize emissions and maximize emissions capture by the hoods:

a. Use controlled pouring of the hot metal into the BOF vessel;

b. Use careful positioning of the hot metal ladle with respect to the hood face and furnace mouth;

c. Use the most beneficial furnace tilt angle;

d. These procedures shall be posted in the crane operator booth.

APPENDIX C Emission Calculations

This appendix details the emission rate calculations utilized for the ambient air quality modeling conducted. The emission rates modeled are based on the potential to emit of various sources at the facility. The modeled emission rates are based on the maximum potential of each source to emit SO_2 taking into consideration permit limitations and physical limitations of each source.

Table C-1 details the existing and permitted (but not constructed) emission units at the Facility that have potential SO_2 emissions. Table C-1 also details the SO_2 emission limits in the SO_2 FESOP (Permit No. 94120017) and the Production Increase Permit (Permit No. 95010001). SO_2 limits detailed in the SO_2 FESOP Permit are limitations on COG combustion from specific units or groups of units. SO_2 emissions from combusting other fuels are not limited under the SO_2 FESOP permit. The Production Increase Permit limits SO_2 emissions from process emission units and fugitive emission points. SO_2 emission limits shown in Table C-1 for proposed sources such as the BFG boiler and the COG desulfurization system are based on either proposed emission rates or permit limitations for these sources.

Because SO_2 limits in the SO_2 FESOP do not include emissions from BFG or NG, modeled emission rates were adjusted up from the COG SO_2 limit to account for the maximum BFG or NG SO_2 emissions possible when burning more than one fuel. For all other units and all other averaging periods, modeled SO_2 emission rates were based on the maximum SO_2 emissions for that averaging period. Calculations for the modeled SO_2 emission rate for each emission unit are detailed below.

SO_2 emission rates were calculated utilizing the SO_2 emission factors detailed in Table C-2 and the heat capacities for the individual fuels (560 MMBtu/MMscf for COG, 80 MMBtu/MMscf for BFG, and 1000 MMBtu/MMscf for NG).

Table C- 1: Facility SO_2 Emission Limits

Stack Number	Description	Throughput	Maximum Design Rate	Design Rate Units	SO_2 Emission Limits		
					3-hour (lb/3-hr)	24-hour (lbs./day)	Annual (tpy)

Slab Ripping	NG	0.60	lbs/MMscf
Slag Pits	Iron	0.01	lbs/ton

BF0007S – Blast Furnace 'A' Stoves

The BF Stoves utilize BFG, COG, and NG as fuels and have 24 hour and annual SO_2 limits. Modeled emission rates for the 3-hour averaging period are based on the maximum SO_2 emission rate. Emission rates for the 24-hour period are based on the COG limit for both Blast Furnace stove stacks divided by 2 and the potential BFG contribution at max COG. The annual rate is based on the potential emissions from desulfurized COG as a result of the reduced allowable emissions under the COG desulfurization permit.

Maximum Design Rate – 399 MMBtu/hour

Max. SO_2 emission rate = 399 * 1230 (lbs. SO_2 / MMscf) / 560 (MMBtu / MMscf) = 876.38 lbs. / hr.

24-hr emission rate (lbs./hour) = Limit (lbs./day) / 24 (hours/day) / 2 (stoves)+ {399-[limit/24/2(lbs/hour)*560 (MMBtu/MMscf) / 1230 (lbs/MMscf)]} * 16 lbs./MMscf / 80 (MMBtu/MMscf) = 411.96 + 42.35 = 454.31 lbs./hr

Annual emission rate (lbs./hour) = 399 (MMBtu / hour) * 177.54 (lbs/MMscf) / 560 (MMBtu/MMscf) = 126.50 lbs./hr

BF0012S – Blast Furnace 'B' Stoves

The BF Stoves utilize BFG, COG, and NG as fuels and have 24 hour and annual SO_2 limits. Modeled emission rates for the 3-hour averaging period are based on the maximum SO_2 emission rate. Emission rates for the 24-hour period are based on the COG limit for both Blast Furnace

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

stove stacks divided by 2 and the potential BFG contribution at max COG. The annual rate is based on the potential emissions from desulfurized COG as a result of the reduced allowable emissions under the COG desulfurization permit.

Maximum Design Rate – 457 MMBtu/hour

Max. SO_2 emission rate = 457 * 1230 (lbs. SO_2 / MMscf) / 560 (MMBtu / MMscf) = 1003.77 lbs. / hr.

24-hr emission rate (lbs./hour) = Limit (lbs./day) / 24 (hours/day) / 2 (stoves)+ {457-[limit/24/2(lbs/hour)*560 (MMBtu/MMscf) / 1230 (lbs/MMscf)]} * 16 lbs./MMscf / 80 (MMBtu/MMscf) = 411.96 + 53.95 = 465.91 lbs./hr

Annual emission rate (lbs./hour) = 457 (MMBtu / hour) * 177.54 (lbs/MMscf) / 560 (MMBtu/MMscf) = 144.89 lbs./hr

BF0011S & BF0111S – Blast Furnace Gas Flares

The BFG Flares combust excess BFG that can not be burned in BFG combustion units. The flares do not have any SO_2 limits except emissions from the second flare are limited to burning BFG not combusted by the BFG boiler (Cogen1). Modeled emission rates for all averaging periods are based on the maximum SO_2 emission rates for both flares and do not take into account limits on the second flare for simplicity reasons.

Maximum Design Rate – 720 MMBtu/hour

Max. SO_2 emission rate = 720 * 16 (lbs. SO2 / MMscf) / 80 (MMBtu / MMscf) = 144.00 lbs. / hr.

UT0053S – Boilers 1 through 7

Boilers 1 through 7 utilize BFG, COG, and NG as fuels and have 24-hour and annual SO_2 limits. Modeled emission rates for the 3-hour averaging period are based on the maximum SO_2 emission rate. Emission rates for the 24-hour period are based on the COG limit for Boilers 1 through 7 and 8 through 10 combined prorated based on 7 out of 10 boilers exhausting through this stack and the potential BFG contribution at max COG. The annual rate is based on the potential emissions from desulfurized COG as a result of the reduced allowable emissions under the COG desulfurization permit.

Maximum Design Rate – 420 MMBtu/hour (7 boilers @ 60 MMBtu / hour each)

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Max. SO_2 emission rate = 420 * 1230 (lbs. SO_2 / MMscf) / 560 (MMBtu / MMscf) = 922.50 lbs. / hr.

24-hr emission rate (lbs./hour) = Limit (lbs./day) / 24 (hours/day) / 10 (boilers)* 7 + {420-[limit/24*7/10 (lbs/hour)*560 (MMBtu/MMscf) / 1230 (lbs/MMscf)]} * 16 lbs./MMscf / 80 (MMBtu/MMscf) = 591.65+30.21 = 621.86 lbs./hr

Annual emission rate (lbs./hour) = 420 (MMBtu / hour) * 177.54 (lbs/MMscf) / 560 (MMBtu/MMscf) = 133.15 lbs./hr

UT0054S – Boilers 8 through 10

Boilers 8 through 10 utilize BFG, COG, and NG as fuels and have 24-hour and annual SO_2 limits. Modeled emission rates for the 3-hour averaging period are based on the maximum SO_2 emission rate. Emission rates for the 24-hour period are based on the COG limit for Boilers 1 through 7 and 8 through 10 combined prorated based on 3 out of 10 boilers exhausting through this stack and the potential BFG contribution at max COG. The annual rate is based on the potential emissions from desulfurized COG as a result of the reduced allowable emissions under the COG desulfurization permit.

Maximum Design Rate – 180 MMBtu/hour (3 boilers @ 60 MMBtu / hour each)

Max. SO_2 emission rate = 180 * 1230 (lbs. SO_2 / MMscf) / 560 (MMBtu / MMscf) = 396.00 lbs. / hr.

24-hr emission rate (lbs./hour) = Limit (lbs./day) / 24 (hours/day) / 10 (boilers)*3 + {180-[limit/24*3/10 (lbs/hour)*560 (MMBtu/MMscf) / 1230 (lbs/MMscf)]} * 16 lbs./MMscf / 80 (MMBtu/MMscf) = 253.56 + 12.95 = 266.51 lbs./hr

Annual emission rate (lbs./hour) = 180 (MMBtu / hour) * 177.54 (lbs/MMscf) / 560 (MMBtu/MMscf) = 57.07 lbs./hr

UT0059S & UT0064S – Boilers 11 & 12

Boilers 11 &12 utilize BFG, COG, and NG as fuels and have 24-hour and annual SO_2 limits. Modeled emission rates for the 3-hour averaging period are based on the maximum SO_2 emission rate. Emission rates for the 24-hour period are based on the COG limit for Boilers 11 & 12 combined divided by 2 and the potential BFG contribution at max COG. The annual rate is

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

based on the potential emissions from desulfurized COG as a result of the reduced allowable emissions under the COG desulfurization permit.

Maximum Design Rate – 225 MMBtu/hour

Max. SO_2 emission rate = 225 * 1230 (lbs. SO_2 / MMscf) / 560 (MMBtu / MMscf) = 494.20 lbs. / hr.

24-hr emission rate (lbs./hour) = Limit (lbs./day) / 24 (hours/day) / 2 boilers + {225 -[limit/24 (lbs/hour) / 2 (boilers) *560 (MMBtu/MMscf) / 1230 (lbs/MMscf)]} * 16 lbs./MMscf / 80 (MMBtu/MMscf) = 428.83 + 6.02 = 434.85 lbs./hr

Annual emission rate (lbs./hour) = 225 (MMBtu / hour) * 177.54 (lbs/MMscf) / 560 (MMBtu/MMscf) = 71.33 lbs./hr

NOTE: The second component of the 24-hr emission rate equation equals 5.95 as written, but appears as 6.02 due to rounding in the calculations.

BP0097S – COG Flare

Because more COG is accounted for in the modeling than can be combusted at any time at the GCW, no emissions are accounted for at the COG Flare.

CO0071S & CO0092S – Coke Oven Battery Underfire

Coke Oven Battery Underfire utilizes COG and a small amount of NG as fuels and has no SO_2 limits. Modeled emission rates for the short term (3-hour and 24-hour) averaging periods are based on the maximum SO_2 emission rate. Because the potential contribution of SO_2 from NG is less than 0.01 lbs./ hr for both batteries combined, emissions from NG are considered insignificant for this unit and excluded from the analysis. The annual rate is based on the potential emissions from desulfurized COG as a result of the reduced allowable emissions under the COG desulfurization permit.

Maximum Design Rate – 175 MMBtu/hour

Max. SO_2 emission rate = 175 * 1230 (lbs. SO_2 / MMscf) / 560 (MMBtu / MMscf) = 384.38 lbs. / hr.

Annual emission rate (lbs./hour) = 175 (MMBtu / hour) * 177.54 (lbs/MMscf) / 560 (MMBtu/MMscf) = 55.48 lbs./hr

FIN0016S, FIN0020S & FIN0024S – Hot Strip Slab Furnaces 1 through 3

Slab Furnaces 1 through 3 utilize COG and NG as fuels and have 3-hour, 24-hour and annual SO_2 limits. Modeled emission rates for the 3-hour, 24-hour and the annual averaging period are based on the COG limit for Hot Strip Slab Furnaces 1 through 3 combined divided by 3 and the potential NG contribution at max COG.

Maximum Design Rate – 322 MMBtu/hour

3-hr emission rate = Limit (lbs./3hrs) / 3 (hours/3hrs) / 3 furnaces + {322-[limit/3/3 (lbs/hour) * 560 (MMBtu/MMscf) / 1230 (lbs/MMscf)]} * 0.6 lbs./MMscf / 1000 (MMBtu/MMscf) = 255.44 + 0.12 = 255.56 lbs./hr

24-hr emission rate (lbs./hour) = Limit (lbs./day) / 24 (hours/day) / 3 furnaces + {322-[limit/24 (lbs/hour) / 3 * 560 (MMBtu/MMscf) / 1230 (lbs/MMscf)]} * 0.6 lbs./MMscf / 1000 (MMBtu/MMscf) = 135.47 + 0.16 = 135.63 lbs./hr

Annual emission rate (lbs./hour) = Limit (tpy) * 2000 (lbs./ton) / 8760 (hours/year) / 3 furnaces + {322-[limit*2000/8760 (lbs/hour) / 3 * 560 (MMBtu/MMscf) / 177.54 (lbs/MMscf)]} * 0.6 lbs./MMscf / 1000 (MMBtu/MMscf) = 75.11 + 0.05 = 75.16 lbs./hr

FIN0028S – Hot Strip Slab Furnace 4

Slab Furnace 4 utilizes COG and NG as fuels and has a 24-hour and an annual SO_2 limit. Modeled emission rates for the 3-hour and the 24-hour averaging period are based on the COG limit for Hot Strip Slab Furnace 4 and the potential NG contribution at the COG limit. The annual rate is based on the potential emissions from desulfurized COG as a result of the reduced allowable emissions under the COG desulfurization permit.

Maximum Design Rate – 380 MMBtu/hour

3-hr emission rate = 600 lbs./hour ***Note: This emission rate was set to ensure that the facility can comply with ambient air quality standards.***

24-hr emission rate (lbs./hour) = Limit (lbs./day) / 24 (hours/day) + {380-[limit/24 (lbs/hour) * 560 (MMBtu/MMscf) / 1230 (lbs/MMscf)]} * 0.6 lbs./MMscf / 1000 (MMBtu/MMscf) = 494.71 + 0.09 = 494.80 lbs./hr

Annual emission rate (lbs./hour) = 380 (MMBtu / hour) * 177.54 (lbs/MMscf) / 560 (MMBtu/MMscf) = 120.47 lbs./hr

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

BF0010S– Casthouse Baghouse

The Casthouse Baghouse controls emissions from Blast Furnace Casting operations on both 'A' and 'B' Blast Furnaces. The baghouse controls particulate emissions, however, because the casting operation emits SO_2, the baghouse emits SO_2 also. Modeled emission rates for all averaging periods are based on the annual Production Increase Permit emission rate limit for emissions from this unit. This limit was set based on the permitted maximum production rate for the blast furnaces and the emission factor in Table A-2.

SO_2 emission rate = 422 (tpy) * 2000 (lbs./ton) / 8760 (hrs/yr) = 96.35 lbs./hr.

BF0150S– Ironspout Baghouse

The Ironspout Baghouse controls emissions from Blast Furnace Casting operations on both 'A' and 'B' Blast Furnaces. The baghouse controls particulate emissions, however, because the casting operation emits SO_2, the baghouse emits SO_2 also. Modeled emission rates for all averaging periods are based on the annual Production Increase Permit emission rate limit for emissions from this unit. This limit was set based on the permitted maximum production rate for the blast furnaces and the emission factor in Table A-2.

SO_2 emission rate = 13.89 (tpy) * 2000 (lbs./ton) / 8760 (hrs/yr) = 3.17 lbs./hr.

BOF0149S– Ladle Drying Preheaters

The Ladle Drying Preheaters are combustion emission sources using COG and NG to heat iron ladles prior to use in the BOF. Emissions from the ladle dryers are based on the SO_2 limits in the SO_2 FESOP for the short term averaging periods. The annual rate is based on the potential emissions from desulfurized COG as a result of the reduced allowable emissions under the COG desulfurization permit.

Maximum Design Rate – 100 MMBtu/hour

3-hr emission rate (lbs./hour) = Limit (lbs./3-hr) / 3 (hours) + {100 -[limit/3 (lbs/hour) *560 (MMBtu/MMscf) / 1230 (lbs/MMscf)]} * 0.6 lbs./MMscf / 1000 (MMBtu/MMscf) = 185.00 + 0.01 = 185.01 lbs./hr

24-hr emission rate (lbs./hour) = Limit (lbs./day) / 24 (hours/day) + {100 -[limit/24 (lbs/hour) * 560 (MMBtu/MMscf) / 1230 (lbs/MMscf)]} * 0.6 lbs./MMscf / 1000 (MMBtu/MMscf) = 116.08 + 0.03 = 116.11 lbs./hr

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Annual emission rate (lbs./hour) = 100 (MMBtu / hour) * 177.54 (lbs/MMscf) / 560 (MMBtu/MMscf) = 31.70 lbs./hr

CC0084S & CC0145S– Slab Cutting

The Slab Cutting emission units are combustion emission sources using NG to cut slabs after casting. Emissions from the slab cutters are insignificant based on the use of NG and the very low design rate of the units.

SO_2 emission rate = 0.3 (MMBtu/hr) * 0. 6 (lbs./MMscf) / 1000 (MMBtu/MMscf) = 0.00018 lbs./hr.

CO0069S & CO0090S – Coke Oven Battery Pushing Operations

Coke Oven Battery Pushing Operations consist of the pushing of hot coke from the battery into the quench car for travel to the quench tower. SO_2 emissions are released during the pushing operation as fugitives. Modeled emission rates for all averaging periods are based on the maximum coal processing rate and an older draft AP-42 emission factor for SO_2 from pushing shown in Table A-2. It should be noted that AP-42 no longer reports an SO_2 emission factor for pushing operations and the use of this factor should therefore be considered a conservative estimate.

Maximum Design Rate – 454,000 tons of coal per year per battery

Max. SO_2 emission rate = 454000 (tpy) / 8760 (hrs/yr) * 0.1 (lbs. SO2 / ton coal) (MMBtu / MMscf) = 5.18 lbs. / hr.

BF0008S & BF0013S – Blast Furnace Casting Fugitives

The Blast Furnace Casting Fugitives includes the uncontrolled casting emissions. Modeled emission rates for all averaging periods are based on the annual SO_2 limits for casting fugitives contained in the Production Increase Permit divided between the two Blast Furnaces.

Annual SO_2 limit from casting fugitives = 21.94 tpy

Max. SO_2 emission rate = 21.94 (tpy) * 2000 (lbs. / ton) / 8760 (hrs / yr) / 2 furnaces = 2.50 lbs. / hr.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

BF0126S– Blast Furnace Slag Pit Fugitives

The Blast Furnace Slag Pit Fugitives includes the uncontrolled SO_2 emissions emanating from the Blast Furnace Slag Pit. Modeled emission rates for all averaging periods are based on the annual SO_2 limit for slag pit fugitives contained in the Production Increase Permit.

Annual SO_2 limit from slag pit fugitives = 15.83 tpy

Max. SO_2 emission rate = 15.83 (tpy) * 2000 (lbs. / ton) / 8760 (hrs / yr) = 3.61 lbs. / hr.

CC0085S– Slab Ripping

The Slab Ripping emission units are combustion emission sources using NG to rip slabs after casting. Emissions from the slab rippers are insignificant based on the use of NG and the very low design rate of the units.

SO_2 emission rate = 3.17 (MMBtu/hr) * 0.6 (lbs./MMscf) / 1000 (MMBtu/MMscf) = 0.0019 lbs./hr.

Desulf – COG Desulfurization System Stack

The COG desulfurization system stack emits SO_2 emissions during operation of the system at a maximum rate of 66.5 lbs./hr. However, because short term modeled emission rates assume undesulfurized COG, the system stack is not modeled in the short term averaging periods. The modeled emission rate for the annual averaging period assumes maximum continuous operation.

Scenario Modeling

Emissions calculations for the emission scenarios described in section 6.8.2 are outlined in detail below. A table of fuel inputs for each scenario is shown in Table 6-13 (a) – (d). Maximum design rates, emission factors and heat capacities are identical to those used above and shown in Tables C-1 and C-2. These emissions were only used for the 24-hour scenario modeling discussed in section 6.8.2. For emissions that remain the same in multiple scenarios, the calculations are referenced rather than repeated. Modeled emission rates for each scenario are shown in Tables C3-C6. Small variances in emission rates may exist between the calculations and the tables. This is strictly due to rounding differences in the model when converting between g/s and lb/hr.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

SCENARIO 1

- Battery A and Battery B at full COG underfire
- Remaining COG to Blast Furnace Stoves "A" and "B" and Ladle Dryer

BF0007S – Blast Furnace "A" Stoves

Maximum Design Rate = 399 MMBtu/hr

COG throughput = 8.04 MMCF/day

BFG throughput = {399 (MMBtu/hr) – 8.04 (MMCF COG/day) / 24(hr/day)* 560 (MMBtu/MMCF)} * 24 (hr/day) / 80 (MMBtu/MMCF)

= 63.43 MMCF/day

COG emissions = 8.04 MMCF/day / 24 (hr/day) * 1230 (lb SO_2 / MMCF)

= 411.96 lb SO_2/hr

BFG emissions = 63.43 MMCF/day / 24 (hr/day) * 16 (lb SO_2 / MMCF)

= 42.29 lb SO_2/hr

SO_2 emission rate = 411.96 + 42.29 = 454.25 lb/hr

BF0012S – Blast Furnace "B" Stoves

Maximum Design Rate = 457 MMBtu/hr

COG throughput = 8.04 MMCF/day

BFG throughput = {457 MMBtu/hr – 8.04 (MMCF COG/day) / 24(hr/day)* 560 (MMBtu/MMCF)} * 24 (hr/day) / 80 (MMBtu/MMCF)

= 80.83 MMCF/day

COG emissions = 8.04 MMCF/day / 24 (hr/day) * 1230 (lb SO_2 / MMCF)

= 411.96 lb SO_2/hr

BFG emissions = 80.83 MMCF/day / 24 (hr/day) * 16 (lb SO_2 / MMCF)

= 53.89 lb SO_2/hr

SO_2 emission rate = 411.96 + 53.89 = 465.85 lb/hr

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

BF0011S & BF0111S – Blast Furnace Gas Flares

Maximum Design Rate = 720 MMBtu/hr

SO_2 emission rate = BFG emissions = 720 (MMBtu/hr) * 16 (lbs. SO_2 / MMscf) / 80 (MMBtu / MMscf) = 144.00 lb/hr

UT0053S – Boilers 1 -7

Maximum Design Rate = 420 MMBtu/hr

SO_2 emission rate = BFG emissions = 420 (MMBtu/hr) / 80 (MMBtu/MMCF) * 16 (lb SO_2/MMCF) = 84.00 lb/hr

UT0054S – Boilers 8 – 10

Maximum Design Rate = 180 MMBtu/hr

SO_2 emission rate = BFG emissions = 180 (MMBtu/hr) / 80 (MMBtu/MMCF) * 16 (lb SO_2/MMCF) = 36.00 lb/hr

UT0059S & UT0064S – Boilers 11 & 12

Maximum Design Rate = 225 MMBtu/hr (each)

SO_2 emission rate = BFG emissions = 225 (MMBtu/hr) / 80 (MMBtu/MMCF) * 16 (lb SO_2/MMCF) = 45.00 lb/hr (each)

BP0097S – COG Flare

No emissions modeled

CO0071S & CO0092S – Coke Oven Battery Underfire

Maximum Design Rate = 175 MMBtu/hr (each)

SO_2 emission rate = COG emissions = 175 (MMBtu/hr) / 560 (MMBtu/MMCF) * 1230 (lb SO_2 / MMCF) = 384.38 lb/hr (each)

FIN0016S, FIN0020S, FIN0024S – Hot Strip Slab Furnaces 1-3

Maximum Design Rate = 322 MMBtu/hr (each)

SO_2 emission rate = NG emissions = 322 (MMBtu/hr) / 1000 (MMBtu/MMCF) * 0.6 (lb SO_2/MMCF) = 0.19 lb/hr (each)

FIN0028S – Hot Strip Slab Furnace 4

Maximum Design Rate = 380 MMBtu/hr

SO_2 emission rate = NG emissions = 380 (MMBtu/hr) / 1000 (MMBtu/MMCF) * 0.6 (lb SO_2/MMCF) = 0.23 lb/hr

BOF0149S – Ladle Drying Preheaters

Maximum Design Rate = 100 MMBtu/hr

COG throughput = 2.27 MMCF/day

NG throughput = {100 (MMBtu/hr) – 2.27 (MMCF COG/day) / 24 (hr/day) * 560 (MMBtu/MMCF)}* 24 (hr/day) / 1000 (MMBtu/MMCF)

=1.13 MMCF/day

COG emissions = 2.27 (MMCF/day) / 24 (hr/day) * 1230 (lb SO_2 / MMCF)

= 116.08 lb/hr

NG emissions = 1.13 MMCF/day / 24 (hr/day) * 0.6 (lb SO_2 / MMCF)

= 0.03 lb/hr

SO_2 emission rate = 116.08 + 0.03 = 116.11 lb/hr

CC0084S & CC0145S – Slab Cutting

Maximum Design Rate = 0.3 MMBtu/hr

SO_2 emission rate = 0.3 (MMBtu/hr) / 1000 (MMBtu/MMCF) * 0.6 (lb SO_2/MMCF) = 1.8x10(-4) lb/hr

SCENARIO 2

- Battery A and Battery B at maximum COG underfire
- Remaining COG to boilers 1 -10

BF0007S – Blast Furnace "A" Stoves

Maximum Design Rate = 399 MMBtu/hr

SO_2 emission rate = BFG emissions = 399 (MMBtu/hr) / 80 (MMBtu/MMCF) * 16 (lb SO_2/MMCF) = 79.8 lb/hr

IN THE CIRCUIT COURT FOR THE THIRD JUDICIAL CIRCUIT
MADISON COUNTY, ILLINOIS

FILED
DEC 18 2007
CLERK OF CIRCUIT COURT 3rd
THIRD JUDICIAL CIRCUIT
MADISON COUNTY, ILLINOIS

PEOPLE OF THE STATE OF ILLINOIS, *ex rel.*, LISA MADIGAN, Attorney General of the State of Illinois, Plaintiff,	)	
v.	)	No. 05-CH-750
UNITED STATES STEEL CORPORATION, INC., a Delaware Corporation, Defendant.	)	

CONSENT ORDER

Plaintiff, PEOPLE OF THE STATE OF ILLINOIS, *ex. rel.* LISA MADIGAN, Attorney General of the State of Illinois, the Illinois Environmental Protection Agency ("Illinois EPA"), and Defendant, UNITED STATES STEEL CORPORATION (incorrectly identified as UNITED STATES STEEL CORPORATION, INC.), have agreed to the making of this Consent Order and submit it to this Court for approval.

I. INTRODUCTION

This stipulation of facts is made and agreed upon for purposes of settlement only and as a factual basis for the Court's entry of the Consent Order. None of the facts stipulated herein shall be introduced into evidence in any other proceeding regarding the violations of the Illinois Environmental Protection Act ("Act"), 415 ILCS 5/1, *et seq.* (2006), and the Illinois Pollution Control Board ("Board") Regulations, alleged in the Complaint, except as otherwise provided herein. It is the intent of the Plaintiff and Defendant to this Consent Order that it be a final judgment on the merits of this matter.

A. Parties

1. On September 14, 2005, a Complaint was filed on behalf of the People of the State of Illinois by Lisa Madigan, Attorney General of the State of Illinois, on her own motion and upon the request of the Illinois EPA pursuant to Section 42(d) and (e) of the Act, 415 ILCS 5/42(d) and (e) (2006), against the Defendant. On November 27, 2006, the People moved to supplement the complaint with an additional count, Count VII, to the complaint. That motion was granted on December 7, 2006, and the First Supplemental Complaint was entered. On October 16, 2007, the Plaintiff and Defendant entered a stipulation in which the People requested permission to file a Second Supplemental Complaint to add Counts VIII and IX and Defendant did not object. On October 17, 2007, the request was granted and the Second Supplemental Complaint was entered.

2. The Illinois EPA is an administrative agency of the State of Illinois, created pursuant to Section 4 of the Act, 415 ILCS 5/4 (2006).

3. At all times relevant to the Complaint, Defendant United States Steel Corporation was and is a Delaware corporation that is authorized to transact business in the State of Illinois, and owned and operated integrated iron and steel mill located at 20th Street and State Street, Granite City, Madison County, Illinois ("steel mill").

B. Allegations of Non-Compliance

As set forth in Plaintiff's Complaint, Plaintiff's First Supplemental Complaint, and Plaintiff's Second Supplemental Complaint, Plaintiff contends that the Defendant has violated the following provisions of the Act and Board Regulations:

Count I:	Sections 9(a) and (b) of the Act, 415 ILCS 5/9(a), (b) (2006), Sections 212.324(f), 212.207, and 212.309(a) of the Board's Air

	Pollution Regulations, 35 Ill. Adm. Code 212.324(f), 212.207, 212.309(a) and operating permit 83050042.
Count II:	Sections 9(a) and (b) of the Act, 415 ILCS 5/9(a), (b) (2006), Section 212.443(c)(1)(A) of the Board's Air Pollution Regulations, 35 Ill. Adm. Code 212.443(c)(1)(A), Standard Condition 7 and Special Conditions 1(a) & (b) of operating permit 88070071 and Special Condition 2(b) of operating permit 82060043.
Count III:	Sections 9(a) and (b) of the Act, 415 ILCS 5/9(a), (b), (2006), Sections 212.307 and 212.309(a) of the Board's Air Pollution Regulations, 35 Ill. Adm. Code 212.307 and 212.309(a), and Standard Condition 7 of operating permit 72080034 and 72080036.
Count IV:	Sections 9(a), (b) and 9.1(d) of the Act, 415 ILCS 5/9(a), (b), 9.1(d) (2006), 40 CFR 63.304(b)(2)(iv), Sections 212.443(b)(1)(A) and 201.141 of the Board's Air Pollution Regulations, 35 Ill Adm. Code 212.443(b)(1)(A) and 201.141, Special Condition 5 of operating permit 80050010, and Special Condition 6 of operating permit 82060043.
Count V:	Sections 9(a) and (b) of the Act, 415 ILCS 5/9(a), (b), (2006), Section 201.141 of the Board's Air Pollution Regulations, 35 Ill. Adm. Code 201.141, Special Condition 18 of revised operating permit 95010001.
Count VI:	Sections 9(a) and 9.1(d) of the Act, 415 ILCS 5/9(a), 9.1(d) (2006), Section 40 CFR 63.309(b)(2)(i)(B), and Sections 212.443(d)(2) and 201.141 of the Board's Air Pollution Regulations, 35 Ill. Adm. Code 212.443(d)(2) and 201.141.
Count VII:	Section 9(a) of the Act, 415 ILCS 5/9(a) (2006).
Count VIII:	Sections 9(a) and 9(b) of the Act, 415 ILCS 5/9(a), (b) (2006), Section 212.446(c) of the Board's Air Pollution Regulations, 35 Ill. Adm. Code 212.446(c), and Condition 8 of Defendant's Operating Permit #95010001.
Count IX:	Sections 9.1(d)(1), (d)(2) and 9(b) of the Act, 415 ILCS 5/9.1(d)(1), (d)(2), 9(b) (2006), Sections 165(a)(1) and 165(a)(4) of the Clean Air Act, 42 U.S.C.A. § 7475(a)(1), (a)(4) (2006), 40 CFR 52.21(j)(l) and (j)(3), and 40 CFR 52.21(r)(l), and Condition 22 of Defendant's Operating Permit #95010001.

C. **Non-Admission of Violation**

The Defendant represents that it has entered into this Consent Order for the purpose of settling and compromising disputed claims without having to incur the expense of contested litigation. By entering into this Consent Order and complying with its terms, the Defendant does not affirmatively admit the allegations of violation within the Complaint and referenced above, and this Consent Order shall not be interpreted as including such admission.

D. **Compliance Activities to Date**

1. The Ladle Metallurgy Facility ("LMF")

a. Defendant developed and implemented mechanical and electrical inspection procedures to assure proper operation of the No. 1 baghouse. Defendant also modified the discharge chute of the No. 1 baghouse to maintain a positive connection between the chute and the plastic tote bag used to contain the captured baghouse dust. Also, Defendant modified the synthetic slag addition emission collection hood to improve capture efficiency.

2. The Coke Oven Pushing Operation

a. Defendant revised and implemented its enhanced operating and maintenance plan for its coke oven pushing operations.

b. Defendant completed the installation of the constant heat system for Coke Batteries A and B to provide more consistent heating of the batteries.

c. Defendant completed the installation of the coke guide pyrometers for Coke Batteries A and B to evaluate the carbonization of the coke mass during the push.

d. Defendant completed the installation of the direct spray primary cooler for the Coke Plant By-Products Facility to improve the coke oven gas quality to minimize fouling of the battery underfire systems.

e. Defendant completed the implementation of the data analysis system to predict the heat input for complete carbonization of the coke mass.

3. Blast Furnaces A and B

a. Defendant modified the iron spout baghouse fume collection hoods to minimize hood openings. Defendant has also completed repairs to iron spout baghouse dust handling screw conveyor system and fume collection ductwork.

4. The Coke Oven By-Products Plant

a. Defendant made appropriate repairs to all exhausters. Operating and maintenance procedures have been implemented to prevent recurrence.

5. The Slag Skimming Station Baghouse

a. Defendant installed a new multi-compartment baghouse to collect and control hot metal slag skimming emissions.

6. Coke Oven Doors

a. Defendant implemented NESHAP work practices in accordance with 40 CFR 63, Subpart L.

b. Defendant took steps to ensure an adequate supply of coke oven doors, including by entry into a relationship with a new local contractor to rebuild coke oven doors as necessary.

7. Air Pollution Violation

a. At the time of the coke oven gas release on February 28, 2006, Defendant maximized the consumption of coke oven gas and reduced coke oven operations to minimize the amount of coke oven gas released. The failed linkage to the flare stack butterfly valve was repaired, re-establishing flow of excess coke oven gas to the flare stack.

8. The Basic Oxygen Furnace

a. Defendant completed extensive repairs to the Basic Oxygen Furnace air pollution capture and control equipment and implemented an enhanced inspection and maintenance program for the Basic Oxygen Furnace.

b. Defendant has retained an engineering consultant to evaluate the significant sources of Basic Oxygen Furnace roof emissions and to identify options for additional emissions reductions.

9. The Blast Furnace Gas SO2 Emissions

a. Defendant completed SO2 modeling required for the application to revise the PSD Construction Permit.

II. APPLICABILITY

This Consent Order shall apply to and be binding upon the Plaintiff and the Defendant, and any officer, director, agent, or employee of the Defendant, as well as any successors or assigns of the Defendant. The Defendant waives as a defense to any enforcement action taken pursuant to this Consent Order the failure of any of its officers, directors, agents, employees or successors or assigns to take such actions as shall be required to comply with the provisions of this Consent Order. This Consent Order may be used against the Defendant in any subsequent enforcement action or permit proceeding as proof of a past adjudication of violation of the Act and the Board Regulations for all violations alleged in the Complaint in this matter, for purposes of Sections 39, 39.5, and 42 of the Act, 42 ILCS 5/39, 5/39.5, and 5/42 (2006).

The Defendant shall notify each contractor to be retained to perform work required in this Consent Order of each of the requirements of this Consent Order relevant to the activities to be performed by that contractor, including all relevant work schedules and reporting deadlines, and

shall provide a copy of this Consent Order to each contractor already retained no later than thirty (30) calendar days after the date of entry of this Consent Order. In addition, the Defendant shall provide copies of all schedules for implementation of the provisions of this Consent Order to the prime vendor(s) supplying the control technology systems and other equipment required by this Consent Order.

No change in ownership, corporate status or operator of the facility shall in any way alter the responsibilities of the Defendant under this Consent Order. In the event that the Defendant proposes to sell or transfer any real property or operations subject to this Consent Order, the Defendant shall notify the Plaintiff thirty (30) calendar days prior to the conveyance of title, ownership or other interest, including a leasehold interest in the facility or a portion thereof. Defendant shall make as a condition of any such sale or transfer, that the purchaser or successor provide to Defendant site access and all cooperation necessary for Defendant to perform to completion any compliance obligation(s) required by this Consent Order. The Defendant shall provide a copy of this Consent Order to any such successor in interest and the Defendant shall continue to be bound by and remain liable for performance of all obligations under this Consent Order. In appropriate circumstances, however, the Defendant and a proposed purchaser or operator of the facility may jointly request, and the Plaintiff, in its discretion, may consider modification of this Consent Order to obligate the proposed purchaser or operator to carry out future requirements of this Consent Order in place of, or in addition to, the Defendant. This provision does not relieve the Defendant from compliance with any regulatory requirement regarding notice and transfer of applicable facility permits or permit applications.

III. JUDGMENT ORDER

This Court has jurisdiction of the subject matter herein and of the Plaintiff and Defendant consenting hereto and, having considered the stipulated facts and being advised in the premises, finds the following relief appropriate:

IT IS HEREBY ORDER, ADJUDGED AND DECREED:

A. Penalty

The Defendant shall pay a civil penalty of Three-Hundred Thousand Dollars ($300,000.00) within thirty (30) days of the date of entry of this Consent Order in a manner prescribed below.

B. Stipulated Penalties, Interest and Default

1. If the Defendant fails to complete any activity or fails to comply with any response or reporting requirement by the date specified in this Consent Order, the Defendant shall provide notice to the Plaintiff of each failure to comply with this Consent Order and shall pay stipulated penalties in the amount of $500.00 per day per violation until such time that compliance is achieved. The Plaintiff shall make a demand for stipulated penalties upon the Defendant for its noncompliance with this Consent Order. However, failure by the Plaintiff to make this demand shall not relieve the Defendant of the obligation to pay stipulated penalties. All stipulated penalties shall be payable within thirty (30) calendar days of the date of Plaintiff's demand for stipulated penalties upon the Defendant for its noncompliance with any provision of this Consent Order.

2. If the Defendant fails to make any payment required by this Consent Order on or before the date upon which the payment is due, the Defendant shall be in default and the remaining unpaid balance of the penalty plus any accrued interest, shall be due and owing

immediately. In the event of default, the Plaintiff shall be entitled to reasonable costs of collection, including reasonable attorney's fees.

3. Pursuant to Section 42(g) of the Act, interest shall accrue on any penalty amount owed by the Defendant not paid within the time prescribed herein. Interest on unpaid penalties shall begin to accrue from the date such are due and continue to accrue to the date full payment is received. Where partial payment is made on any penalty amount that is due, such partial payment shall be first applied to any interest on unpaid penalties then owing.

C. Payment Procedures

All payments required by this Consent Order shall be made by certified check or money order payable to the Illinois EPA for deposit into the Environmental Protection Trust Fund ("EPTF"). Payments shall be sent by first class mail and delivered to:

Illinois Environmental Protection Agency
Fiscal Services
1021 North Grand Avenue East
P.O. Box 19276
Springfield, IL 62794-9276

The name, case number and the Defendant's federal tax identification number shall appear on the face of the certified check or money order. A copy of the certified check or money order and any transmittal letter shall be sent to:

Environmental Bureau
Illinois Attorney General's Office
500 South Second Street
Springfield, IL 62706

D. Future Compliance

1. General Compliance

a. The Attorney General, her employees and representatives, shall have the right of entry into and upon the Defendant's facility that is the subject of this Consent Order, at all reasonable times for the purposes of conducting inspections and evaluating compliance status. In conducting such inspections, the Attorney General, her employees and representatives, may take photographs, samples, and collect information, as they deem necessary, and shall comply with all of the Defendant's safety requirements for all personnel entering the Defendant's facility.

b. This Consent Order in no way affects the responsibilities of the Defendant to comply with any other federal, state or local laws or regulations, including but not limited to the Act and the Board Regulations.

c. The Defendant shall cease and desist from future violations of the Act and state and federal regulations that were the subject matter of the complaint, except that, for those violations covered by compliance schedules set forth in III.D.2, 3, and 4, implementation of the cease and desist requirement shall be consistent with the compliance schedule.

2. Compliance Schedule for the Uncaptured Emissions from the Coke Oven Pushing Operation

a. Coke Oven Pushing Opacity Reading Methodology and Limitations

i. Opacity reading methodology and limitations for uncaptured emissions from the coke oven pushing operation

The following methods shall be utilized to conduct opacity readings of uncaptured particulate matter emissions from pushing operations at Coke Oven Battery A and B during the initial and additional compliance demonstrations.

Opacity readings shall be taken by a qualified observer located in a position where the oven being pushed, the coke receiving car, and the path to the quench tower are visible. The opacity shall be read as the emissions rise and clear the top of the coke battery gas mains. The opacity readings shall be taken in accordance with the procedures set forth in 40 CFR 60, Appendix A, Method 9. Opacity readings shall be taken at 15-second intervals, beginning from the time the coke falls into the receiving car or is first visible as it emerges from the coke guide, whichever is first.

The qualified observer shall record opacity readings of pushing emissions originating at the receiving car and associated equipment and the coke oven, including the standpipe on the coke side of the oven being pushed. The qualified observer referenced shall be certified pursuant to 40 CFR 60, Appendix A, Method 9. The data reduction of Section 2.5 of 40 CFR 60, Appendix A, Method 9 shall not be used.

ii. Battery specific methodology and limitations

For Coke Oven Battery A, the readings shall begin as referenced above and continue until the receiving car enters the quench tower or quenching device. The emissions of uncaptured particulate matter from pushing operations shall not exceed an average of 20 percent opacity for four (4) consecutive pushes considering the highest average of six (6) consecutive readings in each push. For a push with a duration of less than 90-seconds, the actual number of 15-second readings will be averaged.

For Coke Oven Battery B, the readings shall begin as referenced above and end with the sixth reading. The emissions of uncaptured particulate matter shall not exceed 20 percent opacity based on the average of the six (6) consecutive readings.

b. Compliance Demonstration

i. Within forty-five (45) days of entry of this Consent Order, Defendant shall demonstrate that the uncaptured emissions from the coke oven pushing operation comply with the 20% opacity limitations consistent with the procedures in Section III.D.2.a. The Defendant's visible emissions readings shall occur over a period of three (3) consecutive days, if possible given the meteorological conditions, but regardless of the conditions, the three (3) days of readings must occur over a period no longer than five (5) days. During this period, Defendant shall read a minimum of twenty (20) pushes per day, with readings from at least eight (8) pushes per each battery per day.

ii. Within 15 days of entry of this order, or January 3, 2008, whichever is later, Defendant shall submit a protocol(s) to the Illinois EPA for review and comment, which protocol shall address the opacity testing required under Section III.D.2.b.i and Section III.D.2.c.i. The test protocol shall describe the specific procedures for testing and include at a minimum:

(a) The test date.

(b) A requirement for final confirmation to the Illinois EPA Field Operations Section and the Compliance Assurance and Source Monitoring Section of the test date and time of the test at least five (5) days prior to the test date.

(c) The identification of individual(s)/entity conducting the test.

(d) The specific conditions under which testing will be performed.

(e) The test methodology, consistent with Section III.D.2.a.

(f) The format and content of the final test report.

iii. Within 30 days of the conclusion of the compliance demonstration required by Section III.D.2.b.i, Defendant shall prepare a final report of its compliance demonstration and submit the report to the Illinois EPA. That report shall include, but not be limited to:

(a) A descriptive and table summary of results.

(b) General information including but not limited to the name, location and identification of the emission source(s) tested, date(s) of testing, names of personnel and entities performing the tests, and Illinois EPA observers, if any.

(c) A detailed description of test conditions.

(d) Data and calculations, including copies of all raw data sheets with all recorded observations regardless of whether used to determine compliance.

(e) The test methods, consistent with Section III.D.2.a.

c. Additional Compliance Demonstration

i. By March 31, 2008, for both Batteries, using the protocol(s) approved per paragraph D.2.b.ii., above, Defendant shall demonstrate that the uncaptured emissions from coke oven pushing operation comply with the 20% opacity limitations consistent with the procedures in Section III.D.2.a. To this end, Defendant shall perform opacity testing on each oven and further shall observe at least four (4) pushes on each battery per day.

ii. Within 30 days of the conclusion of this additional compliance demonstration, Defendant shall prepare a report of its additional compliance demonstration and submit the report to the Agency. That report shall include, but not be limited to:

(a) A descriptive and table summary of results.

(b) General information including but not limited to the name, location and identification of the emission source(s) tested,

date(s) of testing, names of personnel and entities performing the tests, and Illinois EPA observers, if any.

(c) Detailed description of test conditions.

(d) Data and calculations, including copies of all raw data sheets with all recorded observations regardless of whether used to determine compliance.

(e) The test methods, consistent with Section III.D.2.a.

iii. In the event that during the additional compliance demonstration, Defendant observes an exceedance of the opacity limitations applicable to uncaptured emissions from the Coke Oven Pushing operation, Defendant shall: (A) provide notification of such exceedance by electronic mail or facsimile to the Illinois EPA Bureau of Air Field Inspector assigned to the U. S. Steel Granite City Works, and to the Illinois EPA Bureau of Air Field Operations Section Manager at the Collinsville Regional Office, within five days of such observation; and (B) submit a certified written report regarding such exceedance to Illinois EPA within fifteen days of such observation. Such written report shall address, to the extent known, the cause of the exceedance, any steps taken to mitigate the exceedance and any steps taken or to be taken by Defendant to prevent such exceedance from reoccurring.

d. Within 30 days of entry of this order, Defendant shall submit a copy of the MACT Operations and Maintenance Plan for the coke ovens, as required by 40 CFR Part 63, Subpart CCCCC, and as enhanced in accordance with Defendant's written responses to comments that have been tendered to Defendant by the Illinois EPA, including but not limited to comments regarding the quench box, pushing control system spare diesel engines, timeframe for implementing repairs, and procedures for identifying green ends, to the Illinois EPA contacts referenced in Section III.H. of this order.

e. Continuing Compliance for Uncaptured Emissions from Coke Oven Pushing Operation.

i. In the event uncaptured pushing emissions at an oven in Battery A or Battery B exceed the 20% opacity limit pursuant to the procedures in Section III.D.2.a, Defendant shall determine the cause of the exceedance and shall implement necessary measures, including any corrective actions and/or preventative measures. Defendant shall prepare and maintain a record of any such event.

ii. Defendant shall adhere to the most current enhanced MACT Operations and Maintenance Plan for the coke ovens, as required by 40 CFR Part 63, Subpart CCCCC, and as revised in accordance with paragraph III.D.2.d. above, which plan prescribes operations and maintenance procedures as well as monitoring. Such plan shall be reviewed at least quarterly and amended by the Defendant, as necessary, within 30 days after the end of each quarter, so that the plan is current and sufficient to assure compliance with 40 CFR Part 63, Subpart CCCCC, 35 Ill. Adm. Code 212.443(c)(1)(A) and (B), and the consent decree with appendix entered in *United States of America* v. *National Steel Corporation*, civil action no. 81-3009.

iii. Defendant shall read at least four (4) consecutive pushes per day at Battery A and one (1) push per day at Battery B in accordance with the procedures in Section III.D.2.a.

3. Compliance Schedule for the Basic Oxygen Furnace

a. Within 30 days of entry of this order, Defendant shall submit a copy of the enhanced inspection and maintenance program for the Basic Oxygen Furnace to the Illinois EPA.

b. By January 31, 2008, Defendant shall complete an engineering study regarding an evaluation of the significant sources of Basic Oxygen Furnace shop roof emissions, including an evaluation of the sufficiency of: current operating practices and parameters and current air pollution capture and control equipment. The engineering study also shall identify options for additional reductions in emissions from the roof of the Basic Oxygen Furnace shop.

c. By February 29, 2008, Defendant shall submit the results of the engineering study to Plaintiff for its review.

d. By March 31, 2008, Defendant shall submit a compliance schedule detailing the recommendations that will be implemented and the schedule for such implementation. Any recommendations from the engineering study that the Defendant proposes to not implement must be accompanied by a detailed justification as to why. Defendant shall be required to implement such recommendations or other measures necessary to assure compliance. The compliance schedule shall also include the other measures necessary to assure compliance with the Act and state and federal regulations including but not limited to operating practices, maintenance practices and monitoring that will be implemented, and the schedule for such implementation.

e. By June 30, 2008, Defendant shall have implemented the compliance schedule as described above.

f. By July 31, 2008, Defendant shall demonstrate compliance with the requirements of Section 212.446(c) of the Board's Air Pollution Regulations, 35 Ill. Adm. Code 212.446(c), with compliance based upon the compliance determination methodology specified herein at III.D.3.g. In the interim, Defendant shall continue its implementation of the enhanced inspection and maintenance program for the Basic Oxygen Furnace shop.

g. The compliance demonstration shall consist of Method 9 opacity readings from openings in the building housing the Basic Oxygen Furnace shop. Such readings must be conducted for three (3) one-hour periods per day, two (2) days per week for four (4) weeks beginning July 1, 2008, and ending July 31, 2008. Compliance shall be determined in accordance with 40 CFR Appendix A, Method 9 except that compliance shall be determined by averaging any 12 consecutive observations taken at 15 second intervals.

h. By June 1, 2008, Defendant shall submit a protocol(s) to the Illinois EPA for review and comment that shall address the opacity testing required under Section III.D.3.f above. The test protocol shall describe the specific procedures for testing and include at a minimum:

(i) The identification of individual(s)/entity conducting the test.

(ii) The specific conditions under which testing will be performed including but not limited to the manner of operation of the Basic Oxygen Furnace.

(iii) The test methodology, consistent with Section III.D.3.g.

(iv) The format and content of the final test report.

i. By March 31, 2008, Defendant shall submit to Plaintiff a request for modification, pursuant to Section III.F.2 of this Consent Order, to modify the compliance deadline of July 31, 2008, consistent with Section III.D.3.d and for the purposes of Section III.D.3.f.

j. Defendant shall submit a quarterly progress report to the Plaintiff for the first quarter of 2008, by May 1, 2008. Each quarter thereafter, Defendant shall submit a

quarterly report, until such time as the compliance plan as been fully implemented and the source has returned to compliance, within 30 days of the end of the quarter.

4. Compliance Schedule for the Blast Furnace Gas SO2 Emissions

a. On or before January 31, 2008, Defendant shall prepare and submit to the Illinois EPA a complete and accurate application, including required SO2 modeling, to revise the PSD Construction Permit for the Production Increase, issued by the Illinois EPA on July 23, 1996 (Application No. 95010001), as necessary to reflect the corrected emission factor for the Blast Furnace Gas SO2 emissions.

b. In the interim, Defendant shall use the correct emission factor for the Blast Furnace Gas SO2 emissions in calculating, recording, and reporting SO2 emissions and for any other purposes under the Act.

c. Defendant shall work with the Illinois EPA, including providing additional information to the Illinois EPA, when requested, and shall obtain a revised PSD Construction Permit to resolve the Blast Furnace Gas SO2 Emissions issue.

d. Defendant shall submit a quarterly progress report to the Plaintiff for the first quarter of 2008, by May 1, 2008. Each quarter thereafter, Defendant shall submit a quarterly report, until such time as the compliance plan as been fully implemented and the source has returned to compliance, within 30 days of the end of the quarter.

5. Defendant shall continue to implement on an ongoing basis the steps it has already taken to achieve compliance, as set forth in Section I.D., Compliance Activities to Date, above, as well as to comply with any and all operations and maintenance plans or procedures that apply to the facilities and operations discussed in Section I.D., Compliance Activities to Date, above.

E. *Force Majeure*

1. *Force majeure* is an event arising solely beyond the control of the Defendant, which prevents the timely performance of any of the requirements of this Consent Order and shall include, but is not limited to, events such as floods, fires, tornadoes, other natural disasters, and labor disputes and unavailability of necessary equipment beyond the reasonable control of the Defendant. An increase in costs associated with implementing any requirement of this Consent Order shall not, by itself, excuse the Defendant for a failure to comply with such a requirement.

2. When a *force majeure* event occurs which causes or may cause a delay in the performance of any of the requirements of this Consent Order, the Defendant shall orally notify the Plaintiff within forty-eight (48) hours of the occurrence. Written notice shall be given to the Plaintiff as soon as practicable, but no later than ten (10) calendar days after the claimed occurrence. This section shall be of no effect as to the particular event involved if the Defendant fails to comply with these notice requirements.

3. Within ten (10) calendar days of receipt of any written *force majeure* notice, the Plaintiff shall respond in writing regarding the Defendant's claim of a delay or impediment to performance. If the Plaintiff agrees that the delay or impediment to performance has been or will be caused by circumstances beyond the control of the Defendant and that the Defendant could not have prevented the delay by the exercise of due diligence, the Plaintiff and Defendant shall stipulate to an extension of the required deadline(s) for all requirement(s) affected by the delay, by a period equivalent to the delay actually caused by such circumstances. Such stipulation may be filed as a modification to this Consent Order. The Defendant shall not be liable for stipulated penalties for the period of any such stipulated extension.

4. If the Plaintiff does not accept the Defendant's claim of a *force majeure* event, the Defendant must file a petition with the Court within twenty (20) calendar days of receipt of the Plaintiff's determination in order to contest the imposition of stipulated penalties. The Plaintiff shall have twenty (20) calendar days to file its response to said petition. The burden of proof of establishing that a *force majeure* event prevented the timely performance shall be upon the Defendant. If this Court determines that the delay or impediment to performance has been or will be caused by circumstances solely beyond the control of the Defendant and that the Defendant could not have prevented the delay by the exercise of due diligence, the Defendant shall be excused as to that event (including any imposition of stipulated penalties), for all requirements affected by the delay, for a period of time equivalent to the delay or such other period as may be determined by this Court.

F. Enforcement and Modification of Consent Order

1. This Consent Order is a binding and enforceable order of this Court. Except as set forth in Section III.J below, this Court shall retain jurisdiction of this matter and shall consider any motion by Plaintiff or Defendant, for the purposes of interpreting and enforcing the terms and conditions of this Consent Order.

2. The Plaintiff and the Defendant may, by mutual written consent, extend any compliance dates or modify the terms of this Consent Order without leave of this Court. A request for any modification shall be made in writing and submitted to the designated representatives. Any such request shall be made by separate document, and shall not be submitted within any other report or submittal required by this Consent Order. Any such agreed modification shall be in writing and signed by authorized representatives of the Plaintiff and the Defendant, for filing and incorporation by reference into this Consent Order.

G. Dispute Resolution

1. Except as provided herein, the Plaintiff and Defendant may seek to informally resolve disputes arising under this Consent Order, including but not limited to the Illinois EPA's decision regarding appropriate or necessary response activity, approval or denial of any report, plan or remediation objective, or the Plaintiff's rejection of a request for modification or termination of the Consent Order. The Plaintiff reserves the right to seek enforcement by the Court where the Defendant has failed to satisfy any compliance deadline within this Consent Order. The following are also not subject to the dispute resolution procedures provided by this section: a claim of *force majeure*, a failure to make any required payment and any circumstances posing a substantial danger to the environment or to the public health or welfare of persons.

2. The dispute resolution procedure must be invoked by a party through a written notice describing the nature of the dispute and the party's position with regard to such dispute. The other party shall acknowledge receipt of the notice and schedule a meeting to discuss the dispute informally not later than fourteen (14) calendar days from the receipt of such notice. These informal negotiations shall be concluded within thirty (30) calendar days from the date of the first meeting between the Plaintiff and Defendant, unless the Plaintiff and Defendant agree, in writing, to shorten or extend this period. The invocation of dispute resolution, in and of itself, shall not excuse compliance with any requirement, obligation or deadline contained herein, and stipulated penalties may be assessed for failure or noncompliance during the period of dispute resolution. As part of the resolution of any dispute, the Plaintiff and Defendant, by agreement or by order of this Court, may extend or modify the schedule for completion of work under this Consent Order to account for the delay in the work that occurred as a result of dispute resolution.

3. In the event that the Plaintiff and Defendant are unable to reach agreement during the informal negotiation period, the Plaintiff shall provide the Defendant with a written summary of its position regarding the dispute. The position advanced by the Plaintiff shall be considered binding unless, within twenty (20) calendar days of the Defendant's receipt of the written summary of the Plaintiff's position, the Defendant files a petition with this Court seeking judicial resolution of the dispute. The Plaintiff shall respond to the petition by filing the administrative record of the dispute and any argument responsive to the petition within twenty (20) calendar days of service of the Defendant's petition. The administrative record of the dispute shall include the written notice of the dispute, any responsive submittals, the Plaintiff's written summary of its position, the Defendant's petition before the court and the Plaintiff's response to the petition. The Plaintiff's position shall be affirmed unless, based upon the administrative record, it is against the manifest weight of the evidence.

H. Notice and Submittals

Except for payments, the submittal of any notice, reports or other documents required under this Consent Order, shall be delivered to the following designated representatives:

As to the Plaintiff

Kristen Laughridge Gale
Assistant Attorney General
Environmental Bureau
500 South Second Street
Springfield, IL 62706

Chris Pressnall
Division of Legal Counsel
Illinois EPA

Granite City, Illinois 62040

I. Release from Liability

In consideration of the Defendant's payment of a $300,000.00 penalty and upon completion of all activities required under Section III.D.2.a-d, 3, and 4. of this Consent Order,

the Plaintiff releases, waives and discharges the Defendant from any further liability or penalties for violations of the Act and state and federal regulations that were the subject matter of the Complaints herein. The release set forth above does not extend to any matters other than those expressly specified in the Plaintiff's Complaint filed on September 15, 2005, Plaintiff's First Supplemental Complaint filed on December 7, 2006, and Plaintiff's Second Supplemental Complaint filed on October 17, 2007. The Plaintiff reserves, and this Consent Order is without prejudice to, all rights of the State of Illinois against the Defendant with respect to all other matters, including but not limited to, the following:

a. criminal liability;

b. liability for future violations;

c. liability for natural resources damage arising out of the alleged violations; and

d. the Defendant's failure to satisfy the requirements of this Consent Order.

Nothing in this Consent Order is intended as a waiver, discharge, release, or covenant not to sue for any claim or cause of action, administrative or judicial, civil or criminal, past or future, in law or in equity, which the State of Illinois or the Illinois EPA may have against any person, as defined by Section 3.315 of the Act, 415 ILCS 5/3.315 (2006), other than the Defendant.

J. Termination

1. The Defendant may request that this Consent Order terminate no sooner than twelve (12) months after the Defendant has completed all actions required of the Defendant under Sections III.D.2.a-d, 3, and 4 of this Consent Order, provided that the Defendant has been in continuous compliance with the terms of the Consent Order for the twelve (12) months preceding the request; or after a Title V CAAPP permit is issued by the Illinois EPA to the Defendant, whichever date is later. Any such request must be made by notice to the Plaintiff and

include a statement that the Defendant has completed all actions required by Sections III.D.2.a-d, 3, and 4 of this Consent Order and has been in continuous compliance with the terms of the Consent Order for the twelve (12) months preceding the request and the following certification by a responsible corporate official of the Defendant:

> I certify under penalty of law that this statement was prepared under my direction or supervision, and that the information submitted in or accompanying this statement of final compliance is to the best of my knowledge true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and or imprisonment for knowing violations.

2. The Plaintiff shall notify the Defendant of its decision on the request within forty-five (45) calendar days of the Plaintiff's receipt of the request. If the Plaintiff agrees to terminate this Consent Order, the Plaintiff and the Defendant shall jointly file a notice with the Court that the Consent Order is terminated. If the Plaintiff does not agree to terminate this Consent Order, the Plaintiff shall provide the Defendant written notification stating the reasons why this Consent Order should not be terminated and the Defendant may then invoke the Dispute Resolution provisions. The Consent Order shall remain in effect pending resolution of any dispute between the Plaintiff and Defendant or the Court concerning whether the Defendant has completed its obligations under this Consent Order and is in compliance with the terms of the Consent Order. The provisions of Section III.I. shall survive and shall not be subject to and are not affected by the termination of any other provision of this Consent Order.

K. Execution and Entry of Consent Order

This Order shall become effective only when executed by the Plaintiff, the Defendant, and the Court. This Order may be executed by the Plaintiff, the Defendant, and the Court in one or more counterparts, all of which taken together, shall constitute one and the same instrument.

The undersigned representatives for the Plaintiff and the Defendant certify that they are fully authorized by the party whom they represent to enter into the terms and conditions of this Consent Order and to legally bind them to it.

WHEREFORE, the Plaintiff and the Defendant, by their representatives, enter into this Consent Order and submit it to this Court that it may be approved and entered.

TITLE V - CLEAN AIR ACT PERMIT PROGRAM (CAAPP) PERMIT
REVISED

PERMITTEE:

U. S. Steel Corporation
Granite City Works
Attn: Bryan Kresak
20th and State Streets
Granite City, Illinois 62040

I.D. No.: 119813AAI
Application No.: 96030056

Date Originally Received: March 6, 1996
Date Originally Issued: September 3, 2009
Date Revised Permit Issued: March 4, 2013
Expiration Date[1]: September 3, 2014

Operation of: Integrated Steel Mill
Source Location: 20th and State Streets, Granite City
Responsible Official: Richard E. Veitch, General Manager

This permit is hereby granted to the above-designated Permittee to OPERATE an Integrated Steel Mill Plant, pursuant to the above referenced permit application. This permit is subject to the conditions contained herein.

This permit was revised on March 4, 2013, in accordance with Sections 39.5(9)(e) through (g) of the Environmental Protection Act, pursuant to an order from Lisa P. Jackson, Administrator of the USEPA, *In the Matter of United States Steel Corporation – Granite City Works,* Petition Number V-2011-2 (December 3, 2012), which order was received by the Illinois EPA on December 4, 2012.

If you have any questions concerning this permit, please contact Anatoly Belogorsky or Michael Reed at 217/785-1705.

1.4 Source Description

Integrated steel manufacturing employing raw material processing/preparation, coke production, iron production, steel production, and steel finishing.

1.5 Title I Conditions

As generally identified below, this CAAPP permit contains certain conditions for emission units at this source that address the applicability of permitting programs for the construction and modification of sources, which programs were established pursuant to Title I of the Clean Air Act (CAA) and regulations thereunder. These programs include 40 CFR 52.21, Prevention of Significant Deterioration (PSD) and 35 IAC Part 203, Major Stationary Sources Construction and Modification (MSSCAM), and are implemented by the Illinois EPA pursuant to Sections 9, 9.1, 39(a) and 39.5(7)(a) of the Illinois Environmental Protection Act (Act). These conditions continue in effect,

notwithstanding the expiration date specified on the first page of this permit, as their authority derives from Titles I and V of the CAA, as well as Titles II and X of the Act. (See also Condition 8.7.)

a. This permit contains “Title I Conditions” that reflect Title I requirements established in permits previously issued for this source, which conditions are specifically designated as “T1”.

b. This permit contains Title I conditions that are newly established in this CAAPP permit, which conditions are specifically designated as “T1N”.

2.0 LIST OF ABBREVIATIONS AND ACRONYMS COMMONLY USED

ACMA	Alternative Compliance Market Account
Act	Illinois Environmental Protection Act [415 ILCS 5/1 et seq.]
AP-42	Compilation of Air Pollutant Emission Factors, Volume 1, Stationary Point and Other Sources (and Supplements A through F), USEPA, Office of Air Quality Planning and Standards, Research Triangle Park, NC 27711
ATU	Allotment Trading Unit
BACT	Best Available Control Technology
BAT	Best Available Technology
BFG	Blast Furnace Gas
BOF	Basic Oxygen Furnace
BOPF	Basic Oxygen Process Furnace
BTX	Benzene, toluene and xylene
CAA	Clean Air Act [42 U.S.C. Section 7401 et seq.]
CAAPP	Clean Air Act Permit Program
CAM	Compliance Assurance Monitoring
CEMS	Continuous Emission Monitoring System
CFR	Code of Federal Regulations
COG	Coke Oven Gas
COG-DS	Coke Oven Gas Desulfurization System
COMS	Continuous Opacity Monitoring System
CPMS	Continuous Parameters Monitoring System
dscf	Dry standard cubic feet
ERMS	Emissions Reduction Market System
ESP	Electro Static Precipitator
°F	Fahrenheit
FESOP	Federally Enforceable State Operating Permit
GHG	Greenhouse Gases
gr	grains
HAP	Hazardous Air Pollutant
HCL	Hydrogen Chloride
H_2S	Hydrogen Sulfate
IAC	Illinois Administrative Code
I.D. No.	Identification Number of Source, assigned by Illinois EPA
ILCS	Illinois Compiled Statutes
Illinois EPA	Illinois Environmental Protection Agency

LMF	Ladle Metallurgy Furnace
MACT	Maximum Achievable Control Technology
NESHAP	National Emission Standards for Hazardous Air Pollutants
NO_x	Nitrogen Oxides
NSPS	New Source Performance Standards
PM	Particulate Matter
PM_{10}	Particulate matter with an aerodynamic diameter less than or equal to a nominal 10 microns as measured by applicable test or monitoring methods

$PM_{2.5}$	Particulate matter with an aerodynamic diameter less than or equal to a nominal 2.5 microns as measured by applicable test or monitoring methods
ppm	Parts per million
PSD	Prevention of Significant Deterioration
RMP	Risk Management Plan
scf	Standard cubic feet
SO_2	Sulfur Dioxide
SSM	Startup, Shutdown and Malfunction
T1	Title I – identifies Title I conditions that have been carried over from an existing permit
T1N	Title I New – identifies Title I conditions that are being established in this permit
T1R	Title I Revised – identifies Title I conditions that have been carried over from an existing permit and subsequently revised in this permit
USEPA	United States Environmental Protection Agency
VHAP	Volatile Hazardous Air Pollutant
VOM	Volatile Organic Material

3.0 CONDITIONS FOR INSIGNIFICANT ACTIVITIES

3.1 Identification of Insignificant Activities

The following activities at the source constitute insignificant activities as specified in 35 IAC 201.210:

3.1.1 Activities determined by the Illinois EPA to be insignificant activities, pursuant to 35 IAC 201.210(a)(1) and 201.211, as follows:

a. Material Handling and Processing Operations

N/A

b. Coke Production

N/A

c. Coke Oven Gas By-Products Recovery Plant

Ammonium Sulfate Handling

d. Blast Furnaces

N/A

e. Basic Oxygen Furnaces

N/A

f. Continuous Casting

Tanks #543, #544, #545, #555

g. Finishing Operations

Scale Pits
#6 Zinc Pot (Backup)
#7 and #8 Zinc Pots
Storage Tanks ##306-310, #403, #427, #800, #815

h. Wastewater Treatment

N/A

i. Boiler Houses

N/A

3.1.2 Activities that are insignificant activities based upon maximum emissions, pursuant to 35 IAC 201.210(a)(2) or (a)(3), as follows:

a. Material Handling Operations

N/A

b. Coke Production

N/A

c. Coke Oven Gas By-Products Recovery Plant

Storage Tanks #116, #117, #118, #120

d. Blast Furnaces

Torpedo Car Dekishing

e. Basic Oxygen Furnaces

Lime/Magnesium Handling and Storage Unit

f. Continuous Casting

N/A

g. Finishing Operations

72″ Line and Cold Mill

h. Wastewater Treatment

N/A

i. Boiler Houses

N/A

3.1.3 Activities that are insignificant activities based upon their type or character, pursuant to 35 IAC 201.210(a)(4) through (18), as follows:

a. Material Handling Operations

Direct combustion units designed and used for comfort heating purposes and fuel combustion emission units as follows: (A) Units with a rated heat input capacity of less than 2.5 mmBtu/hr that fire only natural gas, propane, or liquefied petroleum gas; (B) Units with a rated heat input capacity of less than 1.0 mmBtu/hr that fire only oil or oil in combination with only natural gas, propane, or liquefied petroleum gas; and (C) Units with a rated heat input capacity of less than 200,000 Btu/hr which never burn refuse, or treated or chemically contaminated wood [35 IAC 201.210(a)(4)].

b. Coke Production

Direct combustion units designed and used for comfort heating purposes and fuel combustion emission units as follows: (A) Units with a rated heat input capacity of less than 2.5 mmBtu/hr that fire only natural gas, propane, or liquefied petroleum gas; (B) Units with a rated heat input capacity of less than 1.0 mmBtu/hr that fire only oil or oil in combination with only natural gas, propane, or liquefied petroleum gas; and (C) Units with a rated heat input capacity of less than 200,000 Btu/hr which never burn refuse, or treated or chemically contaminated wood [35 IAC 201.210(a)(4)].

Storage tanks of virgin or re-refined distillate oil, hydrocarbon condensate from natural gas pipeline or storage systems, lubricating oil, or residual fuel oils [35 IAC 201.210(a)(11)].

Storage tanks of any size containing exclusively soaps, detergents, surfactants, glycerin, waxes, vegetable oils, greases, animal fats, sweeteners, corn syrup, aqueous salt solutions, or aqueous caustic solutions, provided an organic solvent has not been mixed with such materials [35 IAC 201.210(a)(17)].

c. Coke Oven Gas By-Products Recovery Plant

Storage tanks of organic liquids with a capacity of less than 10,000 gallons and an annual throughput of less than 100,000 gallons, provided the storage tank is not used for the storage of gasoline or any material listed as a HAP pursuant to Section 112(b) of the CAA [35 IAC 201.210(a)(10)].

Storage tanks of virgin or re-refined distillate oil, hydrocarbon condensate from natural gas pipeline or storage systems, lubricating oil, or residual fuel oils [35 IAC 201.210(a)(11)].

Storage tanks of any size containing exclusively soaps, detergents, surfactants, glycerin, waxes, vegetable oils, greases, animal fats, sweeteners, corn syrup, aqueous salt solutions, or aqueous caustic solutions, provided an organic solvent has not been mixed with such materials [35 IAC 201.210(a)(17)].

d. Blast Furnaces

Direct combustion units designed and used for comfort heating purposes and fuel combustion emission units as follows: (A) Units with a rated heat input capacity of less than 2.5 mmBtu/hr that fire only natural gas, propane, or liquefied petroleum gas; (B) Units with a rated heat input capacity of less than 1.0 mmBtu/hr that fire only oil or oil in combination with only natural gas, propane, or liquefied petroleum gas; and (C) Units with a rated heat

input capacity of less than 200,000 Btu/hr which never burn refuse, or treated or chemically contaminated wood [35 IAC 201.210(a)(4)].

Storage tanks of virgin or re-refined distillate oil, hydrocarbon condensate from natural gas pipeline or storage systems, lubricating oil, or residual fuel oils [35 IAC 201.210(a)(11)].

e. Basic Oxygen Furnaces

Direct combustion units designed and used for comfort heating purposes and fuel combustion emission units as follows: (A) Units with a rated heat input capacity of less than 2.5 mmBtu/hr that fire only natural gas, propane, or liquefied petroleum gas; (B) Units with a rated heat input capacity of less than 1.0 mmBtu/hr that fire only oil or oil in combination with only natural gas, propane, or liquefied petroleum gas; and (C) Units with a rated heat input capacity of less than 200,000 Btu/hr which never burn refuse, or treated or chemically contaminated wood [35 IAC 201.210(a)(4)].

Storage tanks of organic liquids with a capacity of less than 10,000 gallons and an annual throughput of less than 100,000 gallons, provided the storage tank is not used for the storage of gasoline or any material listed as a HAP pursuant to Section 112(b) of the CAA [35 IAC 201.210(a)(10)].

f. Continuous Casting

Direct combustion units designed and used for comfort heating purposes and fuel combustion emission units as follows: (A) Units with a rated heat input capacity of less than 2.5 mmBtu/hr that fire only natural gas, propane, or liquefied petroleum gas; (B) Units with a rated heat input capacity of less than 1.0 mmBtu/hr that fire only oil or oil in combination with only natural gas, propane, or liquefied petroleum gas; and (C) Units with a rated heat input capacity of less than 200,000 Btu/hr which never burn refuse, or treated or chemically contaminated wood [35 IAC 201.210(a)(4)].

Storage tanks of organic liquids with a capacity of less than 10,000 gallons and an annual throughput of less than 100,000 gallons, provided the storage tank is not used for the storage of gasoline or any material listed as a HAP pursuant to Section 112(b) of the CAA [35 IAC 201.210(a)(10)].

Storage tanks of virgin or re-refined distillate oil, hydrocarbon condensate from natural gas pipeline or storage systems, lubricating oil, or residual fuel oils [35 IAC 201.210(a)(11)].

Storage tanks of any size containing exclusively soaps, detergents, surfactants, glycerin, waxes, vegetable oils, greases, animal fats, sweeteners, corn syrup, aqueous salt solutions, or aqueous caustic solutions, provided an organic solvent has not been mixed with such materials [35 IAC 201.210(a)(17)].

g. Finishing Operations

Direct combustion units designed and used for comfort heating purposes and fuel combustion emission units as follows: (A) Units with a rated heat input capacity of less than 2.5 mmBtu/hr that fire only natural gas, propane, or liquefied petroleum gas; (B) Units with a rated heat input capacity of less than 1.0 mmBtu/hr that fire only oil or oil in combination with only natural gas, propane, or liquefied petroleum gas; and (C) Units with a rated heat input capacity of less than 200,000 Btu/hr which never burn refuse, or treated or chemically contaminated wood [35 IAC 201.210(a)(4)].

Storage tanks of organic liquids with a capacity of less than 10,000 gallons and an annual throughput of less than 100,000 gallons, provided the storage tank is not used for the storage of gasoline or any material listed as a HAP pursuant to Section 112(b) of the CAA [35 IAC 201.210(a)(10)].

Storage tanks of virgin or re-refined distillate oil, hydrocarbon condensate from natural gas pipeline or storage systems, lubricating oil, or residual fuel oils [35 IAC 201.210(a)(11)].

Storage tanks of any size containing exclusively soaps, detergents, surfactants, glycerin, waxes, vegetable oils, greases, animal fats, sweeteners, corn syrup, aqueous salt solutions, or aqueous caustic solutions, provided an organic solvent has not been mixed with such materials [35 IAC 201.210(a)(17)].

h. Wastewater Treatment

Storage tanks of organic liquids with a capacity of less than 10,000 gallons and an annual throughput of less than 100,000 gallons, provided the storage tank is not used for the storage of gasoline or any material listed as a HAP pursuant to Section 112(b) of the CAA [35 IAC 201.210(a)(10)].

Storage tanks of virgin or re-refined distillate oil, hydrocarbon condensate from natural gas pipeline or storage systems, lubricating oil, or residual fuel oils [35 IAC 201.210(a)(11)].

Storage tanks of any size containing exclusively soaps, detergents, surfactants, glycerin, waxes, vegetable oils, greases, animal fats, sweeteners, corn syrup, aqueous salt solutions, or aqueous caustic solutions, provided an organic solvent has not been mixed with such materials [35 IAC 201.210(a)(17)].

i. Boiler Houses

Direct combustion units designed and used for comfort heating purposes and fuel combustion emission units as follows: (A) Units with a rated heat input capacity of less than 2.5 mmBtu/hr that fire only natural gas, propane, or liquefied petroleum gas; (B) Units with a rated heat input capacity of less than 1.0 mmBtu/hr that fire only oil or oil in combination with only natural gas, propane, or liquefied petroleum gas; and (C) Units with a rated heat input capacity of less than 200,000 Btu/hr which never burn refuse, or treated or chemically contaminated wood [35 IAC 201.210(a)(4)].

Storage tanks of organic liquids with a capacity of less than 10,000 gallons and an annual throughput of less than 100,000 gallons, provided the storage tank is not used for the storage of gasoline or any material listed as a HAP pursuant to Section 112(b) of the CAA [35 IAC 201.210(a)(10)].

Storage tanks of virgin or re-refined distillate oil, hydrocarbon condensate from natural gas pipeline or storage systems, lubricating oil, or residual fuel oils [35 IAC 201.210(a)(11)].

Gas turbines and stationary reciprocating internal combustion engines of less than 112 kW (150 horsepower) power output [35 IAC 201.210(a)(15)].

Storage tanks of any size containing exclusively soaps, detergents, surfactants, glycerin, waxes, vegetable oils, greases, animal fats, sweeteners, corn syrup, aqueous salt solutions, or aqueous caustic solutions, provided an organic solvent has not been mixed with such materials [35 IAC 201.210(a)(17)].

3.1.4 Activities that are considered insignificant activities pursuant to 35 IAC 201.210(b). Note: These activities are not required to be individually listed.

3.2 Compliance with Applicable Requirements

Insignificant activities are subject to applicable requirements notwithstanding status as insignificant activities. In particular, in addition to regulations of general applicability, such as 35 IAC 212.301 and 212.123 (Condition 5.3.2), the Permittee shall comply with the following requirements, as applicable:

3.2.1 For each particulate matter process emission unit, the Permittee shall comply with the applicable particulate matter emission limit of 35 IAC 212.321 or 212.322 (see Attachment 2) and 35 IAC Part 266. For example, the particulate matter emissions from a process emission unit shall not exceed 0.55 pounds per hour if the emission unit's process weight rate is 100 pounds per hour or less, pursuant to 35 IAC 266.110.

3.2.2 For each organic material emission unit that uses organic material, e.g., a mixer or printing line, the Permittee shall comply with the applicable VOM emission limit of 35 IAC 219.301, which requires that organic material emissions not exceed 8.0 pounds per hour or, if no odor nuisance exists, do not qualify as photochemically reactive material as defined in 35 IAC 211.4690.

3.2.3 For each cold cleaning degreaser, the Permittee shall comply with the applicable equipment and operating requirements of 35 IAC 219.182.

3.2.4 For each open burning activity, the Permittee shall comply with 35 IAC Part 237, including the requirement to obtain a permit for open burning in accordance with 35 IAC 237.201, if necessary.

3.2.5 For each storage tank that has a storage capacity greater than 946 liters (250 gallons) and, if no odor nuisance exists, that stores an organic material with a vapor pressure exceeding 2.5 psia, the Permittee shall comply with the applicable requirements of 35 IAC 219.122, which requires use of a permanent submerged loading pipe, submerged fill, a vapor recovery system, or an equivalent device approved by the Illinois EPA. [Note: storage tanks used for storing gasoline and any hazardous air pollutants are not eligible for insignificant activities].

3.2.6 For sulfuric acid operations and storage, the Permittee shall comply with the following emission limits of sulfuric acid and/or sulfur trioxide from all emission sources (with the exception of fuel combustion emission sources and acid manufacturing) at a plant or premises, pursuant to 35 IAC 214.303:

a. 45.4 grams in any one hour period for sulfuric acid usage less than 1180 Mg/yr (100 percent acid basis) (0.10 lbs/hr up to 1300 T/yr); and

b. 250 grams per metric ton of acid used for sulfuric acid usage greater than or equal to 1180 Mg/yr (100 percent acid basis) (0.50 lbs/T over 1300 T/yr).

3.3 Addition of Insignificant Activities

3.3.1 The Permittee is not required to notify the Illinois EPA of additional insignificant activities present at the source of a

type that is identified in Condition 3.1, until the renewal application for this permit is submitted, pursuant to 35 IAC 201.212(a).

3.3.2 The Permittee must notify the Illinois EPA of any proposed addition of a new insignificant activity of a type addressed by 35 IAC 201.210(a) and 201.211 other than those identified in Condition 3.1, pursuant to Section 39.5(12)(b) of the Act.

3.3.3 The Permittee is not required to notify the Illinois EPA of additional insignificant activities present at the source of a type identified in 35 IAC 201.210(b).

4.0 SUMMARY OF SIGNIFICANT EMISSION UNITS AT THIS SOURCE

Department	Description	Emission Control Equipment	Section
Material Handling and Processing Operations	Coal Crusher, Coal Pulverizer, Conveyors, Screens, Storage Bins, Feed Hoppers	Baghouse, Various Dust Collectors and Enclosures	7.1
Coke Production	Coke Oven Batteries “A” and “B” Coke Quenching	Water Scrubber; Flares Tower, Baffles	7.2
Coke By-Product Recovery Plant	Various Storage Tanks and Process Vessels	Vapor Recovery System and Various Blanketing and Negative Pressure Systems	7.3
COG Desulfurization System	Amine Unit and SRU Unit	Thermal Oxidizer	
COG System	Holding Tank and COG Flare	None	
Blast Furnaces	Blast Furnaces “A” and “B” BFG Flares #1 and #2	Casthouse Baghouse; Iron Spout Baghouse	7.4
Basic Oxygen Processes	BOF #1/#2 and Auxiliary Equipment	Electrostatic Precipitator; Baghouses	7.5
Continuous Casting	Continuous Casting and Slab Formation	None	7.6
Hot Strip Mill	Slab Reheat Furnaces	None	7.7
Finishing Operations	Pickling Line, Galvanizing Lines, Coating Operations	Fume Scrubbers; Catalytic Converter	7.8
Wastewater Treatment Plant	Various tanks, filtration and Lagoons	None	7.9
Boilers	Power Boiler #1 Boilers #11 and #12 Cooling Water Tower Portable Boilers #1 - #4	Flue Gas Recirculation (planned for Boilers #11 and #12)	7.10
Internal Combustion Engine	Emergency Engine-Generator	None	7.11
Gasoline Storage and Dispensing	Four Gasoline Storage Tanks and associated Dispensing Operations	None	7.12

Department	Description	Emission Control Equipment	Section
Fugitive Dust	Landfill Vehicular Traffic on Roadways, Parking Lots and Other Open Areas Storage Piles including truck unloading, wind erosion and material transfer from storage piles, beaching areas	None	7.13

5.0 OVERALL SOURCE CONDITIONS

5.1 Applicability of Clean Air Act Permit Program (CAAPP)

5.1.1 This permit is issued based on the source requiring a CAAPP permit as a major source of NO_x, PM_{10}, SO_2, VOM, CO, GHG and HAP emissions.

5.1.2 For purposes of the CAAPP, U.S. Steel is considered a single source with Stein Steel Mill Services (I.D. 119813AAD) located at 20th Street and Edwardsville in Granite City. Stein Steel Mill Services has a separate CAAPP permit for it operations.

5.1.3 For purposes of the CAAPP, U.S. Steel is considered a single source with Granite City Slag, LLC (I.D. 119040ATF) located at 20th Street and Edwardsville in Granite City. Granite City Slag has a separate CAAPP permit for it operations.

5.1.4 For purposes of the CAAPP, U.S. Steel is considered a single source with AKJ Industries, Inc (I.D. 119040AEB) located at 20th Street and Edwardsville in Granite City. AKJ Industries has a separate CAAPP permit for it operations.

5.1.5 For purposes of the CAAPP, U.S. Steel is considered a single source with Oil Technology, Inc (I.D. 119040ATG) located onsite of Granite City Steel (Route 203) in Granite City. Oil Technology has a separate CAAPP permit for it operations.

5.1.6 For purposes of the CAAPP, U.S. Steel is considered a single source with Tube City IMS (I.D.119040ATL) located at 2500 East 23rd Street in Granite City. Tube City has a separate CAAPP permit for it operations.

5.1.7 For purposes of the CAAPP, U.S. Steel is considered a single source with Gateway Energy & Coke Co LLC (I.D. 119040ATN) located at Edwardsville Road in Granite City. Gateway Energy & Coke has elected to obtain a separate CAAPP permit for its operations.

5.2 Area Designation

5.2.1 This permit is issued based on the source being located in an area that, as of the date of permit issuance, is designated nonattainment for the National Ambient Air Quality Standards for ozone (moderate nonattainment), $PM_{2.5}$ and lead, and attainment or unclassifiable for all other criteria pollutants (PM_{10}, CO, NO_x, SO_2).

5.3 Source-Wide Applicable Provisions and Regulations

5.3.1 Specific emission units at this source are subject to particular regulations as set forth in Section 7 (Unit-Specific Conditions for Specific Emission Units) of this permit.

5.3.2 Fugitive Dust

a. This source shall be operated under the provisions of Fugitive Particulate Matter Operating Program prepared by the Permittee and submitted to the Illinois EPA for its review. Such operating program shall be designed to significantly reduce fugitive particulate matter emissions [35 IAC 212.309(a)]. The Permittee shall comply with the fugitive particulate matter operating program and any amendments to the program submitted pursuant to Condition 5.3.2(b), as required by 35 IAC 212.309. As a minimum, the operating program shall include provisions identified in 35 IAC 212.310(a) through (g) and the following:

   i. A detailed description of the best management practices utilized to achieve compliance with 35 IAC 212.304 through 212.308.

   ii. Estimated frequency of application of dust suppressants by location; and

   iii. Such other information as may be necessary to facilitate the Illinois EPA's review of the operating program.

b. Pursuant to 35 IAC 212.312, the operating program shall be amended from time to time by the Permittee so that the operating program is current. Such amendments shall be consistent with the requirements set forth by this Condition 5.3.2 and shall be submitted to the Illinois EPA within 30 days of such amendment.

c. In addition to the items described above in Condition 5.3.2(a), the Permittee shall include the following additional plans and programs as part of the Fugitive Particulate Matter Operating Program:

   i. Housekeeping program for non-roadway areas as required by Condition 7.13.5(a)(i)(B);

   ii. Road Cleaning Program as required by Condition 7.13.5(d); and

   iii. On-site fugitive dust control program as referenced in Condition 7.13.9(b).

d. The revised Fugitive Particulate Matter Operating Program, submitted by the Permittee on August 12, 2009, (identified as Revision 8 and necessitated by changes to responsible officials and description of areas treated] and containing an attached Table and Map for the iron-making and steel-making roads respectively), is incorporated herein by reference. The document constitutes the formal operating program required under 35 IAC 212.310, addressing the control of fugitive particulate matter emissions from all plant roadways, including the iron-making and steel-making

roads, storage piles, access areas near storage piles, and other subject operations located at the facility that are subject to 35 IAC 212.309.

Any future revision to the aforementioned operating program made by the Permittee during the permit term is automatically incorporated by reference provided that said revision is not expressly disapproved, in writing, by the Illinois EPA within 30 days of receipt of said revision. In the event that the Illinois EPA notifies the Permittee of a deficiency with any revision to the operating program, the Permittee shall be required to revise and resubmit the operating program within 30 days of receipt of notification to address the deficiency [415 ILCS 39.5(7)(a)].

e. Pursuant to 35 IAC 212.301, the affected emission units at the source shall not cause or allow the emission of fugitive particulate matter from any process, including any material handling or storage activity, that is visible by an observer looking generally toward the zenith at a point beyond the property line of the source.

f. Pursuant to 35 IAC 212.307, all unloading and transporting operations of materials collected by pollution control equipment shall be enclosed or shall utilize spraying, pelletizing, screw conveying or other equivalent methods.

5.3.3 PM_{10} Contingency Measure Plan

a. This stationary source meets the criteria in 35 IAC 212.700 and is required to prepare and submit a contingency measure plan reflecting the PM_{10} emission reductions as set forth in 35 IAC 212.701 and 212.703.

b. PM_{10} Contingency Measure Plan shall be implemented by the Permittee in accordance with 35 IAC 212.704 upon notification from the Illinois EPA.

c. Pursuant to 35 IAC 212.701(c), for operational changes subject to Sections 212.304, 212.305, 212.306, 212.308, 212.316(a) through (e), 212.424 or 212.464 which require either a new permit or a revision to an existing permit the Permittee shall, within 30 days after such changes, submit a request to modify this CAAPP permit in order to include a new, appropriate contingency measure plan.

d. The plan, as submitted by the Permittee on November 15, 1994 (which includes tabulations of PM_{10} fugitive emissions, maps for the steel-works and iron making respectively, and a comparative analysis of contingency requirements and existing road programs), is incorporated herein by reference. The document constitutes the formal PM_{10} Contingency Measure Plan required by 35 IAC 212.701, addressing the Levels 1 and 2 control measures for reducing annual source-wide fugitive emissions of PM_{10} from plant

roads (paved and unpaved) and materials handling operations in the event of an exceedance of the 24-hour ambient air quality standard for PM10 under 35 IAC 212.704 or 212.705.

5.3.4 Ozone Depleting Substances

The Permittee shall comply with the standards for recycling and emissions reduction of ozone depleting substances pursuant to 40 CFR Part 82, Subpart F, except as provided for motor vehicle air conditioners in Subpart B of 40 CFR Part 82:

a. Persons opening appliances for maintenance, service, repair, or disposal must comply with the required practices pursuant to 40 CFR 82.156.

b. Equipment used during the maintenance, service, repair, or disposal of appliances must comply with the standards for recycling and recovery equipment pursuant to 40 CFR 82.158.

c. Persons performing maintenance, service, repair, or disposal of appliances must be certified by an approved technician certification program pursuant to 40 CFR 82.161.

5.3.5 Standards for Asbestos Demolition and Renovation (40 CFR 61.145)

a. Prior to demolition or renovation of the affected facility or part of the affected facility, the Permittee shall fulfill notification requirements established by 40 CFR 61.145(b).

b. During demolition or renovation, the Permittee shall comply with the procedures for asbestos emission control established by 40 CFR 61.145(c).

5.3.6 Future Emission Standards

Should this stationary source become subject to a regulation under 40 CFR Parts 60, 61, 62, or 63, or 35 IAC Subtitle B after the date this permit is issued, then the owner or operator shall, in accordance with the applicable regulation(s), comply with the applicable requirements by the date(s) specified and shall certify compliance with the applicable requirements of such regulation(s) as part of the annual compliance certification, as required by Condition 9.8. This permit may also have to be revised or reopened to address such new regulations (see Condition 9.12.2).

5.3.7 Episode Action Plan

a. Pursuant to 35 IAC 244.141, the Permittee shall maintain at the source and have on file with the Illinois EPA a written Episode Action Plan (plan) for reducing the levels of emissions during yellow alerts, red alerts, and emergencies, consistent with safe operating procedures.

b. The Permittee shall immediately implement the appropriate steps described in this plan should an air pollution alert or emergency be declared, as required by 35 IAC 244.169, or as may otherwise be required under 35 IAC 244, Appendix D.

c. If an operational change occurs at the source which invalidates the plan, a revised plan shall be submitted to the Illinois EPA for review within 30 days of the change, pursuant to 35 IAC 244.143(d). Such plans shall be further revised if disapproved by the Illinois EPA.

d. The revised plan, submitted by the Permittee on October 19, 2009, (which contains a completed APC Form 100 and attached Tables I-V identifying additional actions to be implemented), is incorporated herein by reference. The document constitutes the formal Episode Action Plan required by 35 IAC 244.142, addressing the actions that will be implemented to reduce SO_2, PM_{10}, NO_2, CO and VOM emissions from various emissions units in the event of a yellow alert, red alert or emergency issued under 35 IAC 244.161-244.165.

Any future revision to the aforementioned plan made by the Permittee during the permit term is automatically incorporated by reference provided that said revision is not expressly disapproved, in writing, by the Illinois EPA within 30 days of receipt of said revision. In the event that the Illinois EPA notifies the Permittee of a deficiency with any revision to the plan, the Permittee shall be required to revise and resubmit the plan within 30 days of receipt of notification to address the deficiency [415 ILCS 39.5(7)(a)].

5.3.8 Risk Management Plan (RMP)

Should this stationary source, as defined in 40 CFR 68.3, become subject to the federal regulations for Chemical Accident Prevention in 40 CFR Part 68, then the owner or operator shall submit the items below. This condition is imposed in this permit pursuant to 40 CFR 68.215(a)(2)(i) and (ii).

a. A compliance schedule for meeting the requirements of 40 CFR Part 68 by the date provided in 40 CFR 68.10(a); or

b. A certification statement that the source is in compliance with all requirements of 40 CFR Part 68, including the registration and submission of the RMP, as part of the annual compliance certification required by Condition 9.8.

5.3.9 Energy Assessment (40 CFR 63, Subpart DDDDD)

Pursuant to 40 CFR 63.7500(a)(1) and Item 3 of Table 3 of 40 CFR 63 Subpart DDDDD, the Permittee must have a one-time energy assessment performed on the major source facility (i.e., the facility) by a qualified energy assessor. This energy

assessment shall be completed no later than the applicable compliance date of this NESHAP for existing sources and meet requirements in Table 3, including preparation of a comprehensive report detailing the ways to improve efficiency, the cost of specific improvements, benefits, and the time frame for recouping those investments. This energy assessment shall be conducted consistent with the definitions for “energy assessment”, “energy management practices” and “energy use system” in 40 CFR 63.7575

5.4 Source-Wide Non-Applicability of Regulations of Concern

a. Except where noted, 35 IAC 212.321 and 212.322 shall not apply to the steel manufacturing processes subject to 35 IAC 212.442 through 212.452 [35 IAC 212.441].

b. Except where noted, emission limitations of 35 IAC 212.324 are not applicable to any emission unit subject to a specific emissions standard or limitation contained in 35 IAC Subpart R, Primary and Fabricated Metal Products and Machinery Manufacture pursuant to 35 IAC 212.324(a)(3)(C).

c. This source (as a source of coke manufacturing, by-products recovery plant, iron and steel production) is excluded from the control requirements of 35 IAC Part 219 Subpart TT pursuant to 35 IAC 219.980(e).

d. This source does not receive any off-site waste as defined in 40 CFR 63.680(b) and, therefore is not subject to 40 CFR Part 63 Subpart DD “Off-site Waste and Recovery Operations”.

e. The source is not required to address 40 CFR Part 64, Compliance Assurance Monitoring (CAM) for Major Stationary Sources at the time of issuance of this permit, because the initial CAAPP application was submitted prior to April 1998 [40 CFR 64.5(a)(1)].

5.5 Source-Wide Control Requirements and Work Practices

The Permittee (U.S. Steel), in conjunction with Gateway Energy and Coke Company shall maintain 267.77 tons of PM_{10} emission offsets generated by the following activities/projects (see also Sections 7.3 and 7.13):

Activity/Project	(Tons/Year)
Coke Oven Gas (COG) Desulfurization Project	31.74
Road Cleaning Program	236.03
Total:	267.77

a. These emission reductions have been relied upon by the Illinois EPA to issue Construction Permits 06070088 and 06070020 for projects by the Permittee and Gateway, respectively and cannot be used as emission reduction credits for other purposes.

b. If the Permittee proposes to rely upon emission offsets from other sources or other activities/projects, the Permittee shall

apply for and obtain a revision to Permit 06070088 prior to relying on such emission offsets, which application shall be accompanied by detailed documentation for the nature and amount of those alternative emission offsets.

5.6 Source-Wide Production and Emission Limitations

5.6.1 Emissions of Hazardous Air Pollutants

Source-wide emission limitations for HAPs as listed in Section 112(b) of the CAA are not set. This source is considered to be a major source of HAPs.

5.6.2 Other Source-Wide Production and Emission Limitations from existing permits:

a. Provisions from Construction Permit #95010001

i. Total production of iron and steel by U.S. Steel/Granite City plant shall not exceed the following limits. Compliance with these annual production limits shall be determined on a month by month basis by showing that the actual production of iron and steel from the plant did not exceed the scheduled rate of production for a month given in the most recent production schedule provided to the Illinois EPA Compliance Section and Collinsville Regional Office as provided below [T1]:

Product	Net tons/yr
Iron	3,165,000
Steel	3,580,000

A. If no production schedule is submitted to the Illinois EPA by the Permittee for a particular year, the scheduled monthly production of iron and steel shall be set at one twelfth of the annual production limits in Condition 5.6.2(a)(i) above.

B. 1. The Permittee may submit a schedule for iron and steel production for each month of the calendar year. Such schedule shall provide the scheduled monthly iron and steel production for each month and the total of such scheduled production shall not exceed the annual production limits in Condition 5.6.2(a)(i) above. This schedule shall be submitted each year no later than December 15th of the preceding year.

2. During the course of the year, the Permittee may submit a revised production

schedule which accounts for actual production levels which were below that scheduled for the previous months, provided that in no case shall the scheduled production for prior months in such a revised schedule be lowered to less than actual production levels or raised. Such revised schedule shall be submitted no later than 15 days after the first day of the month for which scheduled production has been raised. Such schedule shall be accompanied by data on actual production in preceding months.

ii. Total fuel usage for blast furnaces stoves (A and B), boilers 11 and 12, ladle drying preheaters and blast furnace gas flare #1 and shall not exceed the following limits. Compliance with the monthly limits shall be determined by direct comparison of monthly data to the applicable limit. Compliance with the annual limits shall be determined based on a calendar year [T1]:

A. Natural Gas usage:

225 million ft^3 per month and 1,346 million ft^3 per year;

B. Blast Furnace Gas (BFG) usage:

30,800 million ft^3 per month and 185,030 million ft^3 per year; and

C. Fuel Oil usage:

60,000 gallons per month and 365,000 gallons per year.

iii. A. Annual emissions from the fuel combustion units identified in Condition 5.6.2(a)(ii) above shall not exceed the following limits in tons/year:

PM/PM_{10}	SO_2*	NO_x	VOM	CO	Lead
274	641	706	2	1,295	0.06

* These limits have been addressed by an enforcement action, with a compliance schedule established for compliance with these limits. (See Condition 7.4.13)

B. Annual emissions from each individual fuel used in the fuel combustion units identified in

Condition 5.6.2(a)(ii) above shall not exceed the following limits:

1. Natural Gas

Pollutant	Emission Factor (Lbs/mmcf)	Maximum Emissions (Tons/Yr)
PM	5.1	3.43
PM_{10}	5.1	3.43
SO_2	0.6	0.40
NO_x	306.0	205.94
VOM	2.8	1.88
CO	40.0	26.92

2. BFG

Pollutant	Emission Factor (Lbs/mmcf)	Maximum Emissions (Tons/Yr)
PM	2.90	268.29
PM_{10}	2.90	268.29
SO_2	6.65*	615.22*
NO_x	5.28	488.48
CO	13.70	1,267.46

* These limits have been addressed by an enforcement action, with a compliance schedule established for compliance with these factors and limits. (See Condition 7.4.13)

3. Fuel Oil

Pollutant	Emission Factor (Lbs/Mgal)	Maximum Emissions (Tons/Yr)
PM	9.72	1.77
PM_{10}	9.75	1.77
SO_2	141.30	25.79
NO_x	55.00	10.04
VOM	0.28	0.05
CO	5.00	0.91
Lead	0.336	0.06 (Waste Oil)

C. Compliance with the annual limits in Condition 5.6.2(a)(iii) shall be determined based on a calendar year.

b. Provisions from Construction Permit #06070022:

Annual emissions of the source from combustion of COG shall not exceed the following limits [T1)]

	Limits (Tons/Year)	
	PM_{10}	SO_2
"Outage" of Affected System	47.55	530.59
Total (includes normal and outage):	224.80	807.90

c. Provisions from FESOP #94120017:

Emissions of SO_2 from the so called "sulfur dioxide emission units" operated at the source shall not exceed the following limits. Compliance with the limits shall be determined in accordance with the procedure in Condition 5.12.

Unit Operating Group	Sulfur Dioxide Emissions		
	(Lbs/3-Hours)	(Lbs/Day)	(Tons/Yr)
Slab Reheat Furnaces 1-3	2,299	9,754	987
Slab Reheat Furnace 4	---	11,873	1,204
Blast Furnace Stoves A and B	---	19,774	3,609
Boilers 11 and 12	---	20,584	3,756
Ladle Drying Preheaters	555	2,786	509
Blast Furnace Casthouse Baghouse	---	3,430	626
Iron Spout Baghouse	---	170	31

5.7 Source-Wide Testing Requirements

Pursuant to 35 IAC 201.282 and Section 4(b) of the Act, every emission source or air pollution control equipment shall be subject to the following testing requirements for the purpose of determining the nature and quantities of specified air contaminant emissions and for the purpose of determining ground level and ambient air concentrations of such air contaminants:

a. Testing by Owner or Operator: The Illinois EPA may require the owner or operator of the emission source or air pollution control equipment to conduct such tests in accordance with procedures adopted by the Illinois EPA, at such reasonable times as may be specified by the Illinois EPA and at the expense of the owner or operator of the emission source or air pollution control equipment. All such tests shall be made by or under the direction of a person qualified by training and/or experience in the field of air pollution testing. The Illinois EPA shall have the right to observe all aspects of such tests [35 IAC 201.282(a)].

b. Testing by the Illinois EPA: The Illinois EPA shall have the right to conduct such tests at any time at its own expense. Upon request of the Illinois EPA, the owner or operator of the emission source or air pollution control equipment shall provide, without charge to the Illinois EPA, necessary holes in stacks or ducts and other safe and proper testing facilities, including scaffolding, but excluding instruments and sensing devices, as may be necessary [35 IAC 201.282(b)].

c. Any such tests are also subject to the Testing Procedures of Condition 8.5 set forth in the General Permit Conditions of Section 8.

5.8 Source-Wide Monitoring Requirements

a. Requirements for coke oven gas (COG) flow meters from FESOP #94120017: for purposes of these conditions, a Unit Operating Group is a group of emission units as defined in Condition 5.6.2(c).

Note: Requirements for monitoring the sulfur content of COG as present in FESOP #94120017 are included in Section 7.3 of this CAAPP permit.

i. The Permittee shall test, operate, and maintain a system for measuring the COG usage for each unit operating group.

ii. A flow meter shall be maintained on the main Blast Furnace and Steelworks COG feed lines and each individual emission unit or unit operating group and shall be used to measure the COG usage rate. The total COG usage for each unit operating group as a whole shall be the sum of the individual usage for the emission units of that group as measured by the individual meters or that measured by a single flow meter measuring the COG usage for the unit operating group as a whole.

iii. The COG flow meter system shall be capable of recording the COG usage in standard cubic feet on an hourly and daily basis. COG usage shall be obtained from the COG flow meter system to allow the determination of hourly and/or daily COG usage for each unit operating group, as needed for the emission rate calculations of this permit.

iv. The COG flow meter system shall be operated, and data collected, reduced and maintained, in accordance with the applicable requirements of 40 CFR 60.13 and 35 Ill. Adm. Code Part 201 Subpart L.

A. Each COG flow meter shall be tested at least every 12 months, in accordance with the procedures of 40 CFR 60, Appendix B, Performance Specification 6.

B. The results of these flow meter performance tests shall be sent to the Illinois EPA's Division of Air Pollution Control, Permit Section and Regional Office within 14 days after completion of the tests. In addition, the results shall be maintained in accordance with the recordkeeping requirements specified in this permit.

C. If a single flow meter on an unit operating group fails, then the COG usage for that group may be calculated using the difference between overall total COG usage and the total COG usage at the remaining properly operating COG flow meters, or the difference in COG usage from the main COG feed line of the affected unit operating group and the COG usage at the remaining properly operating flow meters associated with that main feed line.

D. In the event that several flow meters are down such that the above COG usage calculation is not possible, the COG usage for the affected unit operating group(s) shall be determined by a method approved by the Illinois EPA (e.g., use of temporary backup measurement system). In no case shall COG usage not be determined by a method described in this permit, or an approved alternative method, so as to result in insufficient data being obtained to determine the COG usage for any unit operating group as needed to evaluate compliance using the emission rate calculations of this permit.

v. In the event of malfunction or breakdown of a COG flow meter system, the Permittee shall repair and recalibrate the meter or monitoring system as soon as practicable but no later than 10 days after the malfunction or breakdown is detected, unless prior Illinois EPA approval is obtained by submitting a notification of extended outage and adequate justification to the Illinois EPA detailing the reasons for delay. Records of repair and recalibration must be maintained in accordance with the recordkeeping requirements of this CAAPP permit. This condition does not relieve the Permittee of the minimum data obtaining requirements of this CAAPP permit.

b. The Permittee shall conduct observations at the property line of the source for visible emissions of fugitive particular matter form the source to address compliance with 35 IAC 212.301, upon request by the Illinois EPA, as follows:

For this purpose, daily observations shall be conducted for a week for particular area(s) of concern at the source, as specified in the request. Observations shall begin either within one day or three days of receipt of a written request

from the Illinois EPA, depending, respectively, upon whether observations will be conducted by employees of the Permittee or a third-party observer hired by the Permittee to conduct observations on its behalf. The Permittee shall keep records for these observations, including identity of the observer, the date and time of observations, the location(s) from which observations were made, and duration of any fugitive emissions event(s).

c. Pursuant to FESOP 94120017, the Permittee shall analyze the fuel oil used at the source in accordance with the following.

i. The sulfur content and density as determined by the ASTM methods specified in the testing requirements of FESOP 94120017 shall be used in emission calculations.

ii. The sulfur content and density of the fuel oil shall be determined upon each instance of fuel oil usage.

5.9 Source-Wide Recordkeeping Requirements

5.9.1 Records for Opacity and Emission Limits

The Permittee shall maintain the following records pursuant to Section 39.5(7)(b) of the Act:

a. The Permittee shall maintain records of the total annual net production of iron and steel on a monthly basis and a total calendar year basis, to verify compliance with Condition 5.6.2(a)(i).

b. The Permittee shall maintain records of monthly and annual use of fuels to verify compliance with Condition 5.6.2(a)(ii).

c. The Permittee shall maintain records of annual emissions from the emission units listed in Condition 5.6.2(a)(ii) for comparison to the annual emission limits in Condition 5.6.2(a)(iii)(A) for PM/PM_{10}, SO_2, NO_x, VOM, CO and lead.

d. The Permittee shall maintain the following records for the emission units identified in Condition 5.6.2(a)(ii) to verify the emission factors for different fuels listed in Condition 5.6.2(a)(iii)(B):

i. For emissions of NO_x, PM, PM_{10}, VOM, and CO, records for the emission factors used by the Permittee to determine emissions of the pollutant from the subject emission units for firing of natural gas, blast furnace gas and oil, with supporting documentation and analysis, and the “maximum” annual emission factors for the different fuels and pollutants calculated as a weighted average of the individual

factors for different emission units, weighted for the greatest relative annual use of fuel in different units, beginning with the unit that has the highest emission factor. For example, if the boilers have the highest emission factors for NO_x, the factors shall be weighted for the greatest percentage of fuels expected to be used in the boilers, and then for the units that have the next highest emission factor(s), and so forth until all of the fuel has been accounted for. These records shall be reviewed and updated by the Permittee as necessary to assure that the emission factors that it uses to determine emissions of the subject unit do not understate emissions, including review when emission testing is conducted for the subject emission units, review when emission testing of similar emission units is conducted at other facilities (as would be needed if the Permittee is relying upon data from emission testing at other US Steel facilities), and review when USEPA revises its *Compilation of Air Pollutant Emission Factors*, AP-42 (as would be needed if the Permittee has relied upon emission factors from AP-42). These records shall be prepared and copies submitted to the Illinois EPA in accordance with Condition 5.9.6(c).

ii. Records for the sulfur content of COG and BFG, as measured pursuant to Conditions 5.9.1(e) and 7.3.9(f) and Condition 7.10.8-1(c), respectively, which data shall either be used when determined SO_2 emissions from combustion of the fuels or used to confirm that the determinations of SO_2 emissions from combustion of these fuels do not understate actual SO_2 emissions.

iii. Records for the actual average annual emission rates for different fuels and pollutants, including SO_2 and lead, calculated by dividing the actual emissions of the subject units for different fuels and pollutants by the annual usage of fuels. These records shall be compiled on an annual basis by the Permittee when the records for annual emissions of the subject units are compiled.

e. The Permittee shall maintain the following records for the emissions of PM_{10}* and SO2 associated with use of COG to verify compliance with the emission limits in Condition 5.6.2(b). (See also recordkeeping requirements in Section 7.3 of the permit.)

* For the purpose of this condition, the Permittee shall address total PM_{10}, including both filterable and condensable particulate, rather than only filterable particulate.

i. Records for the volumes of COG that are and are not processed by the COG Desulfurization System (scf), with data for undesulfurized COG on a 3-hour, daily and monthly basis and data for desulfurized COG on a daily and monthly basis.

ii. Records for the sulfur contents of COG (gr/scf or gr/100 scf), with data for undesulfurized COG on a 3-hour, daily and monthly basis and data for desulfurized COG on a daily and monthly basis.

iii. Records for the emission factors used by the Permittee to determine the PM_{10} emissions from firing desulfurized and undesulfurized COG for the emission units at the facility that fire COG, with supporting documentation and analysis, and the “maximum” annual PM_{10} emission factor calculated as a weighted average of the individual factors for different emission units, weighted for the greatest relative annual use of COG in different units, beginning with the unit that has the highest emission factor. These records shall be reviewed and updated by the Permittee as necessary to assure that the emission factors that it uses to determine emissions of units firing COG do not understate emissions, including review when PM_{10} emission testing is conducted for units at the facility and review when PM_{10} emission testing of similar emission units is conducted at other facility.

iv. Records for the annual PM_{10} and SO_2 emissions from the facility from combustion of COG that has not been desulfurized, determined from the summation of the volume of such COG multiplied by either its sulfur content or the established PM10 emission factor for undesulfurized COG.

v. Records for the annual PM_{10} and SO_2 emissions from the facility from combustion of COG that has been desulfurized, determined from the summation of the volume of such COG multiplied by either its sulfur content or the established PM10 emission factor for desulfurized COG.

vi. Records for the total annual PM_{10} and SO_2 emissions from the facility from combustion of COG, determined as the sum of the annual emission from combustion of COG that has and has not been desulfurized.

5.9.2 Records for HAP Emissions

The Permittee shall maintain source-wide records of HAP emissions on a calendar year basis and individually for the emission units or group of emission units covered by Section 7 (Unit Specific Conditions for Specific Emission Units) of this

permit and emitting HAPs, pursuant to Section 39.5(7)(b) of the Act.

5.9.3 Records for Source-Wide Control Requirements and Work Practices

a. The Permittee shall keep a copy of the fugitive particulate matter operating plan, and any amendments or revisions to the plan, as required by Condition 5.3.2. The Permittee shall also keep a record of activities completed according to the plan.

b. The Permittee shall keep copy of the PM_{10} contingency plan, and any amendments or revisions as described by Condition 5.3.3. The Permittee shall also keep a record of activities completed according to the plan.

c. The Permittee shall keep a copy of the Episode Action Plan, and any amendments or revisions to the plan, as described in Condition 5.3.7. The Permittee shall also keep a record of activities completed according to the plan.

d. The Permittee shall keep a record of property line observations required by Condition 5.8(b).

5.9.4 Records to address SO_2 emission limits in Condition 5.6.2(c) from FESOP #94120017:

a. SO_2 emissions of each unit operating group in terms of the associated emission limits of this permit (i.e., lbs/3-hrs and lbs/day) accompanied by the data from which they were determined.

b. SO_2 emissions of each unit operating group in tons/month.

c. SO_2 emissions of each unit operating group in tons/year determined by using a rolling total of the previous 12 consecutive months of data.

d. Records for repairs of any COG flow meter, as required by Condition 5.8(a)(v), including copies of any notifications to the Illinois EPA for extended outage of a flow meter.

e. Records for any fuel oil usage instances with the results of the sampling and analysis of oil sulfur content.

5.9.5 The Permittee shall retain copies of all emission test reports and other test reports and other submittals to the Illinois EPA related to testing that are required by Conditions 5.7 and 5.10 and other conditions of this permit.

5.9.6 Retention, Availability and Submittal of Records

Pursuant to Section 39.5(7)(e)(ii) of the Act, the Permittee shall keep the records required by this permit as follows:

a. All records and logs required by this permit shall be retained for at least five years from the date of entry (unless a longer retention period is specified by the particular recordkeeping provision herein). The Permittee shall keep the last 3 years of data on-site and remaining 2 years data may be kept at an offsite location. The Permittee shall make all these readily accessible records available to the Illinois EPA or USEPA for inspection and/or copying upon request.

b. The Permittee shall retrieve and print, on paper during normal source office hours, any records retained in an electronic format (e.g., computer) in response to an Illinois EPA or USEPA request for records during the course of a source inspection.

c. For certain records related to emission factors or emission rates required to be kept by this permit for various emission units at this source, as specifically identified in other conditions of this permit, the Permittee shall submit a copy of the records to the Illinois EPA as provided below:

i. Copies of initial records shall be submitted to the Illinois EPA within 15 days of the date that the Permittee prepares these records for subject unit(s), which shall in no case be later than January 20, 2012.

ii. Thereafter, copies of revised records shall be submitted to the Illinois EPA with the emission test reports for subject emission unit(s) if the records were revised as a consequence of emission testing or otherwise within 15 days of the date that the Permittee completes the preparation of revised records for subject unit(s).

5.9.7 Inspection, Sampling and Observations Documentation

Inspection, sampling and observation performed as required by this permit shall have documentation in addition to the records elsewhere in this permit that identifies at least the following:

a. Name of person(s) or representative performing such activity;

b. Date and time of such activity;

c. Any applicable industry standards or other specific procedures for such activities; and

d. Any quality assurance or quality control results.

5.10 Source-Wide Reporting Requirements

5.10.1 General Source-Wide Reporting Requirements

a. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations from applicable requirements as follows:

i. Requirements in Condition 5.3.2(d) and (e)

ii. Requirements in Condition 5.5.

iii. Requirements in Condition 5.6.2.

b. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

c. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by in Condition 8.6.1.

d. All required deviation reports described in Condition 5.10.1 above shall contain the following information:

i. Date and time of the deviation;

ii. Emission units(s)/operation involved;

iii. The duration of the event;

iv. Probable cause of the deviation;

v. Any corrective actions or preventative measures taken;

vi. Reporting on malfunction and breakdown shall be performed in accordance with Condition 5.10.5; and

vii. Reporting on startup shall be performed in accordance with Condition 5.10.5.

5.10.2 Annual Emissions Report

a. The annual emissions report required pursuant to Condition 9.7 shall contain emissions information, including HAP emissions, for the previous calendar year.

b. The Permittee shall submit the following additional information from the prior calendar year with the Annual Emissions Report, due May 1st of each year, pursuant to Permit 95010001:

i. Iron and steel production (tons/month and tons/yr, each);

ii. Natural gas and BFG usage ($mmft^3$/month and $mmft^3$/yr, each); and

iii. Fuel oil usage (thousand gallons/month and thousand gallons/yr, for each type of oil).

c. The Permittee shall submit an annual report to the Illinois EPA with its Annual Emission Report describing the implementation of the Road Cleaning Program for the affected road segments, as defined in Condition 7.13.5(d), during the previous year. This report shall at a minimum provide: the number of times each road segment was cleaned; the number of times that scheduled cleaning was not performed, with explanation; a description of any significant changes in road cleaning equipment or cleaning practices, with explanation; and a description of other significant changes to the Program, including changes in contractors [Permit #06070088].

5.10.3 Reporting requirements from FESOP #94120017

a. The Permittee shall submit quarterly reports (every 3 calendar months) to the Illinois EPA. This report is due 30 days after the end of the reporting period and may be submitted on computer disk. This report shall contain the following information for the days during the quarter:

i. A summary showing the emissions of SO_2 for each unit operating group for each day and the 12 month rolling average in tons/year.

ii. A statement identifying any apparent violations which occurred during the quarter covered by the report or, if there have been no apparent violations, a statement to that effect.

iii. A summary of any COG flow meter downtime.

iv. Identification of any days for which data for at least 75% of the operating hours of the unit operating group was not obtained by an approved method; justification for not obtaining the data; and description of corrective action taken.

b. These reports shall be sent to IEPA Compliance Section in Springfield and IEPA Regional Office in Collinsville.

c. Copies of the Final Report for the tests identified in Condition 5.8(a)(iv) shall be submitted to the Illinois EPA along with the quarterly reports required by this CAAPP permit within 30 days after the reported quarter.

5.10.4 Other Source-Wide Reporting Requirements

a. i. A quarterly report shall be submitted to the Illinois EPA stating the following: the dates any necessary control measures were not implemented, a listing of those control measures, the reasons that the control measures were not implemented, and any corrective actions taken. This information includes, but is not limited to, those dates when controls were not applied based on a belief that application of such control measures would have been unreasonable given prevailing atmospheric conditions, which shall constitute a defense to the requirements of this Section. This report shall be submitted to the Illinois EPA thirty (30) calendar days from the end of a quarter. Quarters end March 31, June 30, September 30, and December 31 [35 IAC 212.316(g)(5)].

ii. The reporting requirements from the above are established for fugitive particulate matter control measures implemented for the certain operations identified in 35 IAC 212.316(b) through 212.316(f).

iii. Control measures for this condition are those identified in the Fugitive Particulate Matter Operating Program.

b. Upon written request by the Illinois EPA, a report shall be submitted to the Illinois EPA for any period specified in the request stating the following: the dates during which any process emission unit was in operation when the air pollution control equipment was not in operation or was not operating properly, documentation of causes for pollution control equipment not operating or not operating properly, and a statement of what corrective actions were taken and what repairs were made [35 IAC 212.324(g)(6)].

5.10.5-1 Reporting for Startups (State Authorization)

Pursuant to 39.5(7)(a) and (f)(ii) of the Act, when startup reports are required for an emission unit by unit specific conditions in Chapter 7 of this permit, such reports shall be submitted to the Illinois EPA, Air Compliance Section and Collinsville Regional Field Office on a semi-annual basis, and include the following information related to startups of such emission unit and associated air pollution control equipment.

a. If startups occurred during the reporting period, the report shall include the following:

i. The number of startups.

ii. The number of departures from established procedures.

iii. The number of exceedances of each applicable standard.

iv. A general explanation for the magnitude of the numbers reported and the significance or meaning of those numbers.

v. A general explanation for the departures.

vi. A general explanation for the exceedances.

vii. A general discussion of whether any improvements were made to startup practices

b. If there were no startups for the reporting period, a statement that “No startups occurred during this reporting period.”

c. Startups that resulted in excess emissions shall be addressed in the deviation reports as required by unit specific conditions in Chapter 7 of this permit.

5.10.5-2 Reporting for Malfunction or Breakdown (State Authorization)

a. The Permittee shall provide the following notification and reports to the Illinois EPA, Air Compliance Section and Collinsville Regional Field Office, pursuant to 35 IAC 201.263, concerning continued operation of an affected emission unit or related air pollution control equipment when such continued operation would cause a violation of a standard or limitation in 35 IAC Subtitle B, Chapter I, subchapter c:

i. If an emission unit or control device operates during a malfunction/breakdown, the Permittee shall immediately report such event to the Illinois EPA within 2 working days after such event occurs. The immediate notification shall be provided to the Illinois EPA’s Springfield Office (Compliance Section) by a telephone, facsimile, electronic mail or other alternative method of correspondence that constitutes the fastest available alternative. The immediate notification shall be followed by a letter to the Illinois EPA’s Springfield Office (Compliance Section), postmarked within 7 working days after the end of the event. The 7 day follow-up letter shall contain the name, title, and signature of the owner or operator or other responsible official certifying its accuracy, explaining the circumstances and reasons for event, describing all excess emissions and/or parameter monitoring exceedances which may have occurred during the malfunction/breakdown event, actions taken to minimize emissions or parameter exceedance and all repairs made in conjunction with such malfunction/breakdown event.

ii. If all the necessary information identified above is contained within the 2-day immediate notification and the notification was done by means of written correspondence, a 7-day follow-up letter is not required to be submitted.

iii. A summary of these malfunction/breakdown reports required by this permit shall be submitted to the Illinois EPA's Springfield Office Compliance Section on a quarterly basis and contain the following:

A. Date and time of malfunction/breakdown;

B. Emission unit(s)/control involved;

C. The duration of the event;

D. Probable cause of malfunction/breakdown; and

E. Repairs and other corrective actions taken.

5.10.5-3 Federal Startup Shutdown and Malfunction/Breakdown Requirements

a. For those emission units subject to a NESHAP standard and for which an SSM plan is required under 40 CFR 63.10(d)(5), the Permittee shall submit reports as required by the NESHAP including:

i. Periodic startup, shutdown or malfunction reports [40 CFR 63.10(d)(5)(i)]

A. 1. If actions taken by an owner or operator during a startup or shutdown (and the startup or shutdown causes the affected emission unit to exceed any applicable emission limitation in the relevant NESHAP emission standards specified in Section 7 of this permit), or malfunction of an affected emission unit (including actions taken to correct a malfunction) are consistent with the procedures specified in the source's startup, shutdown, and malfunction plan (see 40 CFR 63.6(e)(3)), the Permittee shall state such information in a startup, shutdown, and malfunction report.

2. Actions taken to minimize emissions during such startups, shutdowns, and malfunctions shall be summarized in the report and may be done in checklist form; if actions taken are the same for each event, only one checklist is necessary.

3. Such a report shall also include the number, duration, and a brief description for each type of malfunction which occurred during the reporting period and which caused or may have caused any applicable emission limitation to be exceeded.

B. The startup, shutdown, and malfunction report shall consist of the following:

A letter, containing the name, title, and signature of the owner or operator or other responsible official who is certifying its accuracy.

C. Reports shall only be required if a startup, shutdown or malfunction occurred during the reporting period.

D. The SSM Report shall be submitted to the Illinois EPA semiannually and shall be delivered or postmarked by the 30th day following the end of each calendar half (or other calendar reporting period, as appropriate).

E. If the owner or operator is required to submit excess emissions and continuous monitoring system performance (or other periodic) reports required by this permit, the startup, shutdown, and malfunction reports required under 40 CFR 63.10(d) may be submitted simultaneously with the excess emissions and continuous monitoring system performance (or other) reports.

F. If startup, shutdown, and malfunction reports are submitted with excess emissions and continuous monitoring system performance (or other periodic) reports, and the owner or operator receives approval to reduce the frequency of reporting for the latter under 40 CFR 63.10(e), the frequency of reporting for the startup, shutdown, and malfunction reports also may be reduced if the Illinois EPA does not object to the intended change. The procedures to implement the allowance in the preceding sentence shall be the same as the procedures specified in 40 CFR 63.10(e)(3).

ii. Immediate startup, shutdown or malfunction reports [40 CFR 63.10(d)(5)(ii)]

A. Notwithstanding the allowance to reduce the frequency of reporting for periodic startup,

shutdown, and malfunction reports under 40 CFR 63.10(d)(5)(i), any time an action taken by an owner or operator during a startup or shutdown that caused the source to exceed any applicable emission limitation in the relevant NESHAP emission standards specified in Section 7 of this CAAPP, or malfunction (including actions taken to correct a malfunction) is not consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, the owner or operator shall submit an immediate report stating the actions taken for that event within 2 working days after commencing actions inconsistent with the plan and a follow-up report submitted within 7 working days after the end of the event.

B. The immediate report shall consist of a telephone call (or facsimile (FAX) transmission) to the Illinois EPA.

C. The follow-up report shall consist of the following:

1. The name, title, and signature of the owner or operator or other responsible official who is certifying its accuracy and explaining the circumstances of the event.

2. The reasons for not following the startup, shutdown, and malfunction plan.

3. Description all excess emissions and/or parameter monitoring exceedances which are believed to have occurred (or could have occurred in the case of malfunctions).

4. And actions taken to minimize emissions in conformance with 40 CFR 63.6(e)(1)(i).

5.10.6 Separate copies of all reports required by this permit shall be sent to the IEPA Regional Office in Collinsville.

5.10.7 <u>40 CFR 63, Subpart DDDDD (Notification of Compliance)</u>

a. Pursuant to 40 CFR 63.7545(b), the Permittee must submit an initial Notification according to 40 CFR 63.9(b)(2).

b. Pursuant to 40 CFR 63.7545(e), the Permittee must submit a Notification of Compliance Status according to 40 CFR 63.9(h)(2)(ii). For the initial compliance demonstration for each affected unit, the Permittee must submit the Notification of Compliance Status, including all

performance test results and fuel analyses, before the close of business on the 60th day following the completion of all performance test and/or other initial compliance demonstrations for the affected unit according to 40 CFR 63.10(d)(2).

c. For subject emission units, for which Permittee must conduct an initial compliance demonstration, the report shall include the information specified in 40 CFR 63.9(h)(2) and 63.7545(e).

d. In addition to the information required by 40 CFR 63.9(h)(2), the notification of compliance status must include the following certification(s) of compliance, as applicable, and signed by a responsible official:

i. “This facility complies with the requirements in 40 CFR 63.7540(a)(10) to conduct an annual or biennial tune-up, as applicable, of each unit.”

ii. “This facility has had an energy assessment performed according to 40 CFR 63.7530(e).”

iii. “No secondary materials that are solid waste were combusted in any affected unit.”

e. Pursuant to 40 CFR 63.7530(e), the Permittee must include with the Notification of Compliance Status a signed certification that the energy assessment was completed according to Table 3 of 40 CFR Part 63, Subpart DDDDD and is an accurate depiction of the affected facility.

f. Pursuant to 40 CFR 63.7530(d), the Permittee must submit a signed statement in the Notification of Compliance Status report that indicates a tune-up was completed on each existing unit firing natural gas with a heat input capacity of less than 10 million Btu per hour.

5.11 Source-Wide Operational Flexibility/Anticipated Operating Scenarios

No source-wide operational flexibility/anticipated operating scenarios have been established in this permit.

5.12 Source-Wide Compliance Procedures

Compliance Provisions for Condition 5.6.2(c) (adopted from FESOP 94120017):

a. Compliance with the lbs/3-hours limits in Condition 5.6.2(c) shall be demonstrated by using emission rate calculations for eight discrete 3-hour periods per day, with the first period beginning at midnight.

b. Compliance with the daily emission limits in Condition 5.6.2(c) shall be demonstrated by using emission rate calculations on a daily block basis (i.e., midnight to midnight).

c. The compliance calculations shall be the primary compliance method for determining compliance with the emission limits in Condition 5.6.2(c), except for the blast furnace casthouse baghouse and iron spout baghouse, for which stack testing shall be the primary means of determining compliance.

d. Total SO_2 emissions from an unit operating group for determination of compliance with the SO_2 limits in Condition 5.6.2(c) shall be the sum of the emissions resulting from the use of COG and fuel oil at the unit operating group, i.e.:

Lbs SO_2 per unit operating group = SO_2 emissions from fuel oil usage + SO_2 emissions from COG usage

Note: When FESOP Permit 94120017 was originally issued, the SO_2 emissions which would result from the use of blast furnace gas and natural gas in the unit operating groups were accounted for in the SO_2 limits of that permit. This was accomplished by lowering the permitted SO_2 from the SO_2 levels used for air quality modeling by an amount equal to the SO_2 which would have been emitted should the unit operating groups use blast furnace gas or natural gas continuously. The SO_2 emissions from blast furnace gas and natural gas were calculated using standard emission factors as found in AIRS Facility Subsystem, Source Classification Codes and Emission Factor Listing for Criteria Air Pollutants, EPA Document Number EPA 450/4-90-003, and Compilation of Air Pollution Emission Factors, Vol. 1, Stationary Point and Other Sources, AP-42.

e. The SO_2 emissions attributable to fuel oil usage shall be calculated from the records required by the CAAPP permit for usage of fuel oil and the sulfur and heat content of oil (See Condition 5.9.4) and the following equation:

Lbs SO_2/period = gallons of oil burned per period x sulfur content in weight percent of the fuel oil used x density of the fuel oil used in pounds per gallon x 2.

f. The SO_2 emissions attributable to COG usage shall be calculated from the records required by the CAAPP permit for the amount of COG burned and the sulfur content of the COG (See Condition 5.9.1(e)) and the following equation:

Lbs SO_2/period = thousand standard cubic feet of COG burned per period x average H_2S content of the COG in grains per standard cubic foot for the period x 0.269.

g. Stack test measurement shall be the primary method of determining the compliance of the Blast Furnace Casthouse and Iron Spout Baghouse with the lbs/day limits in Condition 5.6.2(c). The secondary means of determining compliance shall be the following:

   i. The SO_2 attributable to the Blast Furnace Casthouse Baghouse shall be calculated using an emission factor of 0.173 lbs SO_2 per ton of hot metal cast.

   ii. The SO_2 attributable to the Iron Spout Baghouse shall be calculated using an emission factor of 0.0063 lbs SO_2 per ton of hot metal cast.

h. Compliance with the tons/yr limits in Condition 5.6.2(c)) shall be determined using a rolling total of 12 consecutive calendar months of data.

i. When fuel oil is used and data is not available for the fuel oil at the individual unit operating groups, the oil usage during such period shall be calculated from the data for total usage of oil apportioned among the individual operating groups using oil based on the relative heat inputs the unit operating group during that period.

j. Usage of COG shall be determined from data collected by the COG flow meters.

   Note: For this purpose, data from flow meters for both desulfurized and undesulfirized COG may be used in accordance with Condition 5.9.1(e)(i).

k. The average H_2S content of COG for the lbs/3-hours compliance calculations shall be calculated using an arithmetic average of all available H_2S data during the 3-hour period that COG was burned. In the event that the H_2S monitoring system is unable to obtain a single reading for the 3-hour period, the H_2S content for that 3-hour period shall be obtained by one of the alternative methods specified in Condition 7.3.9(f) of this permit (i.e., manual sampling of H_2S content or determined by type of coal used during that period and previous recorded H_2S content when using this coal type).

   For this purpose, data from H_2S monitoring systems for both desulfurized and undesulfurized COG, in accordance with Condition 5.9.1(e)(ii), shall be used as appropriate depending upon whether desulfurized or undesulfurized COG is being combustion.

l. The daily average H_2S content of COG for use in the lbs/day compliance calculations shall be calculated using an arithmetic average of all available hourly average H_2S content data for

that day, and at least data from 75% of the daily operating hours.

Note: For this purpose, data from the H_2S monitoring systems for both desulfurized and undesulfurized COG, in accordance with Condition 5.9.1(e)(ii).

5.13 General Procedures for Certain Permit Limits on Emissions

Pursuant to Sections 39.5(7)(b) and (p)(v) of the Act, these procedures are applicable for the emission limits in Conditions 7.1.6(b)(i) through (iv), 7.4.6(b) through (f), 7.5.6(c) through (g) and 7.6.6(a) through (e), which address the rates of emissions or “emission factors” (commonly in pounds/ton) and the annual emissions or “maximum emissions” (in tons/year) of certain emission units, as the Permittee determines compliance with these limits with “emission factors,” using the common meaning of this term. In particular, notwithstanding the fact that the above listed conditions set “emission factor limits” or limits on the rates of emissions, for purposes of this condition, an “emission factor” is a set value for the mass of a pollutant emitted by a particular emission unit relative to the amount of material that is processed or handled by the unit, or in the case of lead, a set value for the mass of lead emissions for each hour that the particular unit operates, which value is used in the determination of the emissions of the unit.

Note: For the emission units (i.e., operations and processes) that are subject to the above emission limits, Conditions 7.1.9(h), 7.4.9(h)(vii) and (i), 7.5.9(f) and (g), and 7.6.9(c) require the Permittee to keep records for the emissions factors that it is using to determine compliance with these emission limits, along with records for the emissions of these units. The specific emission factors being used by the Permittee for the various subject units, based on information provided by the Permittee as of the date of issuance of this revised permit, are found in Attachment 3 of this permit.

a. The emission factors used by the Permittee to determine compliance with these emission limits shall not understate actual emissions.

b. Compliance with these emission limits shall be determined as follows. For terms that are expressed in pounds per ton or, for lead, pounds per hour (i.e., the same terms as the relevant emission factor), compliance shall be determined by comparison against the relevant emission factor for the unit and mode of operation, as applicable. For each annual limit, compliance shall be determined by comparison against the annual emissions of the unit, calculated as the product of the actual annual operation of the unit and the relevant emission factor. If more than one emission factor is needed to address the actual annual emissions of a unit, to address different modes of operation, the annual emissions of the unit shall be calculated as the sum of the annual emissions, calculated as above, for each mode of operation of the unit for which there is a different emission factor. If there are additional emissions that are not accounted

for by the established emission factor(s), these additional emissions shall also be included in the calculation of annual emissions.

c. The Permittee shall, at a minimum, review and, if necessary, update the relevant emission factors that it is using as follows, to assure that the emission factors that it uses to calculate emissions for purposes of determining compliance with these limits are appropriate, i.e., do not understate actual emissions.

i. For emission units that are subject to limits for which emission testing is required to be conducted by this permit, whenever such testing is conducted, relevant emission factors shall be reviewed based on the results of such testing and, if necessary, updated based on those results.

ii. For emission units that are subject to limits for which emission testing is not required to be conducted by this permit, the relevant emission factors shall be reviewed and, if necessary, updated on at least an annual basis, considering new information on emissions of such units that has become available, including revisions of USEPA's *Compilation of Air Pollutant Emission Factors*, AP-42, other information published by USEPA, information related to other emission units operated by U.S. Steel, information presented in specific papers and reports concerning the steel industry, and other salient information.

d. The Permittee shall comply with the following reporting requirements related to the emission factors that it is using to determine compliance with these emission limits:

i. If the Permittee updates the emission factors that it is using, as a result of its review of the relevant emission factors, as provided for by Condition 5.13(c)(i) or (ii), copies of the revised records for such emission factor(s) shall be submitted to the Illinois EPA in accordance with Condition 5.9.6(c)(ii).

ii. At the same time that it submits its Annual Emission Report, as addressed by Condition 5.10.2, the Permittee shall also submit a report confirming its review of relevant emission factors in accordance with Condition 5.13(c)(i) and (ii) during the previous year, which report shall, for each applicable emission limit, include an identification of the testing conducted during the previous year, if any, or a description of all new information that was considered, if any, and the findings and conclusion of its review of such information and any updates that it made to the emission factors that it uses, with explanation.

e. Upon written notification from the Illinois EPA or USEPA that it has determined one or more of the following, the Permittee shall conduct appropriate further review for the emission factor(s)

that are the subject of such notification and submit a written response to the Illinois EPA and, if applicable, USEPA within 45 days, which response may be accompanied by updates to those emission factor(s).

i. The Permittee's records for the applicable emission factor(s), as addressed by Condition 5.9.6(c)(ii) or 5.13(d)(i) do not contain adequate documentation for the selected emission factor(s).

ii. The Permittee's report pursuant to Condition 5.13(d)(ii) does not provide adequate explanation for the updates that were made to the emission factor(s).

iii. The emission factor(s) used by the Permittee do not appear to appropriately address a new mode of operation of the subject unit.

iv. There is new information, as described in or included with the notification, that appears pertinent that the Permittee has not considered in its review for the emission factor(s).

5.14 Source-wide State-Only Conditions

5.14.1 Permitted Emissions for Fees

Emission limitations are not set for the source for the purpose of permit fees. The Permittee shall pay the applicable fee pursuant to Section 39.5 of the Act.

6.0 CONDITIONS FOR EMISSIONS CONTROL PROGRAMS

This section is reserved for emissions control programs. As of the date of issuance of this permit, there are no such programs applicable to this source.

7.0 UNIT SPECIFIC CONDITIONS FOR SPECIFIC EMISSION UNITS

7.1 Material Handling and Processing Operations

7.1.1 Description

Coal handling systems:

The crusher is mainly used in the winter to break-up frozen chunks of coal to prepare the coal to be processed in the pulverizer.

There are two coal pulverizers. Only one pulverizer can be used at any one time. The remaining pulverizer is maintained as a backup unit. The pulverizers reduce the size of the coal to prepare it for the coking process. A baghouse controls the discharge outlets of the coal pulverizers.

Blast furnace raw material handling systems:

Raw materials such as coke, iron-bearing materials, and fluxes are charged to blast furnaces in the iron making process. The materials are charged in the top of the furnace from skip cars, which are filled in the stockhouse from conveyors or hoppers. Iron pellets and coke are screened prior to charging.

New Coke Conveyance System:

The new coke conveyor system transfers coke from Gateway Energy to US Steel to be used in the existing Blast Furnaces.

Steel making system:

Raw materials used in the BOFs and LMF are delivered to the facility by both truck and railcar. The trucks and railcars are either unloaded to the ground or directly into an underground feed hopper. Materials unloaded to the ground are placed in storage piles, or in super sacks, endloaders are used to transfer the materials from the storage piles or super sacks to the underground feed hopper. The underground feed hopper then feeds material onto BOF material transfer conveyor C-1. This material transfer is controlled by the Trackhopper Baghouse, this bag house empties back onto C-1 conveyor.

Materials added in the BOF and LMF are transferred from the underground feed hopper, by a conveyor system consisting of three conveyors (nos. C-1, C-2, and C-3) arranged in series. From conveyor C-3 the materials are offloaded into storage bins 1 thru 10, or a rotating hopper known as the lazy susan, or onto conveyor C-5. The storage bins unload materials to conveyor C-4, which transfers and off-loads the materials into the BOF feed hoppers for #1 vessel or #2 vessel. The lazy susan feeds directly into the BOFs Alloy transfer car. Conveyor C-5 transfers materials to the LMF material handling system. All operations carried out within this unit take place within

enclosed structures. The transfer from conveyors C-1 to C-2 and C-2 to C-3 are controlled by the Binfloor Baghouse, this bag house empties into Bin #2.

Materials are transferred from the BOF Binfloor to the LMF on conveyor C-5. This conveyor off-loads into storage bins which transfer to conveyor C-6. The emissions from the transfer from conveyor C-5 to C-6 are handled by Baghouse #1. Additional raw materials used in the LMF are transferred from the Tripper Conveyor to a set of storage bins. Emissions generated by loadout of the Tripper Conveyor are controlled by Baghouse #2.

Note: This narrative description is for informational purposes only and is not enforceable.

7.1.2 List of Emission Units and Air Pollution Control Equipment

Area	Emission Unit Description	Emission Control Equipment	Date Constructed
Coal Handling and Processing	Coal Crusher	None	Pre-1974
	Coal Pulverizers (2)	Baghouse	
	Conveyors	None	
Blast Furnace	Screens (3) • Two Coke • One Iron Pellet	None	Pre-1974
	Conveyors and Feed Hoppers	None	
	Stock House Storage Bins	None	
	New Coke Conveyance System • Conveyors and Hoppers • Day Bins	Baghouses	2009
Steelmaking	Dump Pit Conveyor	Trackhopper Baghouse	Pre-1974
	Conveyors and Storage Bins	Bin floor Baghouse	
	LMF Conveyors and Storage Bins	Baghouse #1	Prior to 1986

7.1.3 Applicable Provisions and Regulations

a. i. The “affected material handling operations” for the purpose of these unit-specific conditions, are the emission units described in Conditions 7.1.1 and 7.1.2.

ii. The “affected crushing operations” for the purpose of these unit-specific conditions, are the crusher and pulverizers described in Conditions 7.1.1 and 7.1.2.

iii. The “affected screening operations” for the purpose of these unit-specific conditions, are the iron

pellet and coke screens described in Conditions 7.1.1 and 7.1.2.

iv. The “affected transfer operations” for the purpose of these unit-specific conditions, are the conveyors, storage bins, new coke conveyance system and feed hoppers described in Conditions 7.1.1 and 7.1.2.

b. Pursuant to 35 IAC 212.316(b), the Permittee shall not cause or allow fugitive particulate matter emissions generated by the affected crushing and screening operations to exceed an opacity of 10 percent.

c. Pursuant to 35 IAC 212.316(f), the Permittee shall not cause or allow fugitive particulate matter emissions generated by the affected transfer operations to exceed an opacity of 20 percent.

d. Pursuant to 35 IAC 212.321(a), the Permittee shall not cause or allow the emission of particulate matter into the atmosphere in any one hour period from the new coke conveyor system or LMF conveyors and LMF storage bins for which, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in subsection (c) of 35 IAC 212.321 (see also Attachment 2).

e. Pursuant to 35 IAC 212.322(a), the Permittee shall not cause or allow the emission of particulate matter into the atmosphere in any one hour period from any affected material handling operation for which construction or modification commenced prior to April 14, 1972*, which, either alone or in combination with the emission of particulate matter from all other similar process emission units at a source or premises, exceeds the allowable emission rates specified in subsection (c) of 35 IAC 212.322 (see also Attachment 2).

* The new coke conveyor system and LMF conveyors and LMF storage bins constructed after April 14, 1972, is not subject to 35 IAC 212.322.

f. Pursuant to 35 IAC 212.458(b)(7) and (c), the Permittee shall not cause or allow emissions of PM10, other than that of fugitive particulate matter, into the atmosphere from any affected material handling operation to exceed 0.01 gr/scf during any one hour period, except for this mass emission limit shall not apply to those emission units with no visible emissions other than that of fugitive particulate matter; however, if a stack test is performed, this subsection is not a defense to a finding of a violation of the mass emission limits contained in this condition.

7.1.4 Non-Applicability of Regulations of Concern

The emission limitations of 35 IAC 212.324 are not applicable to the affected material handling operations, as provided by 35 IAC 212.324(a)(3), because the affected operations are subject to standards in 35 IAC Part 212, Subpart R, "Primary and Fabricated Metal Products and Machinery Manufacture".

7.1.5 Control Requirements and Work Practices

a. The affected material handling operations shall be operated under the provisions of a fugitive particulate matter operating program consistent with the provisions of 35 IAC 212.309, 212.310 and 212.312 (see also Condition 5.3.2(a)) [35 IAC 212.309].

b. Pursuant to 35 IAC 212.307, material collected by control equipment on the affected material handling operations shall be handled in accordance with Condition 5.3.2(e).

c. For the air pollution control equipment on the affected operations, the Permittee shall comply with maintenance and repair requirements in 35 IAC 212.324(f), as follows, pursuant to 35 IAC 212.458(d):

   The Permittee shall maintain and repair all air pollution control equipment in a manner that assures that the emission limits and standards in 35 IAC 212.458 shall be met at all times. Proper maintenance shall include the following minimum requirements:

   i. Visual inspections of air pollution control equipment;

   ii. Maintenance of an adequate inventory of spare parts; and

   iii. Expeditious repairs, unless the emission unit is shutdown.

d. BACT/LAER requirements for the new coke conveyor system, from Permit 06070088:

   i. PM and PM_{10} emissions from the day bins shall be controlled by [T1]:

      A. Enclosure of the day bin so as to prevent visible fugitive emissions, as defined by 40 CFR 60.671.

      B. Aspiration of the day bins or the enclosure in which they are enclosed to a control device, which device shall be operated in accordance with good air pollution control practice to

minimize emissions. For this purpose, the control device shall be a baghouse or other filtration type device unless the Permittee demonstrates and the Illinois EPA concurs that another type of control device is preferable due to considerations of operational safety.

ii. PM and PM_{10} emissions from the new coke conveyance system shall be controlled by enclosure so as to prevent visible fugitive emissions, as defined by 40 CFR 60.671 [T1].

iii. Emissions of PM and PM_{10} from the control devices for the new coke conveyance system shall not exceed 0.005 gr/dscf [T1].

Condition 7.1.5(d) represents the application of Best Available Control Technology and Lowest Achievable Emission Rate.

7.1.6 Production and Emission Limitations

a. Production and emission limits for the new coke conveyor system from Permit 06070088:

i. The new coke conveyance system shall not transfer more than 740,000 tons of coke per year [T1].

ii. The emissions from the new coke conveyance system shall not exceed 0.95 tons/year of PM and 0.45 tons/year of PM_{10} [T1].

iii. Compliance with the annual limits of Condition 7.1.6(a) shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total) [T1].

b. Emission limits for blast furnace and steel making material handling operations from Permit 95010001:

i. Emissions from Material HS and Deslagging Station shall not exceed the following limits [T1]:

Pollutant	Emission Factors (Lbs/Ton of steel)	Maximum Emissions (Tons/Yr)
PM	0.00355	6.35
PM_{10}	0.00355	6.35

ii. BOF Additive System (Trackhopper Baghouse) emissions shall not exceed the following limits [T1]:

Pollutant	Emission Factors (Lbs/Ton of steel)	Maximum Emissions (Tons/Yr)
PM	0.00032	0.57
PM_{10}	0.00032	0.57

iii. Flux conveyor & transfer points (Bin Floor Baghouse) emissions shall not exceed the following limits [T1]:

Pollutant	Emission Factors (Lbs/Ton of steel)	Maximum Emissions (Tons/Yr)
PM	0.0016	2.86
PM_{10}	0.0016	2.86

iv. Iron Pellet Screen emissions shall not exceed the following limits [T1]:

Pollutant	Emission Factors (Lbs/Ton Iron)	Maximum Emissions (Tons/Yr)
PM	0.00279	6.01
PM_{10}	0.00279	6.01

v. Compliance with the annual limits in Condition 7.1.6(b) shall be determined based on a calendar year [T1].

7.1.7 Testing Requirements

The following emission tests and opacity observations shall be conducted pursuant to Section 39.5.(7)(d) and (p) of the Act.

a. i. The Permittee shall measure the opacity from the affected crushing, screening and transfer operations unless prolonged weather conditions preclude scheduled observations. These observations shall be conducted by a qualified observer in accordance with Method 9, as further specified below, pursuant to Section 39.5(7)(d) of the Act.

A. This testing shall be conducted at least annually.

B. Upon written request by the Illinois EPA, such testing shall be conducted for specific affected operation(s) within 45 calendar days of the request or by the date agreed upon by the Illinois EPA, whichever is later. At least 30 days prior to the scheduled test date, the Permittee shall submit a detailed test plan to

the Illinois EPA, describing the manner of operation of the affected activity and all control measures that will be implemented during the testing. The results of the testing will be submitted within thirty calendar days of the completion of the tests.

ii. The duration of opacity observations for each test shall be at least 30 minutes (five 6-minute averages).

b. The Permittee shall test for opacity and PM/PM10 emissions from the baghouse for the coal pulverizers and either the trackhopper baghouse, bin floor baghouse or baghouse #1 as will be specified by the Illinois EPA within 30 days of receipt of the test protocol. These two tests shall be completed within 30 months of the effective date of this permit condition. The Permittee shall use the following methods:

Location of Sample Points	Method 1
Gas Flow and Velocity	Method 2, 2A – H
Flue Gas Weight	Method 3, 3A – C
Moisture	Method 4
PM/PM_{10} as provided for by 35 IAC 212.108	Method 5, 201 or 201A

7.1.8 Monitoring Requirements

The Permittee shall perform the following inspections, pursuant to Section 39.5(7)(p)(ii) of the Act:

a. Affected material handling operations other than the new coke conveyance system.

The Permittee shall perform quarterly inspections of the control measures, while the affected material handling operations are in use. For purposes of this condition, all affected material means each type of material handled. Types of material are materials such as: 1) coal; 2) coke; 3) limestone; 4) iron pellets; 5) alloy materials; 6) desulfurization reagents; and 7) slag materials. These inspections shall, at a minimum, include the following:

i. Verification that control measures, including reliance on characteristics of materials, is being properly implemented. For conveyors, these inspections shall include, where applicable, verification that all covers, enclosures and dribble pans are present and in good working condition. For crushers, these inspections shall also include verifications for choke feeding.

ii. For the baghouses on the affected material handling operations – a check of differential pressure and

inspection of the dust removal system, compressed air system, bag condition, fan condition and structural components.

iii. As part of the inspections, the Permittee shall perform observations for visible emissions by Method 22. These observations shall be conducted during the operations of each activity for a minimum of 18 minutes, or for activities that operate on a batch basis, for a minimum of six consecutive batches or 18 minutes. If visible emissions are observed, the Permittee shall take corrective action within 2 hours to return the status of the operations to no visible emissions or observations of opacity by Method 9 shall be conducted. For the purpose of this condition, returning the status of operations to no visible emissions does not include, for any activity, temporary idling or the lack of operations between batches.

b. Affected new coke conveyance system

i. The Permittee shall conduct inspections of the new coke conveyor system on at least a monthly basis for the specific purpose of verifying that control measures required to control emissions from the new coke conveyor system are being properly implemented.

ii. These inspections shall include observation for the presence of visible emissions, performed in accordance with USEPA Method 22, from the conveyors and day bins.

7.1.9 Recordkeeping Requirements

The Permittee shall maintain records of the following items, pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. The Permittee shall keep the following file(s) and log(s):

File(s) containing the following information for the affected material handling operations with supporting information:

i. Information related to the dust collection equipment associated with the affected operations, including design control efficiency or performance specifications and maximum design particulate matter emissions, gr/dscf.

ii. The maximum design capacity of each operation, (tons/hr).

b. For the air pollution control equipment on affected operations, the Permittee shall keep the following records

related to maintenance and repair, as required by 35 IAC 212.458(d):

i. Records of inventory of spare parts and documentation of inspections, maintenance, and repairs of all air pollution control equipment shall be kept in accordance with 35 IAC 212.324(f) [35 IAC 212.324(g)(1)].

ii. Records documenting any period during which any process emission unit was in operation when the air pollution control equipment was not in operation or was malfunctioning so as to cause an emissions level in excess of the emissions limitation. These records shall include documentation of causes for pollution control equipment not operating or such malfunction and shall state what corrective actions were taken and what repairs were made [35 IAC 212.324(g)(2)].

iii. A written record of the inventory of all spare parts not readily available from local suppliers shall be kept and updated [35 IAC 212.324(g)(3)].

c. The Permittee shall keep the written records required by 35 IAC 212.316(g)(1) as follows:

i. For fugitive particulate matter emission units subject to 35 IAC 212.316, records related to the application of control measures for compliance with the opacity limitations of 35 IAC 212.316, including submittals to the Illinois EPA an annual report containing a summary of the information in these records.

ii. These records shall include at least the information specified by 35 IAC 212.316(g)(2), as follows:

A. The name and address of the source;

B. The name and address of the owner and/or operator of the source;

C. A map or diagram showing the location of all emission units controlled;

D. For application of physical or chemical control agents: the name of the agent, application rate and frequency, and total quantity of agent, and, if diluted, percent of concentration, used each day; and

E. A log recording incidents when control measures were not used and a statement of explanation.

iii. These records shall be handled as follows:

A. Copies of all records required by 35 IAC 212.316 shall be submitted to the Illinois EPA within ten (10) working days after a written request by the Illinois EPA and shall be transmitted to the Illinois EPA by a company-designated person with authority to release such records [35 IAC 212.316(g)(3)].

B. The records required under 35 IAC 212.316 shall be kept and maintained for at least five (5) years at the source and be available for inspection and copying by Illinois EPA representatives during working hours [35 IAC 212.316(g)(4)].

d. The Permittee shall maintain records for:

i. The amount of coke handled by the new coke conveyor system (tons/month and tons/year).

ii. The amount of iron pellets screened (tons/month and tons/year).

e. The Permittee shall maintain the following records for the inspections required by Condition 7.1.8:

i. For the inspections required by Condition 7.1.8(a) for each affected material handling operation:

A. Date and time the inspection was performed and name(s) of inspection personnel.

B. The observed condition of the control measures for each affected operation, including the presence of any visible emissions or accumulations of dust in the vicinity of the operation.

C. A description of any maintenance or repair associated with established control measures that are recommended as a result of the inspection and a review of outstanding recommendations for maintenance or repair from previous inspection(s), i.e., whether recommended action has been taken, is yet to be performed or no longer appears to be required.

D. A summary of the observed implementation or status of actual control measures.

ii. For the inspections required by Condition 7.1.8(b) for the affected new coke conveyor system, pursuant to Permit 06070088:

A. The Permittee shall maintain a file, which shall be kept current, that contains the maximum operating capacity of the new coke conveyance system (tons/day).

B. 1. The Permittee shall keep inspection and maintenance log(s) or other records for the control measures associated with the new coke conveyance system, including enclosures and fabric filters.

2. These records shall include the following information for the inspections required by Condition 7.1.8(a) and (b):

I. Date and time the inspection was performed.

II. The observed condition of the control measures, including the presence of any visible emissions.

III. A description of any maintenance or repair associated with the control measures that are recommended as a result of the inspection and a review of outstanding recommendations for maintenance or repair from previous inspection(s), i.e., whether recommended action has been taken, is yet to be performed or no longer appears to be required.

f. In the operational logs or other records for the operation of the affected material handling operations for steelmaking, the Permittee shall include information confirming routine implementation of normal practices for unloading of materials into the receiving hopper and housekeeping practices for this hopper and information identifying departures from those practices, with description, explanation, and corrective actions taken.

g. The Permittee shall maintain records of the following for each incident when any affected material handling operations and the new coke conveyor system operate without control measures:

i. The date of the incident and identification of the operations that were involved.

ii. A description of the incident, including the control measures that were not present or implemented; the control measures that were present, if any; other control measures or mitigation measures that were

implemented, if any; and the magnitude of the PM emissions during the incident.

iii. The time at and means by which the incident was identified, e.g., scheduled inspection or observation by operating personnel.

iv. The length of time after the incident was identified that the operations continued to operate before control measures were in place or the operations were shutdown (to resume operation only after control measures were in place) and, if this time was more than one hour, an explanation why this time was not shorter, including a description of any mitigation measures that were implemented during the incident.

v. The estimated total duration of the incident, i.e., the total length of time that the operations ran without control measures and the estimated amount of coal handled during the incident.

vi. A discussion of the probable cause of the incident and any preventative measures taken.

vii. A discussion whether any applicable emission standards, as listed in Condition 7.1.3, may have been violated during the incident, with supporting explanation.

h. The Permittee shall maintain the following records for the new coke conveyor system and each other operation subject to limits on PM/PM_{10} emissions in Condition 7.1.6:

i. A file containing the emission factors used by the Permittee to determine emissions of each operation, with supporting documentation. These records shall be reviewed and updated by the Permittee as necessary to assure that the emission factors that it uses to determine emissions of the affected operations do not understate actual emissions. These records shall be prepared and copies sent to the Illinois EPA in accordance with Condition 5.9.6(c).

ii. Records for any periods of operation of such operations that are not otherwise addressed in the required records during which the established emission factor in Condition 7.1.9(f)(i) would understate actual emissions of such operation, with description of the period of operation and an estimate of the additional emissions during such period that would not be accounted for by the established factor, with supporting explanation and calculations.

iii. Records for the annual PM/PM_{10} emissions of each operation, based on operating data and appropriate emission factors for comparison to the limits in Conditions 7.1.6(b), with supporting documentation and calculations.

i. The Permittee shall keep records for all opacity measurements conducted in accordance with Method 9 that it conducts or that it orders to be conducted. For each occasion on which such measurements are made, these records shall include the identity of the observer, a description of the measurements that were made, the operating condition of the operations, the observed opacity, and copies of the raw data sheets for the measurements.

j. The Permittee shall keep copies of all tests performed on the affected material handling operations and new coke conveyor system.

7.1.10 Reporting Requirements

a. i. The Permittee shall submit quarterly and annual reports to the Illinois EPA in accordance with 35 IAC 212.316(g)(1) and (5) [35 IAC 212.316(g)].

ii. Pursuant to 35 IAC 212.324(g)(6), upon written request by the IEPA, a report shall be submitted to the IEPA for any period specified in the request stating the following: the dates during which any process emission unit was in operation when the air pollution control equipment was not in operation or was not operating properly, documentation of causes for pollution control equipment not operating or not operating properly, and a statement of what corrective actions were taken and what repairs were made.

iii. Pursuant to Permit 06070088 for the new coke conveyor system, the Permittee shall notify the Illinois EPA within 30 days of deviations from applicable emission standards or operating requirements that continue* for more than 24 hours.

* For this purpose, time shall be measured from the start of a particular event. The absence of a deviation for a short period shall not be considered to end the event if the deviation resumes. In such circumstances, the event shall be considered to continue until corrective actions are taken so that the deviation ceases or the Permittee takes the affected unit out of service for repairs.

b. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air

Compliance Section, within 30 days of deviations by the affected material handling operations and new coke conveyor system from applicable requirements as follows:

A. Requirements in Condition 7.1.3(b) through (f).

B. Requirements in Condition 7.1.5.

C. Requirements in Condition 7.1.6.

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

iii. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations from permit requirements as part of the semiannual monitoring reports required by Condition 8.6.1.

iv. All deviation reports described in Condition 7.1.11(b) above shall contain the following:

A. Date, time and duration of the deviation;

B. Description of the deviation;

C. Probable cause of the deviation; and

D. Any corrective actions or preventive measures taken.

7.1.11 Operational Flexibility/Anticipated Operating Scenarios

Operational flexibility is not set for the affected material handling operations and new coke conveyor system.

7.1.12 Compliance Procedures

Compliance with the emission standards in Condition 7.1.3 and the operational/emission limits in Condition 7.1.6 is addressed by the testing requirements of Condition 7.1.7, inspection requirements of Condition 7.1.8 and recordkeeping requirements of Condition 7.1.9.

7.1.13 State-Only Conditions

State-only conditions are not being established.

7.2 Coke Production

7.2.1 Description

Two coke oven batteries (45 ovens each), dual collecting main by-product coke oven batteries, referred to as batteries A and B, are utilized at this iron and steel mill. Each is capable of processing 454,000 tons/year of coal. Potential emissions from these batteries consist of particulate matter, sulfur dioxide, nitrogen oxides, carbon monoxide, volatile organic materials, and HAPs.

Topside:

Emission points include leaks from coke oven charging, lids, off takes, soaking and emergency flares. Coal is charged to the ovens through four charging port lids, on each oven, utilizing sequential charging with steam aspiration to the collecting mains. Each oven has two off takes to the collecting mains that duct raw coke oven gas from the coking process to the by-products plant (see Section 7.3 of this permit). Soaking occurs after the coking process is completed, when an oven is dampered off from the collecting mains and its off takes' standpipes are opened before beginning pushing. Each battery also has an emergency by-pass on the collecting main (one on each main, two per battery). In the event of an emergency which would lead to excess pressure in a main, e.g., loss of suction from the by-product plant, the by-pass opens. The raw coke oven gas is then combusted in the associated emergency flare.

Doors:

Emissions consist of leaks from coke oven doors. Each oven has two doors, with one on its push side and one on its coke side.

Pushing:

Once the coking cycle in an oven has been completed, the push and coke side doors are removed, respectively, by the pushing machine and coke-side door machines. A ram on the pushing machine pushes the coke out through a guide on the door machine. The coke falls through the guide, which is covered by a hood on the machine, and into the quench box. The emissions from oven pushing are controlled by the pushing system. This mobile control system consists of a venturi scrubber, mist eliminator and exhaust fan. The Permittee currently has two mobile scrubber cars for pushing (PCS cars #3 and #4). The quench box and car travel with this system to the coke quenching operation.

Coke Quenching:

In this operation, loads of hot coke from the ovens are quenched with water. There are two locations where quenching normally takes place. The primary is the West Quench Tower. This tower is equipped with a baffle system. The east quench station,

which is utilized as a backup for the West Tower, does not currently have a quench tower, however, the Permittee is currently engaged in a project to upgrade the quenching operations, adding a quench tower to the East Quench Station and replacing the conventional Quench Tower at the West Quench Station with a low emission quench tower (Construction Permit 08060026).

Underfiring:

Coke oven gas (COG) is combusted to generate the heat required to convert coal to coke. This COG would be treated by both by-products plant and, except during maintenance and outage, by the COG desulfurization system. Natural gas may also be added through the blending station in order to stabilize the heat content of the COG. Emissions from this unit occur at the main stacks of each battery and are mainly the by-products of combustion, including particulate matter, sulfur dioxide, nitrogen oxides, carbon monoxide, and volatile organic materials.

Note: This narrative description is for informational purposes only and is not enforceable.

7.2.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
Coke Oven Batteries “A” and “B”	Coke Oven Battery “A”	Battery “A” was rebuilt between 1979 and 1980	Emergency Bypass Flares
	Coke Oven Battery “B”	Battery “B” was rebuilt between 1981 and 1982	Emergency Bypass Flares
	2 Larry Cars		None
	2 Pushing/Quench Cars		Mobile Venturi Scrubber (PCS Cars #3 & #4)
	East Quench Station (backup)		Tower and Baffles (planned)
	West Quench Station		Tower and Baffles
	Coke Oven Underfiring (coke oven combustion stacks)		None

7.2.3 Applicable Provisions

a. The “affected coke oven operations” for the purpose of these unit-specific conditions, are the emission units and activities described in Conditions 7.2.1 and 7.2.2.

b. The affected coke oven operations are subject to 35 IAC 212.443. Certain provisions of this regulation are discussed further in this subsection.

c. i. The following affected coke oven operations are subject to 40 CFR Part 63, Subpart L Coke Oven Batteries: charging, doors, lids, off takes, collecting mains and bleeder stacks. The Permittee is complying with the so-called LAER track under this NESHAP, as provided for by 40 CFR 63.304.

ii. For affected coke oven operations, the Permittee shall comply with applicable provisions of the NESHAP, 40 CFR 63 Subpart A.

d. i. The following affected coke oven operations are subject to 40 CFR Part 63, Subpart CCCCC: pushing, soaking, quenching and battery underfiring stacks.

ii. For affected operations at the coke oven battery, the Permittee shall comply with applicable provisions of the NESHAP, 40 CFR 63 Subpart A as specified in Table 1 in 40 CFR 63 Subpart CCCCC.

7.2.3-1 Applicable Standards: Coke Oven Charging

a. 35 IAC 212.443(b)(1)(A)

No person shall cause or allow the emission of visible particulate matter from any coke oven charging operation, from the introduction of coal into the first charge port, as indicated by the first mechanical movement of the coal feeding mechanism on the larry car, to the replacement of the final charge port lid for more than a total of 125 seconds over 5 consecutive charges; provided however that 1 charge out of any 20 consecutive charges may be deemed an uncountable charge at the option of the operator.

Compliance with this limit shall be determined in accordance with the applicable procedures in 35 IAC 212.443(b)(1)(B) and Condition 7.2.12.

b. 40 CFR 63.304(b)(2)(iv)

Emissions to the atmosphere from coke oven charging shall not exceed 12 seconds of visible emissions per charge, as determined by the procedures in 40 CFR 63.309(d)(2).

c. Battery B

The aggregate of visible emissions from the charging of coke ovens at Battery B shall not exceed a total 55 seconds during any 5 consecutive charges [T1].

Note: This limit is the determination of LAER for charging for Battery B made in Construction Permit C808048.

7.2.3-2 Applicable Standards: Leaks from Doors

a. 35 IAC 212.443(d)

i. No person shall cause or allow visible emissions from more than 10 percent of all coke oven doors at any time. Compliance shall be determined by a one pass observation of all coke oven doors on any one battery.

ii. No person shall cause or allow the operation of a coke oven unless there is on the plant premises at all times an adequate inventory of spare coke oven doors and seals and unless there is a readily available coke oven door repair facility.

b. Battery B

At no time shall there be any visible emissions from more than 5 percent of the door areas on Battery B [T1].

Note: This limit is the determination of LAER for door leaks for Battery B was established in Construction Permit C808048.

c. 40 CFR 63.304(b)(3)(ii)

3.3 percent leaking coke oven doors for each by-product coke oven battery not subject to the emission limitation 40 CFR 63.304(b)(3)(i), as determined by the procedures in 40 CFR 63.309(d)(1).

7.2.3-3 Applicable Standards: Leaks from Lids

a. 35 IAC 212.443(e)

No person shall cause or allow visible emissions from more than 5 percent of all coke oven lids at any time. Compliance shall be determined by a one pass observation of all coke oven lids.

b. Battery B

There shall be no visible emissions from more than 1 percent of the charging ports or lids [T1].

Note: This limit is the determination of LAER for lid leaks for Battery B made in Construction Permit C808048.

c. 40 CFR 63.304(b)(2)(ii)

0.4 percent leaking topside port lids, as determined by the procedures in 40 CFR 63.309(d)(1).

7.2.3-4 Applicable Standards: Leaks from Off Takes

a. 35 IAC 212.443(f)

No person shall cause or allow visible emissions from more than 10 percent of all coke oven off take piping at any time. Compliance shall be determined by a one pass observation of all coke oven off take piping.

b. Battery B

There shall be no visible emissions from more than 4 percent of the off take piping on the coke ovens on Battery B [T1].

Note: This limit is the determination of LAER for off take leaks for Battery B made in Construction Permit C808048.

c. 40 CFR 63.304(b)(2)(iii)

2.5 percent leaking off take system(s), as determined by the procedures in 40 CFR 63.309(d)(1).

7.2.3-5 Applicable Standards: Coke Oven Pushing

a. 35 IAC 212.443(c)(1)(A)

Emissions of uncaptured particulate matter from pushing operations shall not exceed an average of 20 percent opacity for 4 consecutive pushes considering the highest average of six consecutive readings in each push.

Compliance with this limit shall be determined in accordance with the procedures in 35 IAC 212.443(c)(1)(B) and Condition 7.2.12.

b. 35 IAC 212.443(c)(2)

i. The particulate emissions from control equipment used to control emissions during pushing operations shall not exceed 0.040 pounds per ton of coke pushed. Compliance shall be determined in accordance with the procedures set forth in 40 CFR Part 60, Appendix A, Methods 1-5, incorporated by reference in Section 212.113. Compliance shall be based on an arithmetic average of three runs (stack tests) and the

calculations shall be based on the duration of a push as defined in 35 IAC 212.443(c)(1)(A).

ii. The opacity of emissions from control equipment used to control emissions during pushing operations shall not exceed 20%. For a push of less than six minutes duration, the actual number of 15-second readings taken shall be averaged. Compliance shall be determined in accordance with 40 CFR Part 60, Appendix A, Method 9, incorporated by reference in 35 IAC 212.113, Section 2.5 of 40 CFR Part 60, Appendix A, Method 9, incorporated by reference in 35 IAC 212.113, for data reduction shall not be used for pushes of less than six minutes duration [35 IAC 212.443(c)(2)(B)].

c. 40 CFR 63.7290(a)(4)

Particulate matter emissions to the atmosphere from the mobile scrubber car for pushing which captures emissions during travel shall not exceed 0.04 lb/ton of coke.

d. Battery B

Pushing emissions from Battery B shall be captured and cleaned by a single-spot, coke guide evacuated, enclosed quench car/scrubber car system which meets the following limitations [T1]:

i. The gas cleaning device shall be operated to meet 0.04 pounds of particulate matter per ton of coke pushed during the pushing operation.

ii. Visible emissions from the gas cleaning device outlet and uncaptured fugitive emissions shall not exceed 20 percent opacity.

Note: These limits are the determination of LAER for pushing emissions from Battery B made in Construction Permit C808048.

7.2.3-6 Applicable Standards: Coke Quenching

a. i. 40 CFR 63.7295(a)(1)(i)

For the quenching of hot coke, the Permittee must meet the following requirements of 40 CFR 63.7295(a)(1)(i):

The concentration of total dissolved solids (TDS) in the water used for quenching must not exceed 1,100 milligrams per liter (mg/L).

ii. 40 CFR 63.7295(a)(2)

The Permittee must use acceptable makeup water, as defined in 40 CFR 63.7352, as makeup water for quenching.

iii. 40 CFR 63.7295(b)

For each quench tower at a coke oven battery, the Permittee must meet each of the following requirements:

A. Pursuant to 40 CFR 63.7295(b)(1), each tower is equipped with baffles such that no more than 5 percent of the cross sectional area of the tower may be uncovered or open to the sky;

B. Pursuant to 40 CFR 63.7295(b)(2), baffles in each quench tower shall be washed once each day that the tower is used to quench coke, except as specified below:

1. Baffles in a quench tower are not required to be washed if the highest measured ambient temperature remains less than 30 degrees Fahrenheit throughout that day (24-hour period). If the measured ambient temperature rises to 30 degrees Fahrenheit or more during the day, the Permittee shall resume daily washing.

2. The Permittee shall continuously record the ambient temperature on days that the baffles were not washed.

C. Pursuant to 40 CFR 63.7295(b)(3) and (4), the Permittee shall comply with inspection and repair provisions (see Condition 7.2.8-3).

b. 35 IAC 212.443(h)(1)

All coke oven quench towers shall be equipped with grit arrestors or equipment of comparable effectiveness. Baffles shall cover 95 percent or more of the cross sectional area of the exhaust vent or stack and must be maintained. Quench water shall not include untreated coke by-product plant effluent. All water placed on the coke being quenched shall be quench water.

c. 35 IAC 212.443(h)(2)

Total dissolved solids concentrations in the quench water shall not exceed a weekly average of 1200 mg/L.

7.2.3-7 Applicable Standards: Combustion (Battery) Stack

a. 35 IAC 212.443(g)

i. No person shall cause or allow the emissions of particulate matter from a coke oven combustion stack to exceed 110 mg/dscm (0.05 gr/dscf); and

ii. No person shall cause or allow the emission of particulate matter from a coke oven combustion stack to exceed 30% opacity. Compliance shall be determined in accordance with 40 CFR Part 60, Appendix A, Method 9, incorporated by reference in 35 IAC 212.113. However, the opacity limit shall not apply to a coke oven combustion stack when a leak between any coke oven and the oven's vertical or crossover flues is being repaired, after pushing coke from the oven is completed, but before resumption of charging. The exemption from the opacity limit shall not exceed three (3) hours per oven repaired. The owner or operator shall keep written records identifying the oven repaired, and the date, time, and duration of all repair periods. These records shall be subject to the requirements of 35 IAC 212.324(g)(4) and (g)(5).

b. 40 CFR 63.7296

The Permittee must not discharge to the atmosphere any emissions from any battery stack at an existing by-product coke oven battery that exhibits opacity greater than the following applicable limits:

i. Daily average of 15 percent opacity for a battery on a normal coking cycle.

ii. Daily average of 20 percent opacity for a battery on batterywide extended coking.

c. Battery B

Pursuant to Construction Permit 82060043, non-sulfate particulate matter emissions from the battery stack serving Battery B shall not exceed 0.03 gr/dscf [T1].

7.2.3-8 Applicable Standards: Bypass/Bleeder Stack

a. i. Pursuant to 40 CFR 63.307(a)(1), the Permittee shall operate and properly maintain a bypass/bleeder stack flare system that is capable of controlling 120 percent of the normal gas flow generated by the affected battery.

ii. Coke oven emissions shall not be vented to the atmosphere through bypass/bleeder stacks, except

through the flare system or an alternative control device as described in 40 CFR 63.307(d) [40 CFR 63.307(a)(2)].

iii. Each flare installed pursuant to 40 CFR 63.307 shall meet the applicable requirements specified by 40 CFR 63.307(b) with compliance determined as specified by 40 CFR 63.309(h).

b. Pursuant to 40 CFR 63.307(c), the flare shall be operated with no visible emissions, as determined by the methods specified in 40 CFR 63.309(h)(1), except for periods not to exceed a total of 5 minutes during any 2 consecutive hours.

7.2.4 Non-Applicability of Regulations of Concern

a. The emission limitations of 35 IAC 212.324 are not applicable to any emission unit subject to a specific emissions standard or limitation contained in 35 IAC Part 212 Subpart R, Primary and Fabricated Metal Products and Machinery Manufacture, pursuant to 35 IAC 212.324 (a)(3).

b. The affected coke oven operations are not fuel combustion emission units as defined in 35 IAC 211.2470 and therefore are not subject to the standards for fuel combustion emission units in 35 IAC Parts 212, 214, 216 and 217.

c. This permit is issued based on the affected coke oven operations not being subject to the applicable requirements of 35 IAC 219.301 because there is 85 percent reduction of uncontrolled organic material that would otherwise be emitted into atmosphere, pursuant to 35 IAC 219.302.

7.2.5-1 Work Practices: Soaking Plan (40 CFR 63.7294)

Pursuant to 40 CFR 63.7294(a), the Permittee shall operate the coke ovens pursuant to a written work practice plan for soaking, which includes the measures specified by 40 CFR 63.7294(a), including, if soaking emissions are caused by leaks from the collecting main, the Permittee shall take corrective actions to eliminate soaking emissions in accordance with the actions identified in the soaking plan. If soaking emissions are not caused by leaks, the Permittee must determine whether the soaking emissions are due to incomplete coking. If incomplete coking is the cause of the soaking emissions, the Permittee must put the oven back on the collecting main until it is completely coked or the Permittee must ignite the standpipe emissions as specified by 40 CFR 63.7294(a)(4) and (5).

7.2.5-2 Work Practice Plan (40 CFR 63.306)

a. Pursuant to 40 CFR 63.306(c), for affected units subject to the NESHAP, 40 CFR 63 Subpart L, the Permittee shall implement a written emission control Work Practice Plan for each affected coke oven battery designed to achieve

compliance with visible emission limitations for coke oven doors, topside port lids, off take systems, and charging operations.

b. Pursuant to 40 CFR 63.306(a)(1) and (b), the Permittee shall organize the work practice plan to indicate clearly which parts of the plan pertain to each emission point subject to visible emission standards under 40 CFR Subpart L. Each of the following provisions, at a minimum, shall be addressed in the plan in sufficient detail and with sufficient specificity to allow USEPA and the Illinois EPA to evaluate the plan for completeness and enforceability:

i. An initial and refresher training program for all coke plant operating personnel with responsibilities that impact emissions, including contractors, in job requirements related to emission control and the requirements of 40 CFR Subpart L, including work practice requirements, that includes all the elements specified by 40 CFR 63.306(b)(1). Contractors with responsibilities that impact emission control may be trained by the Permittee or by qualified contractor personnel; however, the Permittee shall ensure that the contractor training program complies with the requirements of 40 CFR 63.306(b)(1).

ii. Procedures for controlling emissions from coke oven doors on by-product coke oven batteries, including the elements specified by 40 CFR 63.306(b)(2).

iii. Procedures for controlling emissions from charging operations on by-product coke oven batteries, including the elements specified by 40 CFR 63.306(b)(3).

iv. Procedures for controlling emissions from topside port lids on by-product coke oven batteries, including the elements specified by 40 CFR 63.306(b)(4).

v. Procedures for controlling emissions from off take system(s) on by-product coke oven batteries, including the elements specified by 40 CFR 63.306(b)(5).

vi. Procedures for each emission point subject to visible emission limitations under 40 CFR 63 Subpart L for maintaining a daily record of the performance of plan requirements pertaining to the daily operations of the affected coke oven operations as defined in Condition 7.2.3(c) and its emission control equipment, including the elements specified by 40 CFR 63.306(b)(7).

vii. Any additional work practices or requirements specified by the USEPA or Illinois EPA pursuant to 40 CFR 63.306(d).

c. Pursuant to 40 CFR 63.306(c) the Permittee shall implement the provisions of the work practice plan pertaining to a particular emission point:

i. Following the second independent exceedance of the visible emission limitation for the emission point in any consecutive 6-month period, by no later than 3 days after receipt of written notification of the second such exceedance from the certified observer. For this purpose, the second exceedance is "independent" if the criteria of 40 CFR 63.306(c)(1)(i)(A), (B) or (C) are met.

ii. And continue to implement such plan provisions until the visible emission limitation for the emission point is achieved for 90 consecutive days. After the visible emission limitation for a particular emission point is achieved for 90 consecutive days, any exceedances prior to the beginning of the 90 days are not included in making the above determination of exceedances.

d. Revisions to the work practice plan shall be done in accordance with 40 CFR 63.306(d) and (a)(2).

e. The Work Practice Plan, as submitted by the Permittee on November 12, 1993, (which contains various training and standard operating procedures for the A & B coke oven batteries), is incorporated herein by reference. The document constitutes the formal work practice plan required by 40 CFR 306(a) for each coke oven battery, addressing work practices for achieving compliance with the visible emissions limitations of Subpart L.

Any future revision to the aforementioned plan made by the Permittee during the permit term is automatically incorporated by reference provided that said revision is not expressly disapproved, in writing, by the Illinois EPA within 30 days of receipt of said revision. In the event that the Illinois EPA notifies the Permittee of a deficiency with any revision to the plan, the Permittee shall be required to revise and resubmit the plan within 30 days of receipt of notification to address the deficiency [Section 39.5(7)(a) of the Act].

7.2.5-3 NESHAP Provisions for Startup, Shutdown and Malfunction

a. Pursuant to 40 CFR 63.7310(a) and (c), for affected coke oven operations subject to 40 CFR 63 Subpart CCCCC:

i. The Permittee shall comply with the emission limitations, work practice standards, and operating and maintenance requirements of 40 CFR 63 Subpart CCCCC, at all times except periods of startup, shutdown, and malfunction as defined at 40 CFR 63.2.

ii. The Permittee shall develop and implement a written startup, shutdown and malfunction plan according to the provisions in 40 CFR 63.6(e)(3).

b. Pursuant to 40 CFR 63.310, for affected coke oven operations subject to 40 CFR 63 Subpart L:

i. At all times, including periods of startup, shutdown, and malfunction, the Permittee shall operate and maintain the affected coke oven operations, and associated pollution control equipment, in a manner consistent with good air pollution control practices for minimizing emissions to the levels required by standards under 40 CFR Subpart L. Failure to adhere to the requirement of 40 CFR 63.310 shall not constitute a separate violation if a violation of an applicable performance or work practice standard has also occurred [40 CFR 63.310(a)].

ii. The Permittee shall develop and implement according to 40 CFR 63.310(c), a written startup, shutdown, and malfunction plan that describes procedures for operating the affected units, including associated air pollution control equipment, during a period of a startup, shutdown, or malfunction in a manner consistent with good air pollution control practices for minimizing emissions, and procedures for correcting malfunctioning process and air pollution control equipment as quickly as practicable [40 CFR 63.310(b)].

iii. Pursuant to 40 CFR 63.310(c), during a period of startup, shutdown, or malfunction the Permittee shall operate the battery (including associated air pollution control equipment) in accordance with the procedure specified in the startup, shutdown, and malfunction plan; and malfunctions shall be corrected as soon as practicable after their occurrence, in accordance with the plan.

iv. To satisfy the requirement for a startup, shutdown, and malfunction plan, the Permittee may use the standard operating procedures manual for the battery, provided the manual meets all the requirements of 40 CFR 63.310 and is made available for inspection at reasonable times when requested by the Administrator (USEPA) or Illinois EPA, as provided by 40 CFR 63.310(g).

v. The USEPA or Illinois EPA may require reasonable revisions to a startup, shutdown, and malfunction plan as provided by 40 CFR 63.310(h).

vi. Pursuant to 40 CR 63.310((i), if the Permittee demonstrates to the satisfaction of the Administrator (USEPA and Illinois EPA) that a startup, shutdown, or malfunction has occurred, then an observation occurring during such startup, shutdown, or malfunction shall not:

A. Constitute a violation of relevant requirements of 40 CFR 63 Subpart L;

B. Be used in any compliance determination under 40 CFR 63.309; or

C. Be considered for purposes of 40 CFR 63.306 (the work practice plan), until the Administrator (USEPA and Illinois EPA) has resolved the claim that a startup, shutdown, or malfunction has occurred, as further provided by 40 CFR 63.310(i)(3).

vii. The Permittee shall maintain all records related to startup, shutdown and malfunction, including internal reports which form the basis of each malfunction notification under 40 CFR 63.310(d) as required by 40 CFR 63.310(f).

7.2.5-4 Startup Authorization Pursuant to State Rule

Pursuant to 35 IAC 201.149 and Part 201, Subpart I, subject to the following terms and conditions, for the affected coke ovens, the Permittee is authorized to violate the applicable standards in 35 IAC 212.443 during startup. For this purpose a start-up is the resumption of normal production following the period when the battery has been idled.

Note: This authorization is provided because the Permittee has applied for such authorization in its CAAPP application, generally describing the efforts that will be used "…to minimize startup emissions, duration of individual starts, and frequency of startups".

a. This authorization does not relieve the Permittee from the continuing obligation to demonstrate that all reasonable efforts are made to minimize startup emissions, duration of individual startups and frequency of startups.

b. The Permittee shall conduct startup of the affected coke oven operations in accordance with the manufacturer's written instructions or other written procedures prepared by the Permittee and maintained at the source (see

Condition 7.2.9(g)(i)), that are specifically developed to minimize emissions from the startup.

c. The Permittee shall fulfill applicable recordkeeping of Condition 7.2.9(g).

d. The Permittee shall fulfill applicable reporting of Condition 5.10.5-1.

e. As provided by 35 IAC 201.265, an authorization in a permit for excess emissions during startup does not shield a Permittee from enforcement for any violation of applicable emission standard(s) that occurs during startup and only constitutes a prima facie defense to such an enforcement action provided that the Permittee has fully complied with all terms and conditions connected with such authorization.

7.2.5-5 Malfunction and Breakdown Authorization Pursuant to State Rule

a. Pursuant to 35 IAC 201.149 and Part 201, Subpart I, subject to the following terms and conditions, the Permittee is authorized to continue operation of the affected coke oven batteries in excess of the applicable state standards in 35 IAC 212.443 in the event of a malfunction or breakdown.

Note: This authorization is provided because the Permittee applied for such authorization in its CAAPP application, generally explaining why such continued operation would be required to prevent injury to personnel or severe damage to equipment, and describing the measures that will be taken to minimize emissions from any malfunctions and breakdowns.

i. This authorization only allows such continued operation as necessary to prevent injury to personnel or severe damage to equipment and does not extend to continued operation solely for the economic benefit of the Permittee.

ii. Upon occurrence of excess emissions due to malfunction or breakdown, the Permittee shall repair the responsible affected coke oven operations or other responsible equipment and/or re-establish the applicable control practices (e.g., the rail system for quench car).

iii. The Permittee shall fulfill the applicable recordkeeping and reporting requirements of Conditions 7.2.9(h) and Condition 5.10.5-2, respectively. For these purposes, time shall be measured from the start of a particular incident. The absence of excess emissions for a short period shall not be considered to end the incident if excess emissions resume.

iv. Following notification to the Illinois EPA (see Condition 5.10.5-2(a)(i))of a malfunction or breakdown with excess emissions, the Permittee shall comply with all reasonable directives of the Illinois EPA with respect to such incident.

v. This authorization does not relieve the Permittee from the continuing obligation to minimize excess emissions during malfunction or breakdown. As provided by 35 IAC 201.265, an authorization in a permit for continued operation with excess emissions during malfunction and breakdown does not shield the Permittee from enforcement for any such violation and only constitutes a prima facie defense to such an enforcement action provided that the Permittee has fully complied with all terms and conditions connected with such authorization.

b. During the period when only one quench station is available (i.e., the other quench station is not operable because of construction work on a new quench tower) or there is a malfunction or breakdown preventing hot coke from being moved to a tower-equipped quench station (e.g., rail line malfunction), the Permittee is authorized to continue operation of the coke ovens with emergency quenching, i.e., quenching without a quench tower or at a quench station that is experiencing a malfunction or breakdown (see Condition 7.2.5-5).

7.2.6 Production and Emission Limitations

a. i. The amount of coal charged to the affected Battery “B” shall not exceed 454,000 tons per year [Construction Permit C808048].

b. i. Emissions of PM from the mobile scrubber cars for pushing shall not exceed 4.2 lb/hr and 18.3 t/yr [T1].

Compliance with annual limits shall be determined from a running total of 12 months of data [Construction Permit 88070071].

ii. Spare cars, parts inventories and maintenance practices shall be maintained and implemented by the Permittee for the pushing operations (quench cars and mobile scrubbers) consistent with good air pollution control practices [Permit 88070071].

c. i. Supplementary natural gas usage for the coke ovens shall not exceed 20 million scf/month and 123 million scf/yr [T1].

ii. Emissions attributable to the combustion of natural gas for the underfiring of the batteries shall not exceed the following limits. Compliance with the

annual limits shall be determined from a running total of 12 months of data [T1]:

	Emissions	
Pollutant	(Tons/Month)	(Tons/Year)
NO_x	2.80	17.22
CO	0.84	5.17
PM	0.12	0.73
PM_{10}	0.11	0.62
VOM	0.06	0.34
SO_2	0.01	0.04

iii. The above limitations were established in the Permit 04110018.

d. i. Once shakedown of the new quench tower on the West Quench Station has been completed, the Permittee shall use the West Quench Station preferentially. For this purpose, on an annual basis*, excluding periods when the West Quench Station cannot be used due to malfunction or breakdown, the East Quench Station shall not quench more than: 5 percent of the total number of quenches or 15,000 tons of coke, whichever is greater, not to exceed 30,000 tons of coke per year.

* This limit shall apply for the 12 month period from July 1 of one year through June 30 of the following year. This limit shall also apply for the initial 12 months following shakedown of the West Quench Station with new quench tower.

ii. Shakedown of each affected quench tower shall be completed within 180 days of the initial quench with each tower.

iii. The above limitations were established in the Permit 08060026.

7.2.7-1 Emission Testing for Coke Oven Pushing

a. Testing requirements established by 40 CFR Part 63 Subpart CCCCC:

i. Pursuant to 40 CFR 63.7321, for each control device subject to an emission limit for particulate matter in 40 CFR 63.7290(a), the Permittee must conduct performance tests no less frequently than twice (at mid-term and renewal) during each term of the CAAPP permit (i.e., every 30 months).

ii. The Permittee must conduct each performance test according to the following requirements in 40 CFR 63.7322.

A. To determine compliance with a process-weighted mass rate of particulate matter (lb/ton of coke) from a control device applied to pushing emissions where a cokeside shed is not used, follow these test methods and procedures to determine the concentration of particulate matter according to the following test methods in Appendix A to 40 CFR Part 60:

1. Method 1 to select sampling port locations and the number of traverse points. Sampling sites must be located at the outlet of the control device and prior to any releases to the atmosphere.

2. Method 2, 2F, or 2G to determine the volumetric flow rate of the stack gas.

3. Method 3, 3A, or 3B to determine the dry molecular weight of the stack gas.

4. Method 4 to determine the moisture content of the stack gas.

5. Method 5 or 5D, as applicable, to determine the concentration of front half particulate matter in the stack gas.

B. During each particulate matter test run, sample only during periods of actual pushing when the capture system fan and control device are engaged. Collect a minimum sample volume of 30 dry standard cubic feet of gas during each test run. Three valid test runs are needed to comprise a performance test. Each run must start at the beginning of a push and finish at the end of a push (*i.e.*, sample for an integral number of pushes).

C. Determine the total combined weight in tons of coke pushed during the duration of each test run according to the procedures in the Permittee’s source test plan for calculating coke yield from the quantity of coal charged to an individual oven.

D. Compute the process-weighted mass emissions (E_p) for each test run using the following equation:

$$E_p = \frac{C \times Q \times T}{P \times K} \qquad \text{(Eq. 1)}$$

Where:

E_p = Process weighted mass emissions of particulate matter, lb/ton;

C = Concentration of particulate matter, gr/dscf;

Q = Volumetric flow rate of stack gas, dscf/hr;

T = Total time during a run that a sample is withdrawn from the stack during pushing, hr;

P = Total amount of coke pushed during the test run, tons; and

K = Conversion factor, 7,000 gr/lb.

b. Testing requirements to address 35 IAC 212.443(c)(2)

If the PM emissions measured during the emissions testing conducted pursuant to Condition 7.2.7-1(a) are more than 0.036 lb/ton, the Permittee shall conduct a follow-up test between 12 and 18 months after such test, unless subsequent emission testing conducted in the 12 month period following such test shows PM emissions are no more than 0.030 lb/ton.

7.2.7-2 Testing Requirements for Coke Quenching

a. Requirements of 40 CFR Part 63 Subpart CCCCC

i. Pursuant to 40 CFR 63.7333(f), the Permittee shall sample and analyze quench water for total dissolved solids on at least a weekly basis in accordance with the procedures specified by 40 CFR 63.7325(a).

ii. If the Permittee elects to comply with the TDS limit for quench water in 40 CFR 63.7295(a)(1)(i), the Permittee must conduct each performance test that applies to the affected quenching operations according to the following conditions in 40 CFR 63.7325(a)(1) and (2):

A. Take the quench water sample from a location that provides a representative sample of the quench water as applied to the coke (e.g., from the header that feeds water to the quench tower reservoirs). Conduct sampling under normal and representative operating conditions.

B. Determine the TDS concentration of the sample using Method 160.1 in 40 CFR part 136.3 (see residue—filterable"), except that you must dry the total filterable residue at 103 to 105°C instead of 180°C.

b. Requirements of 35 IAC 212.443(h)

i. Pursuant to 35 IAC 212.443(h)(3), the quench water shall be sampled for total dissolved solids concentrations in accordance with the methods specified in Standard Methods for the Examination of Water and Wastewater, Section 209C, "Total Filterable Residue Dried at 103-105°C" 15th Edition, 1980, incorporated by reference in 35 IAC 212.113. Analyses shall be performed on grab samples of the quench water as applied to the coke in accordance with the sampling schedule in Condition 7.2.12(c).

ii. If the quench station is not used during any given calendar week, the grab samples for that quench station need not be analyzed.

c. Testing requirements for West Quench Station from Permit 08060026

Within two years after initial startup of the West Quench Station with low emission quench tower, the Permittee shall have emission test(s) conducted for this quench station at its expense as follows:

i. The emissions test(s) shall be designed to measure the PM, PM_{10}, and $PM_{2.5}$ emission rates (lb/ton coke) from the quench tower under conditions that are representative of the maximum emissions as the station is normally operated.

ii. The Permittee shall install any facilities necessary to accommodate this emissions testing.

iii. The following methods and procedures shall be used for testing emissions of PM unless other method(s) are approved by the Illinois EPA as part of its review of the test plan.

A. The following USEPA Test Methods:

Refer to 40 CFR 60, Appendix A for USEPA test methods and www.epa.gov/ttn/emc/prelim.html for other test methods.

Location of Sample Points	USEPA Method 1
Gas Flow and Velocity	USEPA Method 2
Flue Gas Weight	USEPA Method 3
Moisture	USEPA Method 4
PM	USEPA Method 5

B. Testing for emissions of filterable and condensable PM_{10} shall be conducted using an appropriate Test Method developed by USEPA, e.g., Method 201/201A or Other Test Method (OTM) 27 and Method 202 or OTM 28, or a Reference Method proposed by USEPA, subject to review by the Illinois EPA as part of the review of the test plan.

C. Testing for emissions of filterable $PM_{2.5}$ shall be conducted using an applicable Reference Method, as adopted by USEPA in 40 CFR Part 51, Appendix M, or in 40 CFR Part 60, Appendix A. If USEPA has not adopted a Reference Method for testing of filterable $PM_{2.5}$ when testing must be performed, testing for filterable $PM_{2.5}$ shall be conducted using an appropriate Test Method developed by USEPA, e.g., OTM 27, or a Reference Method proposed by USEPA, subject to review by the Illinois EPA as part of the review of the test plan.

iv. For this emission testing, test notification and reporting shall be done by the Permittee in accordance with Conditions 8.6.2 and 8.6.3 of this permit.

7.2.7-3 Compliance Demonstrations and Emission Testing for Coke Oven Underfiring (combustion stacks)

a. For compliance demonstration with opacity limits, the Permittee must conduct each performance test that applies to the affected operations according to the following requirements in 40 CFR 63.7324(b):

To determine compliance with the daily average opacity limit for stacks of 15 percent for a by-product coke oven battery on a normal coking cycle or 20 percent for a by-product coke oven battery on batterywide extended coking, follow the test methods and procedures outlined below:

i. Using the continuous opacity monitoring system (COMS) required in 40 CFR 63.7330(e), measure and record the

opacity of emissions from each battery stack for a 24-hour period.

ii. Reduce the monitoring data to hourly averages as specified in 40 CFR 63.8(g)(2).

iii. Compute and record the 24-hour (daily) average of the COMS data.

b. Pursuant to Sections 39.5(7)(d) and (p) of the Act, the Permittee shall conduct emission tests for each coke oven combustion stack under conditions that are representative of maximum emissions as follows:

i. Testing for PM emissions (filterable PM from Battery A and filterable and filterable non-sulfate PM from Battery B) shall be conducted as follows:

A. Initial testing shall be conducted within 24 months of the effective date of this permit condition.

B. Thereafter, emission testing shall be repeated in 30 months, unless the PM emission rate measured from both stacks during the previous testing is less than 0.040 gr/dscf for filterable PM and less than 0.024 gr/dscf for filterable non-sulfate PM from the combustion stack on Battery B, in which case testing shall be repeated in 60 months.

C. Testing shall also be conducted for combustion stack(s) upon written request from the Illinois EPA as specified in the request. This testing shall be completed within 90 days of the date of the request or such later date agreed to by the Illinois EPA.

ii. In conjunction with the initial testing for PM emissions required by Condition 7.2.7-3(b)(i)(A), the Permittee shall also test for CO and NO_x from one of the coke oven combustion stacks, as selected by the Illinois EPA.

iii. The following USEPA test methods shall be used for testing of emissions, unless another USEPA test method is approved by the Illinois EPA. Refer to 40 CFR 51, Appendix M, and 40 CFR 60, Appendix A, for test methods.

Location of Sample Points	Method 1
Gas Flow and Velocity	Method 2
Flue Gas Weight	Method 3
Moisture	Method 4

PM (filterable)	Method 5
PM (non-sulfate filterable)	Method 5F
CO	Method 10
NO_x	Method 7 or 7E

iv. For this emission testing, test notification and reporting shall be done by the Permittee in accordance with Conditions 8.6.2 and 8.6.3 of this permit.

v. With the report for emission testing, the Permittee shall also provide a summary of the opacity data monitored during the period of testing (6 minute averages and daily average), the sulfur content of COG being combusted during the period of testing, as measured by the monitoring system(s) for COG, the PM content of COG combusted during the period of testing, and data for the firing rate of the battery during testing (mmBtu or SCF of COG and natural gas per hour) for each test run, with supporting calculations.

c. Testing conditions above are established pursuant to Sections 39.5(7)(d) and (p) of the Act.

7.2.8-1 Monitoring Requirements for Charging, Doors, Lids and Off Takes

a. i. Pursuant to 40 CFR 63.309(a), daily performance tests shall be conducted by a certified observer each day, 7 days per week for the affected battery, as specified by 40 CFR 63.309, the results of which shall be used in accordance with procedures specified in 40 CFR 63 Subpart L to determine compliance with each of the applicable visible emission limitations for coke oven doors, topside port lids, off take systems, and charging operations in 40 CFR 63 Subpart L.

ii. The Permittee shall enter into a contract providing for the inspections and performance tests required under the NESHAP, 40 CFR 63 Subpart L, to be performed by a Method 303 certified observer. The inspections and performance tests will be conducted at the expense of the Permittee, during the period that the USEPA is the implementing agency [40 CFR 63.309(a)(5)(ii)].

A. The certified observer shall conduct daily performance tests according to the requirements specified in 40 CFR 63.309(c).

B. Pursuant to 40 CFR 63.309(c)(3), upon request of the certified observer the Permittee shall demonstrate pursuant to Reference Method 303 the accuracy of the pressure measurement device

for the collecting mains and shall not adjust the pressure to a level below the range of normal operation during or prior to the inspection.

C. In no case shall the owner or operator knowingly block a coke oven door, or any portion of a door for the purpose of concealing emissions or preventing observations by the certified observer, as prohibited by 40 CFR 63.309(c)(6).

D. 1. Pursuant to 40 CFR 63.309(e), the certified observer shall make available to the implementing agency, as well as to the Permittee, a copy of the daily inspection results by the end of the day and shall make available the calculated rolling average for each emission point to the Permittee as soon as practicable following each performance test. The information provided by the certified observer is not a compliance determination. For the purposes of notifying the owner or operator of the results obtained by a certified observer, the person does not have to be certified.

2. Pursuant to 40 CFR 63.306(d)(3), if the certified observer calculates that a second exceedance (or if applicable, a second independent exceedance) has occurred, the certified observer shall notify the Permittee. No later than 10 days after receipt of such notification, the Permittee shall notify the administrator (USEPA) and Illinois EPA of any finding of whether work practices are related to the cause or solution of the problem.

Note: Pursuant to 40 CFR 63.306(d)(6), the reviewing authority (USEPA) may disapprove the submitted finding if it determines that a revised work practice plan is needed to prevent exceedances of the applicable visible emission limitations.

iii. Pursuant to 40 CFR 63.309(f), compliance with the NESHAP, 40 CFR 63 Subpart L shall not be determined more often than the schedule provided for performance tests under 40 CFR 63.309. If additional valid emissions observations are obtained (or in the case

of charging, valid sets of emission observations), the arithmetic average of all valid values (or valid sets of values) obtained during the day shall be used in any computations performed to determine compliance under 40 CFR 63.309(d) or determinations under 40 CFR 63.306.

iv. Pursuant to 40 CFR 63.309(i), no observations obtained during any program for training or for certifying observers under 40 CFR 63 Subpart L shall be used to determine compliance with the requirements of 40 CFR 63 Subpart L or any other federally enforceable standard.

b. Pursuant to 40 CFR 63.308, for the collecting mains, the Permittee shall conduct daily inspections for leaks and promptly repair any leaks as specified by 40 CFR 63.308(a) through (d).

c. Pursuant to Section 39.5(7)(d) of the Act, the Permittee shall have daily inspections conducted for charging and doors, lids and off takes to confirm compliance by Battery A with 35 IAC 212.443(b), (d), (e) and (f) and by Battery B with LAER limit (See Conditions 7.2.3-1(c), 7.2.3-2(b), 7.2.3-3(b), and 7.2.3-4(b)). These inspections shall be conducted in accordance with applicable procedures in Condition 7.2.12(a). These inspections may be coordinated with the daily inspections required by the NESHAP, provided that appropriate observations are made and collected to address these applicable limits under state rule and permit.

7.2.8-2 Monitoring Requirements for Pushing

a. Pursuant to 40 CFR 63.7330(b), For each venturi scrubber applied to pushing emissions, the Permittee must at all times monitor the pressure drop and water flow rate using a CPMS according to the following requirements:

Pursuant to 40 CFR 63.7331(e), operate, and maintain CPMS to measure and record the pressure drop across the scrubber and scrubber water flow rate during each push according to the requirements in the site specific monitoring plan as well as the following:

i. Each CPMS must complete a measurement at least once per push [40 CFR 63.7331(e)(1)];

ii. Each CPMS must produce valid data for all pushes [40 CFR 63.7331(e)(2)]; and

iii. Each CPMS must determine and record the daily (24-hour) average of all recorded readings [40 CFR 63.7331(e)(3)].

b. Pursuant to 40 CFR 63.7330(d), For each capture system applied to pushing emissions, the Permittee must at all times operate and maintain a device to measure the fan RPM.

c. Pursuant to 40 CFR 63.7331(b), the Permittee must maintain and make available for inspection upon request by the Illinois EPA and USEPA a site-specific monitoring plan for each Continuous Parameter Monitoring System (CPMS) that addresses the following requirements:

   i. Installation of the CPMS sampling probe or other interface at a measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (*e.g.*, on or downstream of the last control device) [40 CFR 63.7331(b)(1)];

   ii. Performance and equipment specifications for the sample interface, the parametric signal analyzer, and the data collection and reduction system [40 CFR 63.7331(b)(2)];

   iii. Performance evaluation procedures and acceptance criteria (*e.g.*, calibrations) [40 CFR 63.7331(b)(3)];

   iv. Ongoing operation and maintenance procedures in accordance with the general requirements of 40 CFR 63.8(c)(1), (3), (4)(ii), (7), and (8) [40 CFR 63.7331(b)(4)];

   v. Ongoing data quality assurance procedures in accordance with the general requirements of 40 CFR 63.8(d) [40 CFR 63.7331(b)(5)]; and

   vi. Ongoing recordkeeping and reporting procedures in accordance with the general requirements of 40 CFR 63.10(c), (e)(1), and (e)(2)(i) [40 CFR 63.7331(b)(6)].

d. Pursuant to 40 CFR 63.7331(d), the Permittee must operate and maintain the CPMS in continuous operation according to the site-specific monitoring plan.

e. Pursuant to 40 CFR 63.7332(a), except for monitor malfunctions, associated repairs, and required quality assurance or control activities (including as applicable, calibration checks and required zero and span adjustments), you must monitor continuously (or collect data at all required intervals) at all times the affected source is operating.

f. Pursuant to 40 CFR 63.7332(b), the Permittee may not use data recorded during monitoring malfunctions, associated repairs, and required quality assurance or control activities in data averages and calculations used to report emission or operating levels, or in fulfilling a minimum data availability requirement, if applicable. You must use all the data collected during all other periods in assessing compliance. A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the monitor to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions.

g. Pursuant to 40 CFR 63.7333(d)(3)(ii), check the fan RPM at least every 8 hours to verify the daily average fan RPM is at or above the minimum level in Condition 7.2.8-2(h) and recording the results of each check.

h. i. Pursuant to 40 CFR 63.7290(b)(1), for each venturi scrubber applied to pushing emissions, the Permittee must maintain the daily average pressure drop and scrubber water flow rate at or above (no lower than) the following minimum levels established as the site-specific operating limits during testing:

PCS Car	Scrubber Water Flow Rate, gal/min	Pressure Drop, in. wc
#3	860	37
#4	607	33

ii. Pursuant to 40 CFR 63.7290(b)(3)(ii), for each capture system the Permittee must maintain the daily average fan revolutions per minute (RPM) at or above (no lower than) the minimum level established as the site-specific operating limits during testing:

PCS Car	RPM
#3	1650
#4	1743

iii. Pursuant to 40 CFR 63.7323 (e)(1) through (3), the Permittee may change the operating limit for a venturi scrubber, capture system, or mobile control device that captures emissions during pushing if the Permittee meets the following requirements described below:

A. Submit a written notification to the Illinois EPA of Permittee’s request to conduct a new performance test to revise the operating limit.

B. Conduct a performance test to demonstrate that emissions of particulate matter from the

control device do not exceed the applicable limit in 40 CFR 63.7290(a).

C. Establish revised operating limits according to the applicable procedures in 40 CFR 63.7323.

i. The Permittee shall comply with the work practice standards for fugitive pushing emissions as specified by 40 CFR 63.7291. In particular:

i. The Permittee shall observe and record the opacity of fugitive pushing emissions as required by 40 CFR 63.7291(a)(1), (a)(2), (a)(3) and (a)(4).

ii. The Permittee shall undertake corrective action(s) in the event that the opacity of fugitive pushing emissions exceeds the applicable limit, as required by 40 CFR 63.7291(a)(5) through (a)(7).

iii. Pursuant to 40 CFR 63.7291(b), the Permittee may request to use an alternative to the work practice standards in 40 CFR 63.7291(a) using the procedure provided in 40 CFR 63.6(g).

j. For each by-product coke oven battery with vertical flues subject to the work practice standards for fugitive pushing emissions in 40 CFR 63.7291(a), the Permittee must demonstrate continuous compliance according to the following requirements of 40 CFR 63.7334(a)(1) through (8):

i. The Permittee shall observe and record the opacity of fugitive emissions for four consecutive pushes per operating day, except the Permittee may make fewer or non-consecutive observations as permitted by 40 CFR 63.7291(a)(3). The Permittee shall maintain records of the pushing schedule for each oven and records indicating the legitimate operational reason for any change in the pushing schedule according to 40 CFR 63.7291(a)(4).

ii. The Permittee shall observe and record the opacity of fugitive emissions from each oven in a battery at least once every 90 days. If an oven cannot be observed during a 90-day period, the Permittee shall observe and record the opacity of the first push of that oven following the close of the 90-day period that can be read in accordance with the procedures in 40 CFR 63.7334(a)(1) through (8).

iii. The Permittee shall make all observations and calculations for opacity observations of fugitive pushing emissions in accordance with Method 9 in appendix A to 40 CFR Part 60 using a Method 9

certified observer unless the Permittee has an approved alternative procedure under 40 CFR 63.7334(a)(7).

iv. The Permittee shall record pushing opacity observations at 15-second intervals as required in section 2.4 of Method 9 Appendix A to 40 CFR Part 60. The following requirements do not apply: (section 2.4 of Method 9) for a minimum of 24 observations; the data reduction requirements in (section 2.5 of Method 9); and obtaining at least 3 hours of observations (thirty 6-minute averages) to demonstrate initial compliance (40 CFR 63.6(h)(5)(ii)(B)) does not apply.

v. If fewer than six but at least four 15-second observations can be made, the Permittee shall use the average of the total number of observations to calculate average opacity for the push. Missing one or more observations during the push (*e.g.*, as the quench car passes behind a building) does not invalidate the observations before or after the interference for that push. However, a minimum of four 15-second readings must be made by the Permittee for a valid observation.

vi. The Permittee shall begin observations for a push at the first detectable movement of the coke mass. The Permittee shall end observations of a push when the quench car enters the quench tower.

A. For a battery without a cokeside shed, the Permittee shall observe fugitive pushing emissions from a position at least 10 meters from the quench car that provides an unobstructed view and avoids interferences from the topside of the battery. This may require the observer to be positioned at an angle to the quench car rather than perpendicular to it. Typical interferences for the observer to avoid include emissions from open standpipes and charging. Opacity of emissions shall be observed above the battery top with the sky as the background where possible. The Permittee shall record the oven number of any push not observed because of obstructions or interferences.

B. An observer may reposition after the push to observe emissions during travel if necessary.

vii. If it is infeasible to implement the procedures in 40 CFR 63.7334 (a)(1) through (6) for an oven due to physical obstructions, nighttime pushes, or other reasons, the Permittee may apply to an appropriate permitting authority (USEPA) for permission to use an alternative procedure. The application must provide a detailed explanation of why it is infeasible to use the procedures in 40 CFR 63.7334 (a)(1) through (6), identify the oven and battery numbers, and describe the alternative procedure. An alternative procedure must identify whether the coke in that oven is not completely coked, either before, during, or after an oven is pushed.

viii. For each oven observed that exceeds an opacity of 30 percent for any short battery, the Permittee must take corrective action and/or increase the coking time in accordance with 40 CFR 63.7291(a). The Permittee shall maintain records documenting conformance with the requirements in 40 CFR 63.7291(a).

k. Pursuant to Section 39.5(7)(d) of the Act, the Permittee shall have daily observations conducted for pushing to confirm compliance with 35 IAC 212.443(c)(1)(A) (Condition 7.2.3-5(a)). These observations shall be conducted in accordance with applicable procedures in Condition 7.2.12(b). These observations may be coordinated with the observations required by the NESHAP provided that appropriate observations are made and data collected to address the applicable standard under state rule. These observations shall also include, on a monthly basis, opacity observations for the stack of the mobile scrubber car.

l. For each coke oven battery with a capture system or control device applied to pushing emissions, the Permittee shall demonstrate continuous compliance with the operation and maintenance requirements in 40 CFR 63.7300(c) by meeting the following requirements outlined in 40 CFR 63.7335(b):

i. Making monthly inspections of capture systems according to 40 CFR 63.7300(c)(1) and recording all information needed to document conformance with these requirements; and

ii. Performing preventative maintenance for each control device according to 40 CFR 63.7300(c)(2) and recording all information needed to document conformance with these requirements.

7.2.8-3 Monitoring Requirements for Quenching

a. For each coke oven battery subject to the work practice standard for quenching in 40 CFR 63.7295(b), the Permittee must demonstrate continuous compliance according to the following requirements of 40 CFR 63.7334(e)(1) through (3):

i. Maintaining baffles in each quench tower such that no more than 5 percent of the cross-sectional area of the tower is uncovered or open to the sky as required in 40 CFR 63.7295(b)(1);

ii. Maintaining records that document conformance with the washing, inspection, and repair requirements in 40 CFR 63.7295(b)(2), including records of the ambient temperature on any day that the baffles were not washed; and

iii. Maintaining records of the source of makeup water to document conformance with the requirement for acceptable makeup water in 40 CFR 63.7295(a)(2).

b. Pursuant to 40 CFR 63.7295(b), for the quench tower, the Permittee shall perform inspections on at least a monthly basis for damaged or missing baffles and initiate repair or replacement within 30 days, which shall be completed as soon as practicable, as specified by 40 CFR 63.7295(b)(3) and (4).

7.2.8-4 Monitoring Requirements for Combustion Stacks

a. Pursuant to 40 CFR 63.7330(e), for each coke oven battery stack, the Permittee must operate and maintain a COMS to measure and record the opacity of emissions exiting each stack according to the requirements in 40 CFR 63.7331(j)(1) through (5) and the following below:

i. The Permittee must operate, and maintain each COMS according to the requirements in 40 CFR 63.8(e) and Performance Specification 1 in 40 CFR Part 60, Appendix B. The Permittee shall identify periods the COMS is out-of-control, including any periods that the COMS fails to pass a daily calibration drift assessment, quarterly performance audit, or annual zero alignment audit.

ii. The Permittee must conduct a performance evaluation of each COMS according to the requirements in 40 CFR 63.8 and Performance Specification 1 in Appendix B to 40 CFR Part 60.

iii. The Permittee must develop and implement a quality control program for operating and maintaining each

COMS according to the requirements in 40 CFR 63.8(d). At minimum, the quality control program must include a daily calibration drift assessment, quarterly performance audit, and an annual zero alignment audit of each COMS.

iv. Each COMS installed, operated and maintained by the Permittee must complete a minimum of one cycle of sampling and analyzing for each successive 10-second period and one cycle of data recording for each successive 6-minute period. The Permittee must reduce the COMS data as specified in 40 CFR 63.8(g)(2).

v. The Permittee must determine and record the hourly and daily (24-hour) average opacity according to the procedures in 40 CFR 63.7324(b) using all the 6-minute averages collected for periods during which the COMS is not out-of-control.

b. Pursuant to Sections 39.5(7)(d) and (p) of the Act, the Permittee shall also record 6-minute average opacity data from the COMS required by Condition 7.2.8-4(a).

7.2.8-5 Monitoring Requirements for Emergency By-pass Bleeder Stacks

Pursuant to 40 CFR 63.309(h)(1), for a flare installed to meet the requirements of 40 CFR 63.307(b) (see Condition 7.2.3-8(b)):

If any emergency by-pass bleeder stack flare operates more than 5 minutes (cumulative) during any 2 hour period, visible emissions observations shall be conducted by using Method 22 in Appendix A of 40 CFR Part 60.

7.2.9 Recordkeeping Requirements

The Permittee shall maintain records of the following items for the affected coke production operations, pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. 40 CFR 63, Subpart CCCCC (40 CFR 63.7334(d))

For each by-product coke oven battery subject to the work practice standard for soaking in 40 63.7294(a), the Permittee must demonstrate continuous compliance by maintaining records that document conformance with requirements in 40 CFR 63.7294(a)(1) through (5).

b. 40 CFR 63, Subpart CCCCC (40 CFR 63.7342 and 63.7343)

i. The Permittee shall keep the following records specified in 40 CFR 63.7342 (a)(1) through (3):

A. A copy of each notification and report that the Permittee submitted to comply with 40 CFR 63 Subpart CCCCC, including all documentation supporting any initial notification or notification of compliance status that the Permittee submitted, according to the requirements in 40 CFR 63.10(b)(2)(xiv).

B. The records in 40 CFR 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction.

C. Records of performance tests, performance evaluations, and opacity observations as required in 40 CFR 63.10(b)(2)(viii).

ii. For each COMS or CEMS, the Permittee shall keep the following records specified in 40 CFR 63.7342(b)(1) through (4):

A. Records described in 40 CFR 63.10(b)(2)(vi) through (xi).

B. Monitoring data for COMS during a performance evaluation as required in 40 CFR 63.6(h)(7)(i) and (ii).

C. Previous (that is, superseded) versions of the performance evaluation plan as required in 40 CFR 63.8(d)(3).

D. Records of the date and time that each deviation started and stopped, and whether the deviation occurred during a period of startup, shutdown, or malfunction or during another period.

iii. The Permittee shall keep the records in 40 CFR 63.6(h)(6) for visual observations [40 CFR 63.7342(c)].

iv. The Permittee shall keep the records required in 40 CFR 63.7333 through 63.7335 to show continuous compliance with each emission limitation, work practice standard, and operation and maintenance requirement that applies to the Permittee [40 CFR 63.7342(d)].

v. The Permittee shall keep its records in a form suitable and readily available for expeditious review, according to 40 CFR 63.10(b)(1) [40 CFR 63.7343(a)].

vi. As specified in 40 CFR 63.10(b)(1), the Permittee shall keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record [40 CFR 63.7343(b)].

vii. The Permittee shall keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to 40 CFR 63.10(b)(1). The Permittee may keep the records offsite for the remaining 3 years [40 CFR 63.7343(c)].

c. 40 CFR 63, Subpart CCCCC (40 CFR 63.7326)

i. Pursuant to 40 CFR 63.7326(a)(2), For each venturi scrubber applied to pushing emissions, the Permittee shall have a record of the pressure drop and scrubber water flow rate measured during the performance test in accordance with 40 CFR 63.7323(a).

ii. Pursuant to 40 CFR 63.7326(a)(4)(iii), For each capture system applied to pushing emissions, the Permittee shall have a record of the fan RPM measured during the performance test in accordance with 40 CFR 63.7323(c)(3).

d. 40 CFR Part 63, Subpart L (40 CFR 63.311(f) and (g))

The Permittee shall maintain files of all required information in a permanent form suitable for inspection at an onsite location for at least 1 year and must thereafter be accessible within 3 working days to the Administrator for the time period specified in 40 CFR 70.6(a)(3)(ii)(B). Copies of the work practice plan developed under 40 CFR 63.306 and the startup, shutdown, and malfunction plan developed under 40 CFR 63.310 shall be kept onsite at all times. The Permittee shall maintain the following information:

i. A copy of the work practice plan required by 40 CFR 63.306 and any revision to the plan [40 CFR 63.311(f)(3)];

ii. If the Permittee is required under 40 CFR 63.306I to implement the provisions of a work practice plan for a particular emission point, the following records shall be maintained by the Permittee regarding the implementation of plan requirements for that emission point during the implementation period [40 CFR 63.311(f)(4)]:

A. Copies of all written and audiovisual materials used in the training, the dates of each class, the names of the participants in each class, and documentation that all appropriate personnel have successfully completed the training required under 40 CFR 63.306(b)(1);

B. The records required to be maintained by the plan provisions implementing 40 CFR 63.306(b)(7);

C. Records resulting from audits of the effectiveness of the work practice program for the particular emission point, as required under 40 CFR 63.306(b)(2)(i), 63.306(b)(3)(i), 63.306(b)(4)(i), or 63.306(b)(5)(i); and

D. If the plan provisions for coke oven doors must be implemented, records of the inventory of doors and jambs as required under 40 CFR 63.306(b)(2)(vi).

iii. The design drawings and engineering specifications for the bypass/bleeder stack flare system or approved alternative control device or system as required under 40 CFR 63.307 [40 CFR 63.311(f)(5)].

iv. Records specified in 40 CFR 63.310(f) regarding the basis of each malfunction notification [40 CFR 63.311(f)(6)].

v. Records required to be maintained and reports required to be filed with the Illinois EPA under Subpart L shall be made available in accordance with the requirements of 40 CFR 63.311(g) by the Permittee to the authorized collective bargaining representative of the employees at a coke oven battery, for inspection and copying.

A. Requests under 40 CFR 63.311(g) shall be submitted in writing, and shall identify the records or reports that are subject to the request with reasonable specificity;

B. The Permittee shall produce the reports for inspection and copying within a reasonable period of time, not to exceed 30 days. A reasonable fee may be charged for copying (except for the first copy of any document), which shall not exceed the copying fee charged by the Illinois EPA under the Act;

C. Nothing in 40 CFR 63.311(g) shall require the production for inspection or copying of any portion of a document that contains trade secrets or confidential business information that the Illinois EPA would be prohibited from disclosing to the public under the Act; and

D. The inspection or copying of a document under 40 CFR 63.311(g) shall not in any way affect any property right of the owner or operator in such document under laws for the protection of intellectual property, including the copyright laws.

e. Implementation of the good air pollution control practices, as required by Condition 7.2.5-3(b)(i), shall be supported by maintaining logs or other records for the implementation of operation practices and for maintenance activities performed by Permittee.

f. Records of the total annual coke production at batteries “A” and “B” (ton/yr) and separately for the Battery B [39.5(7)(b) of the Act].

g. Records for Startups of Affected coke ovens, pursuant to Section 39.5(7)(b) of the Act

i. The Permittee shall maintain startup procedures for each affected coke oven, as required by Condition 7.2.5-4(b).

ii. The Permittee shall maintain the following records for each startup of an affected coke oven:

A. Date, time and duration of the startup.

B. A description of the startup and reason(s) for the startup.

C. Whether a violation of an applicable standard may have occurred during startup accompanied by the information in Condition 7.2.9(g)(iv) if a violation may have or did occur.

D. Whether the established startup procedures, maintained above, were followed accompanied by the information in Condition 7.2.9(g)(iii) if there were departure(s) from those procedures.

iii. If the established startup procedures were not followed during a startup, the Permittee shall maintain the following records:

A. A description of the departure(s) from the established procedures.

B. The reason(s) for the departure(s) from the established procedures.

C. An explanation of the consequences of the departure(s) for emissions, such as whether the departure(s) prolonged the startup or resulted in additional emissions, and if so:

1. The actions taken to minimize emissions and the duration of the startup; and

2. An explanation whether similar incidents might be prevented in the future and if so, the corrective actions taken or to be taken to prevent similar incidents.

iv. If a violation did or may have occurred during a startup, the Permittee shall maintain the following records:

A. Identification of the applicable standard(s) that were or may have been violated.

B. An explanation of the nature of such violation(s), including the magnitude of such excess emissions.

C. A description of the actions taken to minimize the magnitude of emissions and duration of the startup.

D. An explanation whether similar incidents could be prevented or ameliorated in the future and if so, a description of the actions taken or to be taken to prevent similar incidents in the future.

h. Records for Malfunctions or Breakdowns

Pursuant to 35 IAC 201.263, the Permittee shall maintain records of continued operation of the affected coke ovens as addressed by Condition 7.2.5-4, during malfunctions or breakdowns, which at a minimum, shall include the following records. The preparation of these records shall be completed within 45 days of an incident, unless the Permittee conducts a root cause analysis for the incident, in which case the preparation of these records, other than

the root cause analysis, shall be completed within 120 days of the incident.

i. Date, time and duration of the incident.

ii. A detailed description of the incident, including:

A. A chronology of significant events during and leading up to the incident.

B. Relevant operating data for the unit, including information such as operator log entries and directives provided by management during the incident.

C. The measures taken to reduce the quantity of emissions and the duration of the incident including the resources utilized to address the incident.

D. The magnitude of emissions during the incident.

iii. An explanation why continued operation of an affected coke oven was necessary to prevent personnel injury or prevent equipment damage.

iv. A discussion of the cause(s) or probable cause(s) of the incident including the following:

A. Whether the incident was sudden, unavoidable, or preventable, including:

1. Why the equipment design did not prevent the incident;

2. Why better maintenance could not have avoided the incident;

3. Why better operating practices could not have avoided the incident; and

4. Why there was no advance indication for the incident.

B. Whether the incident stemmed from any activity or event that could have been foreseen, avoided or planned for,

C. Whether the incident was or is part of a recurring pattern indicative of inadequate design, operation or maintenance.

v. A description of any steps taken to prevent similar future incidents or reduce their frequency and severity.

vi. As an alternative to keeping the records required by Condition 7.2.9(h)(iv), the Permittee may perform a root cause analysis. For this purpose, a root cause analysis is an analysis whose purpose is to determine, correct and eliminate the primary causes of the incident and the excess emissions resulting there from. If the Permittee performs a root cause analysis method that would define the problem, define all causal relationships, provide a causal path to the root cause, delineate the evidence, and provide solutions to prevent a recurrence. Such an analysis shall be completed within one year of the incident.

i. Quench stations

The Permittee shall maintain the following records for quenching operations:

i. A file listing the emissions factors used by the Permittee to determine the emissions of the various quenching operations, with supporting documentation and analysis. These records shall be prepared and copies sent to the Illinois EPA in accordance with Condition 5.9.6(c).

ii. Records for the total number of quenches (ovens pushed), the total amount of coke quenched (tons) and the average amount of coke per quench (tons/quench) on a monthly and annual basis*.

iii. A log showing each period of time when coke was quenched at the East Quench Station, with number of quenches during the period and explanation of reason for use of the East Quench Station.

iv. Records on an annual basis* for the:

A. Total number of quenches.

B. For the East Quench Station:

1. Total number of quenches and amount of coke quenched at the East Quench Station.

2. Total number of quenches and amount of coke quenched at the East Quench Station due to malfunction and breakdown.

3. Percentage of total quenches that occurred at the East Quench Station.

C. For the emergency quench station:

1. Total number of quenches and amount of coke quenched at the emergency quench station.

2. Percentage of total quenches that occurred at the emergency quench station.

* These records shall be kept for the 12-month period from July 1 to June 30 and the initial 12-month period following shakedown of the West Quench Station with new quench tower.

v. Records for emissions of PM, PM_{10}, and $PM_{2.5}$ from each affected quench station and from the emergency quench station (tons/month and tons/year), with supporting calculations.

j. i. A file containing the emission rates (lb/hr and lb/ton) used by the Permittee to determine PM emissions from the mobile quench cars, with supporting documentation, which rates shall be reviewed when new data becomes available to assure that these rates do not understate actual emissions. These records shall be prepared and copies sent to the Illinois EPA in accordance with Condition 5.9.6(c).

ii. Records of PM emissions of the mobile scrubber cars (tons/month and tons/year), with supporting calculations.

k. i. Monthly and annual records of supplementary natural gas usage (scf) for underfiring the coke oven batteries and associated emissions (tons) with supporting calculations.

ii. Records of emissions as addressed in Condition 7.2.6(c).

l. Records of observations of duration of charging, percentage of leaks or opacity that are conducted by the Permittee or on its behalf to determine compliance with 35 IAC 212.443(b) and (c)(1)(A) in addition to the observations required by Condition 7.2.8-1 and 7.2.8-2.

m. Records of all test reports and submittals related to emission testing required by Section 7.2 of this permit.

7.2.10 Reporting Requirements

a. Opacity Monitoring Reports for Combustion Stacks

Pursuant to Sections 39.5(7)(a), (d) and (p) of the Act, the Permittee shall provide the following reports for each coke oven battery to the Illinois EPA, including a copy directly to Collinsville Regional Office, on a quarterly basis.

i. "Excess opacity reports" that list all opacity measurements which exceed 30 percent, averages over a six minute period. These reports shall also provide, for each such incident, the percent opacity measured as well as the date and span of such incident. These reports shall state the reasons for excess opacity. These reports shall also specify the date of those periods during which the continuous monitoring system was not in operation.

ii. "Summary reports" that provide the average opacity, 6-minute average, measured during the reporting period and the distribution of opacity measurements, 6-minute average and hourly average, during the reporting period, by percent, in ranges as follows:

Ranges	
6-Minute Averages	Hourly Averages
≤ 2	≤ 1
> 2 and ≤ 5	> 1 and ≤ 3
> 5 and ≤ 10	> 3 and ≤ 6
> 10 and ≤ 15	> 6 and ≤ 10
> 15 and ≤ 20	> 10 and ≤ 15
> 20 and ≤ 30	> 15
> 30	

b. 40 CFR Part 63, Subpart CCCCC (40 CFR 63.7336)

Pursuant to 63.7336(a) the Permittee must report each instance in which it did not meet each emission limitation in Conditions 7.2.3-5(c), 7.2.3-6(a) and 7.2.3-7(b). This includes periods of startup, shutdown, and malfunction. The Permittee must also report each instance in which it did not meet each work practice standard or operation and maintenance requirement in Condition 7.2.8-2(h). These instances are deviations from the emission limitations (including operating limits), work practice standards, and operation and maintenance requirements. These deviations must be reported according to the requirements in 40 CFR 63.7341.

c. 40 CFR Part 63, Subpart CCCCC (40 CFR 63.7341)

i. Pursuant to 40 CFR 63.7341(a)(3) and (4), compliance report due dates. Unless the Illinois EPA has approved a different schedule, the Permittee shall submit quarterly compliance reports for battery

stacks and semiannual compliance reports for all other affected sources to the Illinois EPA according to the following requirements:

A. All quarterly compliance reports for battery stacks must be postmarked or delivered no later than one calendar month following the end of the quarterly reporting period. All semiannual compliance reports must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

B. If the Illinois EPA has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A), the Permittee may submit compliance reports according to the dates the Illinois EPA has established instead of according to the dates in 40 CFR 63.7341(a)(1) through (3).

ii. Quarterly compliance report contents. Each quarterly report must provide information on compliance with the emission limitations for battery stacks in 40 CFR 63.7296. The reports must include the information in 40 CFR 63.7341(c)(1) through (3), and as applicable, 40 CFR 63.7341(c)(4) through (8).

iii. Semiannual compliance report contents. Each compliance report must provide information on compliance with the emission limitations, work practice standards, and operation and maintenance requirements for all affected sources except battery stacks. The reports must include the following information [40 CFR 63.7341(c)]:

A. Company name and address.

B. Statement by a responsible official, with the official’s name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

C. Date of report and beginning and ending dates of the reporting period.

D. If the Permittee had a startup, shutdown, or malfunction during the reporting period and the Permittee took actions consistent with the startup, shutdown, and malfunction plan, the compliance report must include the information in 40 CFR 63.10(d)(5)(i).

E. If there were no deviations from the continuous compliance requirements in 40 CFR 63.7333(e) for battery stacks, a statement that there were no deviations from the emission limitations during the reporting period. If there were no deviations from the continuous compliance requirements in 40 CFR 63.7333 through 63.7335 that apply to the Permittee (for all affected sources other than battery stacks), a statement that there were no deviations from the emission limitations, work practice standards, or operation and maintenance requirements during the reporting period.

F. If there were no periods during which a continuous monitoring system (including COMS, continuous emission monitoring system (CEMS), or CPMS) was out-of-control as specified in 40 CFR 63.8(c)(7), a statement that there were no periods during which a continuous monitoring system was out-of-control during the reporting period.

G. For each deviation from an emission limitation in Subpart CCCCC (including quench water limits) and for each deviation from the requirements for work practice standards in Subpart CCCCC that occurs at an affected source where the Permittee is not using a continuous monitoring system (including a COMS, CEMS, or CPMS) to comply with the emission limitations in Subpart CCCCC, the compliance report must contain the following information (this includes periods of startup, shutdown, and malfunction):

1. The total operating time of each affected source during the reporting period.

2. Information on the number, duration, and cause of deviations (including unknown cause, if applicable) as applicable and the corrective action taken.

H. For each deviation from an emission limitation occurring at an affected source where the Permittee is using a continuous monitoring system (including COMS, CEMS, or CPMS) to comply with the emission limitation in Subpart CCCCC, the Permittee shall include the

following information (this includes periods of startup, shutdown, and malfunction):

1. The date and time that each malfunction started and stopped.

2. The date and time that each continuous monitoring system (including COMS, CEMS, or CPMS) was inoperative, except for zero (low-level) and high-level checks.

3. The date, time, and duration that each continuous monitoring system (including COMS, CEMS, or CPMS) was out-of-control, including the information in 40 CFR 63.8(c)(8).

4. The date and time that each deviation started and stopped, and whether each deviation occurred during a period of startup, shutdown, or malfunction or during another period.

5. A summary of the total duration of the deviation during the reporting period and the total duration as a percent of the total source operating time during that reporting period.

6. A breakdown of the total duration of the deviations during the reporting period into those that are due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

7. A summary of the total duration of continuous monitoring system downtime during the reporting period and the total duration of continuous monitoring system downtime as a percent of the total source operating time during the reporting period.

8. An identification of each HAP that was monitored at the affected source.

9. A brief description of the process units.

10. A brief description of the continuous monitoring system.

11. The date of the latest continuous monitoring system certification or audit.

12. A description of any changes in continuous monitoring systems, processes, or controls since the last reporting period.

iv. Immediate startup, shutdown, and malfunction report. If the Permittee had a startup, shutdown, or malfunction during the semiannual reporting period that was not consistent with the Permittee's startup, shutdown, and malfunction plan, the Permittee shall submit an immediate startup, shutdown, and malfunction report according to the requirements in 40 CFR 63.10(d)(5)(ii).

d. 40 CFR Part 63, Subpart L (40 CFR 63.311)

i. Semiannual compliance certification. The Permittee shall include the following information in the semiannual compliance certification [40 CFR 63.311(d)]:

A. Certification, signed by the Permittee, that no coke oven gas was vented, except through the bypass/bleeder stack flare system of a by-product coke oven battery during the reporting period or that a venting report has been submitted according to the requirements in 40 CFR 63.311(e).

B. Certification, signed by the Permittee, that a startup, shutdown, or malfunction event did not occur for a coke oven battery during the reporting period or that a startup, shutdown, and malfunction event did occur and a report was submitted according to the requirements in 40 CFR 63.310(e).

C. Certification, signed by the Permittee, that work practices were implemented if applicable under 40 CFR 63.306.

ii. Report for the venting of coke oven gas other than through a flare system. The Permittee shall report any venting of coke oven gas through a bypass/bleeder stack that was not vented through the bypass/bleeder stack flare system to the Administrator as soon as practicable but no later than 24 hours after the beginning of the event. A written report shall be submitted within 30 days of the event and shall include a description of the event and, if applicable, a copy of the notification for a

hazardous substance release required, pursuant to 40 CFR 63.311(e).

iii. 40 CFR Part 63, Subpart L (40 CFR 63.310)

A. Pursuant to 40 CFR 63.310(d), in order for the provisions of 40 CFR 63.310(i) to apply with respect to the observation (or set of observations) for a particular day, notification of a startup, shutdown, or a malfunction shall be made by the Permittee:

If practicable, to the certified observer if the observer is at the source during the occurrence; or to the enforcement agencies (USEPA and Illinois EPA), in writing, within 24 hours of the occurrence first being documented by personnel, and if the notification to the certified observer was not made, an explanation of why no such notification was made.

B. Pursuant to 40 CFR 63.310(e), within 14 days of the notification made under 40 CFR 63.310 (d), or after a startup or shutdown, the Permittee shall submit a written report to the Illinois EPA that describes the time and circumstances of the startup, shutdown, or malfunction; and describes actions taken that might be considered inconsistent with the startup, shutdown, or malfunction plan.

e. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations by the affected coke oven operations from applicable requirements unless a NESHAP standard specifies a different timeframe as identified in Condition 7.2.11(c) and (d), as follows:

A. Requirements in Condition 7.2.3(d).

B. Requirements in Condition 7.2.3-1.

C. Requirements in Condition 7.2.3-2.

D. Requirements in Condition 7.2.3-3.

E. Requirements in Condition 7.2.3-4.

F. Requirements in Condition 7.2.3-5.

G. Requirements in Condition 7.2.3-6.

H. Requirements in Condition 7.2.3-7.

I. Requirements in Condition 7.2.3-8.

J. Requirements in Condition 7.2.5-1.

K. Requirements in Condition 7.2.5-2.

L. Requirements in Condition 7.2.6.

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

iii. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

iv. All deviation reports described in Condition 7.2.10(e) above shall contain the following:

A. Date, time and duration of the deviation;

B. Description of the deviation;

C. Probable cause of the deviation; and

D. Any corrective actions or preventive measures taken.

f. Quench stations [08060026]

The Permittee shall provide the following notification and reports to the Illinois EPA, Air Compliance Section and Regional Field Office, pursuant to 35 IAC 201.263, concerning continued operation of quenching operations during malfunction or breakdown that does not meet the requirements of 35 IAC 212.443(h)(1):

i. For noncompliance due to malfunction or breakdown that lasts more than 30 minutes (quenching of four ovens):

A. The Permittee shall notify the Illinois EPA’s regional office by telephone as soon as possible during normal working hours, but no later than the next Agency business day.

B. Upon achievement of compliance, the Permittee shall give a written follow-up notice within 15 days to the Illinois EPA, Air Compliance Section and Regional Field Office, providing a detailed explanation of the event, the length of time during which operation continued under such conditions, the measures taken by the Permittee to minimize and correct deficiencies

with chronology, and when the repairs were completed.

C. If compliance is not achieved within 48 hours of the occurrence, the Permittee shall submit interim status reports to the Illinois EPA, Air Compliance Section and Regional Field Office, on a daily basis, until compliance is achieved. These interim reports shall provide a brief explanation of the nature of the malfunction or breakdown, corrective actions accomplished to date, actions anticipated to occur with schedule, and the expected date on which repairs will be complete.

ii. For noncompliance due to malfunction or breakdown that is no more than 30 minutes in duration, the Permittee shall provide the information for the incident or period with the periodic compliance reports required by 40 CFR 63, Subpart CCCCC.

iii. Within two years of initial startup of the low emission quench tower on the West Quench Station, the Permittee shall submit a report evaluating the reduction in filterable and total $PM_{2.5}$ and PM_{10} emissions achieved by this project, on both in terms of emissions per ton of coke quenched and in terms of annual emissions.

g. Reporting on the State malfunction and breakdown authorization shall be performed in accordance with Condition 5.10.5-2.

h. Reporting on the State startup authorization shall be performed in accordance with Condition 5.10.5-1.

i. Reporting on the Federal SSM authorization shall be performed in accordance with Condition 5.10.5-3.

7.2.11 Operational Flexibility/Anticipated Operating Scenarios

Operational flexibility is not set for the affected coke oven operations.

7.2.12 Compliance Procedures

For purposes of 35 IAC 212.443:

a. Coke Oven Charging, Leaks from Doors, Leaks from Lids and Leaks from Off Takes: Observations shall be conducted in accordance with 40 CFR 63, Appendix A, Method 303 which is consistent with the procedures specified in 35 IAC 280.104 to 280.107 and the Consent Decree, Civil Action No. 81-3009 referenced in Construction Permit C808048.

i. Battery A and B – Charging:

Observations shall be conducted in accordance with 40 CFR 63, Appendix A, Method 303 which is consistent with the procedures specified in 35 IAC 280.104 to 280.107 and the Consent Decree, Civil Action No. 81-3009 referenced in Construction Permit C808048.

Observation of charging emissions shall be made from any point or points on the topside of a coke oven battery from which a qualified observer can obtain an unobstructed view of the charging operation.

The qualified observer shall time the visible emissions with a stopwatch while observing the charging operation. Only emissions from the charge port and any part of the larry car shall be timed. The observation shall commence as soon as coal is introduced into the first charge port as indicated by the first charge port as indicated by the first mechanical movement of the coal feeding mechanism on the larry car and shall terminate when the last charge port lid has been replaced. Simultaneous emissions from more than one emission point shall be timed and recorded as one emission and shall not be added individually to the total time.

The qualified observer shall determine and record the total number of seconds that charging emissions are visible during the charging of coal to the coke oven.

For each charge observed, the qualified observer shall record the total number of seconds of visible emissions, the clock time for the initiation and completion of the charging operation and the battery identification and oven number.

The qualified observer shall not record any emissions observed after all charging port lids have been firmly seated following removal of the larry car, such as emissions occurring when a lid has been temporarily removed to permit spilled coal to be swept into the oven.

In the event that observations of emissions from a charge are interrupted due to events beyond the control of the observer, the data from that charge shall be invalidated and the observer shall note on his observation sheet the reason for invalidating the data. The observer shall then resume observation of the next consecutive charge or charges, and continue until he has obtained a set of consecutive charges immediately preceding the interrupted charge and the charge immediately following the interrupted charge shall constitute consecutive charges. Compliance

shall be determined by summing the seconds of charging emission observed during a set of five consecutive charges. Any one charge may be included in only one set of consecutive charges.

ii. Battery A and B – Doors:

Compliance with the percent door area leakage standard shall be determined in accordance with the following method:

Observations of door emissions shall be made from a minimum distance of 25 feet from each door. Each door shall be observed in sequence for only that period necessary to determine whether or not, at the time, there are visible emissions from any point on the door while the observer walks along the side of the battery. If the observer's view of a door is more than momentarily obstructed, as, for example, by door machinery, pushing machinery, coke guide, luter truck, or opaque steam plumes, he shall record the door obstructed and the nature of the obstruction and continue the observations with the next door in sequence which is not obstructed. The observer shall continue this procedure along the entire length of the battery for both sides and shall record the battery identification, battery side, and oven door identification number of each door exhibiting visible emissions. Before completing the traverse or immediately thereafter he shall attempt to reobserve the obstructed doors.

iii. Battery A and B – Charging Ports/Lids:

For purposes of determining compliance with limits on visible emissions from charging ports, observations of any visible emissions shall be made and recorded during the time an observer walks the topside of a battery from one end to the other. Each oven shall be observed in sequence. The observer may also observe off take pipe leaks during this traverse of the battery. The observer shall record the battery identification, the points of emissions from each oven, the oven number, and whether an oven was dampered off. Compliance shall be determined by application of the following formula which shall exclude the ports on up to 3 ovens ahead of the oven being pushed which are dampered off.

iv. Battery A and B – Off Takes:

For purposes of determining compliance with limits on visible emissions from off take pipes, observations of any visible emissions from the off take piping shall be made by traversing the topside of the

battery. During the traverse(s), the observer shall walk as near to the center of the battery as safety considerations permit but may walk as close as necessary to the off take piping to determine whether an observed emission is emanating from the off take piping. Each oven shall be observed in sequence. The observer may also observe charging port emissions during this traverse of the battery. The observer shall record the battery identification, the points of off take piping emission from any oven and the oven number.

b. Coke Oven Pushing:

i. Battery A and B:

Opacity readings shall be taken by a qualified observer located in a position where the oven being pushed, the coke receiving car and the path to the quench tower are visible. The opacity shall be read as the emissions rise and clear the top of the coke battery gas mains. The qualified observer shall record opacity readings of emissions originating at the receiving car and associated equipment and the coke oven, including the standpipe on the coke side of the oven being pushed. Opacity readings shall be taken in accordance with the procedures set forth in 40 CFR Part 60, Appendix A, Method 9, incorporated by reference in 35 IAC 212.113, except that Section 2.5 for data reduction shall not be used. The qualified observer referenced in this subsection shall be certified pursuant to 40 CFR Part 60, Appendix A, Method 9, incorporated by reference in 35 IAC 212.113.

ii. Battery A:

Opacity readings shall be taken at 15-second intervals, beginning from the time the coke falls into the receiving car or is first visible as it emerges from the coke guide whichever occurs earlier, until the receiving car enters the quench tower or quenching device. For a push of less than 90 seconds duration, the actual number of 15-second readings shall be averaged.

At least four consecutive pushes per day.

iii. Battery B:

Opacity readings shall be taken at 15-second intervals, beginning from the time the coke falls into the receiving car or is first visible as it emerges from the coke guide whichever occurs earlier, until the end of the sixth reading. During the

pushing operation, the observer shall observe all the pushing emissions including, but not limited to, fugitive emissions from the pushing emission control device and from open quench cars during travel.

At a minimum, one push per day.

c. Coke Quenching (35 IAC 212.443(h)(2))

i. Samples shall be taken from each quench station as separate grab samples or composite samples.

ii. Samples shall be collected a minimum of five days per week and analyzed to report a weekly concentration. The samples for each week shall be analyzed either:

A. Separately, with the average of the individual daily concentrations determined; or

B. As one composite sample, with equal volumes of the individual daily samples combined to form the composite sample.

7.2.13 State-Only Conditions

State-only conditions are not being established.

7.3 Coke By-Product Recovery Plant and COG Desulfurization System

7.3.1 Description

COG is made up of various organic materials volatilized during the coal-to-coke conversion process. The raw coke oven gas from U. S. Steel two existing coke oven batteries is processed in the coke by-product recovery plant, where various byproducts are removed. Once treated, the COG is used as a fuel in the coke batteries and in various boilers and furnaces throughout the facility.

Coke Oven Gas (COG) Processing Unit:

COG from the coke ovens first passes through the primary cooler where it is cooled. The cooling of COG causes tar, naphthalene, and liquor to condense. The cool COG is then pushed through the entire by-product plant with the aid of exhausters. More tar and liquor are removed by the centrifugal force created in the exhausters. Droplets of tar, naphthalene, and liquor accumulate and drain to the tar sump. Ammonia present in the COG is then removed by passing it through ammonia absorber. The removal of ammonia is accomplished by exposing the COG to a spray of sulfuric acid in the ammonia absorber. The COG then enters the Tar Spray Final Cooler where the COG is further cooled and most of the naphthalene is removed with tar injection. Next COG passes through the Light Oil Scrubber, which is designed to remove the remaining naphthalene and “Light Oils”.

From the light oil scrubber, the treated COG is normally further processed in the COG desulfurization system to remove sulfur. The COG is not always processed by desulfurization system because of the need for periodic maintenance on the system. The permit limits the amount of time during which this may occur. COG desulfurization system consists of a packed tower amine unit, hydrogen cyanide destruction unit, and a Claus sulfur recovery unit with tail gas oxidizer. The system removes hydrogen sulfide (H_2S) from the treated COG stream from the by-product plant. The COG desulfurization system is not part of the by-products recovery plant.

The COG stream from the by-product plant is sent to a pressure holding tank from where the COG is distributed to underfire the Coke Oven Batteries and various parts of the plant.

Light Oil Processing Unit:

Processing the Light Oil generated at the Light Oil Scrubber, also called Benzol Washer, is the main activity of this unit. In the Light Oil Scrubber, wash oil is used to scrub out Light Oil from the Coke Oven Gas. Next wash oil is cleaned and re-circulated back through the Light Oil scrubber as described below.

After scrubbing out the light oil in the Light Oil Scrubber, the wash oil passes through two oil to vapor heat exchangers, where the light oil is vaporized. The vapors are then passed through two cool water condensers to condense out the light oil. The light oil then passes through the Secondary Light Oil Separator, where any remaining wash oil and water is removed. The liquid oil is then pumped into one of six storage tanks.

After passing through the oil to vapor heat exchangers, the wash oil passes through steam heaters, the Wash Oil Still, coolers, and finally the Wash Oil Recirculating Tank before it is reintroduced in the Light Oil Scrubber.

Coal Tar Processing:

Tar is collected into a tar sump. The tar is decanted by passing through one of three decanters. Sludge from the decanters is dumped into hoppers from where it is collected by a company for further treatment. Tar from the decanters pass through two dehydration tanks where the water is removed. The tar is then pumped to a storage tank, where it is stored until shipment.

Note: This narrative description is for informational purposes only and is not enforceable.

7.3.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
By-Product Recovery	Coke oven Gas Processing Unit (coke oven gas transfer and handling; gas coolers; gas processing/cleaning unit)	Prior to 06/1982	Steam Blanketing
By-Product Recovery (Continued)	Light Oil Processing (stills; process condensers; sumps) Coal Tar Processing (tar collection and transfer; tar storage tanks) Tar Storage Tanks; Dehydration Tanks; Decanters; Light Oil Storage Tanks; Ammonia Liquor; Storage Tanks	Prior to 06/1982	Clean Gas Blanketing; Steam Blanketing; Negative Pressure Systems

Emission Unit	Description	Date Constructed	Emission Control Equipment
	Railcar/Truck Loading	2004	Vapor Recovery System; Negative Pressure
COG Desulfurization System	Packed tower amine unit and hydrogen cyanide destruction unit		Closed Systems
	Claus Sulfur Recovery Unit		Thermal Oxidizer
COG Flare	COG holding tank and flare		None

7.3.3 Applicable Provisions and Regulations

a. i. The “affected by-product recovery plant” for the purpose of these unit-specific conditions, is the group of emission units and/operations in the coke by-product recovery plant described in Conditions 7.3.1 and 7.3.2.

ii. The COG desulfurization system is the system for desulfurization of treated COG described in Conditions 7.3.1 and 7.3.2.

iii. The COG flare is the system for burning of excess of COG described in Conditions 7.3.1 and 7.3.2.

b. The affected by-product recovery plant is subject to the work practices in 40 CFR Part 61, Subpart L, National Emission Standards for Benzene Emissions from Coke By-Product Recovery Plants.

c. The affected by-product recovery plant is subject to the work practices in 40 CFR Part 61, Subpart V, National Emission Standards for Equipment Leaks (Fugitive Emissions).

d. The affected by-product recovery plant is subject to the work practices in 40 CFR Part 61, Subpart FF, National Emission Standard for Benzene Waste Operations.

e. No person shall cause or allow the loading of any organic material into any stationary tank having a storage capacity of greater than 946 liters (250 gallons), unless such tank is equipped with a permanent submerged loading pipe or an equivalent device approved by the Illinois EPA according to the provisions of 35 IAC 201, and further processed consistent with 35 IAC 219.108, or unless such tank is a pressure tank as described in 35 IAC 219.121(a) or is

fitted with a recovery system as described in 35 IAC 219.121(b)(2) [35 IAC 219.122(b)].

f. The affected by-product recovery plant, COG desulfurization system and COG flare are subject to 35 IAC 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to the requirements of 35 IAC 212.122, except as allowed by 35 IAC 212.123(b) and 212.124.

g. SO_2 emissions from the affected by-product recovery plant and COG flare shall not exceed 2000 ppm pursuant to 35 IAC 214.301.

7.3.4 Non-Applicability of Regulations of Concern

a. The storage tanks used at the affected by-product recovery plant are not subject to 35 IAC 219.120 because of the exemption for vessels at coke by-product plants in 35 IAC 219.119(b).

b. The storage tanks used at the affected by-product recovery plant are not subject to 35 IAC 219.121 (Storage Containers of Volatile Petroleum Liquids (VPL)) because the liquids kept in those tanks are not the product of petroleum refinery and, therefore, do not meet the definition of VPL/petroleum liquids of 35 IAC Part 211.

c. This permit is issued based on the affected by-product recovery plant not being subject to the applicable requirements of 35 IAC 219.301 because there is 85% reduction of uncontrolled organic material that would otherwise be emitted into atmosphere, pursuant to 35 IAC 219.302.

d. The COG desulfurization system and COG flare are not subject to 40 CFR 63 Subpart L, National Emission Standards for Benzene Emissions from Coke By-Product Recovery Plants, because both COG systems are not involved in the separation and recovery of coal tar derivatives evolved from coal during the coking process of a coke oven battery.

e. This permit is issued based on the COG desulfurization system (thermal oxidizer) not being subject to 35 IAC 214.301 pursuant to 35 IAC 214.302, which provides that 35 IAC 214.301 shall not apply to processes designed to remove sulfur compounds from the flue gases of fuel combustion emission sources.

7.3.5 Operation of COG Flare during Malfunction and Breakdown

Pursuant to 35 IAC 201.149 and Part 201 Subpart I, subject to the following terms and conditions, the Permittee is authorized

to continue to operate the COG flare in excess of the applicable state standard in Condition 7.3.3(f) in the event of a malfunction or breakdown.

Note: This authorization is provided because the Permittee applied for such authorization in its CAAPP application, generally explaining why such continued operation would be required to prevent injury to personnel or severe damage to equipment, and describing the measures that will be taken to minimize emissions from any malfunctions and breakdowns.

a. This authorization only allows such continued operation as necessary to prevent injury to personnel or severe damage to equipment and does not extend to continued operation solely for the economic benefit of the Permittee.

b. Upon occurrence of excess emissions due to malfunction or breakdown, the Permittee shall, as soon as practicable, repair the COG flare, reduce flare load or remove it from service so that excess emissions cease.

c. The Permittee shall fulfill the applicable recordkeeping and reporting requirements of Conditions 7.3.10(h) and 5.10.5-2 For these purposes, time shall be measured from the start of a particular incident. The absence of excess emissions for a short period shall not be considered to end the incident if excess emissions resume.

d. Following notification to the Illinois EPA (see Condition 5.10.5-2(a)(i))of a malfunction or breakdown with excess emissions, the Permittee shall comply with all reasonable directives of the Illinois EPA with respect to such incident.

e. This authorization does not relieve the Permittee from the continuing obligation to minimize excess emissions during malfunction or breakdown. As provided by 35 IAC 201.265, an authorization in a permit for continued operation with excess emissions during malfunction and breakdown does not shield the Permittee from enforcement for any such violation and only constitutes a prima facie defense to such an enforcement action provided that the Permittee has fully complied with all terms and conditions connected with such authorization.

7.3.6 Control Requirements and Work Practices

a. 40 CFR Part 61, Subpart L:

i. The Permittee shall operate and maintain a Control System to meet the standards specified below in 40 CFR Part 61 Subpart L. This Control System consists of a Positive Pressure Gas Blanketing System supplied with clean coke oven gas controlling the light oil

area and a Negative Pressure or Steam Blanketing System controlling tar, ammonia and liquor tanks.

ii. These control systems shall be designed to operate with no detectable emissions (an organic chemical concentration more than 500 ppm above a background concentration), as determined by the methods specified in 40 CFR 61.245, pursuant to 40 CFR 61.132(b).

iii. The Permittee shall comply with 40 CFR 61.132 - Standard: Process vessels, storage tanks, and tar-intercepting sumps, which includes the following:

A. Each owner or operator of a furnace byproduct recovery plant shall enclose and seal all openings on each process vessel, tar storage tank, and tar-intercepting sump.

B. The owner or operator shall duct gases from each process vessel, tar storage tank, and tar-intercepting sump to the gas collection system, gas distribution system, or other enclosed point in the by-product recovery process where the benzene in the gas will be recovered or destroyed. This control positive pressure blanketing system shall be designed and operated for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background and visual inspections, as determined by the methods specified in 40 CFR 61.245(c).

1. Except, the owner or operator may elect to install, operate, and maintain a pressure relief device, vacuum relief device, an access hatch, and a sampling port on each process vessel, tar storage tank, and tar-intercepting sump. Each access hatch and sampling port must be equipped with a gasket and a cover, seal, or lid that must be kept in a closed position at all times, unless in actual use.

2. The owner or operator may elect to leave open to the atmosphere the portion of the liquid surface in each tar decanter necessary to permit operation of a sludge conveyor. If the owner or operator elects to maintain an opening on part of the liquid surface of the tar decanter, the owner or operator shall install, operate, and maintain a water leg seal on the tar decanter roof near the sludge

discharge chute to ensure enclosure of the major portion of liquid surface not necessary for the operation of the sludge conveyor.

C. Each owner or operator of a furnace coke by-product recovery plant also shall comply with the requirements of 40 CFR 61.132(a) through (c) for each benzene storage tank, BTX storage tank, light-oil storage tank, and excess ammonia-liquor storage tank.

iv. The Permittee shall comply with 40 CFR 61.133 - Standard: Light-oil sumps, which includes the following, pursuant to 40 CFR 61.133(a) and 61.133(c):

A. Each owner or operator of a light-oil sump shall enclose and seal the liquid surface in the sump to form a closed system to contain the emissions.

1. Except, the owner or operator may elect to install, operate, and maintain a vent on the light-oil sump cover. Each vent pipe must be equipped with a water leg seal, a pressure relief device, or vacuum relief device.

2. Except, the owner or operator may elect to install, operate, and maintain an access hatch on each light-oil sump cover. Each access hatch must be equipped with a gasket and a cover, seal, or lid that must be kept in a closed position at all times, unless in actual use.

3. The light-oil sump cover may be removed for periodic maintenance but must be replaced (with seal) at completion of the maintenance operation.

B. The venting of steam or other gases from the by-product process to the light-oil sump is not permitted [40 CFR 61.133(a)].

C. Following the installation of any control equipment used to meet the requirements of 40 CFR 61.133(a), the owner or operator shall monitor the connections and seals on each control system to determine if it is operating with no detectable emissions, using Method 21 (40 CFR Part 60, Appendix A) and the procedures specified in 40 CFR 61.245(c), and shall

visually inspect each source (including sealing materials) for evidence of visible defects such as gaps or tears. This monitoring and inspection shall be conducted semiannually and at any other time the cover is removed.

1. If an instrument reading indicates an organic chemical concentration more than 500 ppm above a background concentration, as measured by Method 21, a leak is detected.

2. If visible defects such as gaps in sealing materials are observed during a visual inspection, a leak is detected.

3. When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected.

4. A first attempt at repair of any leak or visible defect shall be made no later than 5 calendar days after each leak is detected [40 CFR 61.133(c)].

v. The Permittee shall comply with 40 CFR 61.135 - Standard: Equipment leaks.

A. Each piece of equipment in benzene service to which 40 CFR 61 Subpart L applies shall be marked in such a manner that it can be distinguished readily from other pieces of equipment in benzene service [40 CFR 61.135(c)].

B. Each owner or operator of equipment in benzene service shall comply with requirements of 40 CFR 61, Subpart V.

C. The provisions of 40 CFR 61.242-3 and 61.242-9 of Subpart V do not apply to Subpart L.

b. 40 CFR Part 61, Subpart V:

40 CFR 61.242-10: Standards: Delay of Repair

i. Delay of repair of equipment for which leaks have been detected will be allowed if repair within 15 days is technically infeasible without a process unit shutdown. Repair of this equipment shall occur before the end of the next process unit shutdown.

ii. Delay of repair of equipment for which leaks have been detected will be allowed for equipment that is

isolated from the process and that does not remain in VHAP (volatile hazardous air pollutant) service.

iii. Delay of repair for valves will be allowed if:

A. The owner or operator demonstrates that emissions of purged material resulting from immediate repair are greater than the fugitive emissions likely to result from delay of repair; and

B. When repair procedures are affected, the purged material is collected and destroyed or recovered in a control device complying with 40 CFR 61.242-11.

iv. Delay of repair for pumps will be allowed if:

A. Repair requires the use of a dual mechanical seal system that includes a barrier fluid system; and

B. Repair is completed as soon as practicable, but not later than 6 months after the leak was detected.

v. Delay of repair beyond a process unit shutdown will be allowed for a valve if valve assembly replacement is necessary during the process unit shutdown, valve assembly supplies have been depleted, and valve assembly supplies had been sufficiently stocked before the supplies were depleted. Delay of repair beyond the next process unit shutdown will not be allowed unless the next process unit shutdown occurs sooner than 6 months after the first process unit shutdown.

c. 40 CFR 61 Subpart FF (61.355(a)(3) through (a)(5)).

i. Pursuant to 40 CFR 61.355(a)(3), if the total annual benzene quantity from facility waste is equal to or greater than 10 Mg/yr (11 tons/yr), then the owner or operator shall comply with the requirements of 40 CFR 61.342(c), (d), or (e).

ii. Pursuant to 40 CFR 61.355(a)(4), if the total annual benzene quantity from facility waste is less than 10 Mg/yr (11 tons/yr) but is equal to or greater than 1 Mg/yr, (1.1 ton/yr), then the owner or operator shall:

A. Comply with the recordkeeping requirements of 40 CFR 61.356 and reporting requirements of 40 CFR 61.357; and

B. Repeat the determination of total annual benzene quantity from facility waste at least once per year and whenever there is a change in the process generating the waste that could cause the total annual benzene quantity from facility waste to increase to 10 Mg/yr (11 ton/yr) or more.

iii. Pursuant to 40 CFR 61.355(a)(5), if the total annual benzene quantity from facility waste is less than 1 Mg/yr (1.1 ton/yr), then the owner or operator shall:

A. Comply with the recordkeeping requirements of 40 CFR 61.356 and reporting requirements of 40 CFR 61.357; and

B. Repeat the determination of total annual benzene quantity from facility waste whenever there is a change in the process generating the waste that could cause the total annual benzene quantity from facility waste to increase to 1 Mg/yr (1.1 ton/yr) or more.

d. The COG flare shall be operated with a flame present at all times when COG is vented to the flare [Section 39.5(7)(a) of the Act].

7.3.7 Production and Emission Limits for the COG Desulfurization System from Permit 06070022

a. The Permittee shall operate COG desulfurization system (COG-DS) at all times the by-products plant is producing COG, except when undertaking maintenance or repairs of the system. This total “outage” period shall not exceed 35 days (840 hours) per calendar year.

b. i. Raw COG production during periods of time when the COG-DS is not operating shall not exceed 1,092 mmscf/year.

ii. Total amount of COG generated by Coke Oven Batteries A and B and processed by by-products plant shall not exceed 1,140 mmscf/month and 11,400 mmscf/year.

c. i. The COG-DS shall be operated and maintained in conformance with good air pollution control practices.

ii. The thermal oxidizer combustion chamber for the sulfur recovery unit shall be operated at a temperature that is greater than 1,100°F.

d. i. The H_2S content of the raw COG entering the COG-DS shall not exceed 500 grains of H_2S/100 scf of COG, daily average.

ii. The H_2S content of desulfurized COG exiting the COG-DS shall not exceed 66 grains/100 scf of COG, annual average.

iii. During periods of time when the COG-DS is operating, the H_2S content of COG shall not exceed the following limits: 25 grains of H_2S/100 scf of COG, monthly average, excluding outages, startup, shutdown, and upsets such as failure of fans, pumps or heat exchangers and aberrations in the composition or condition of the raw COG.

e. i. Emissions from the thermal oxidizer on the COG-DS shall not exceed the following limits:

PM_{10}		SO_2	
(Lbs/Hr)	(Tons/Yr)	(Lbs/Hr)	(Tons/Yr)
5.6	24.6	67.3	294.7

ii. Combined emissions of PM_{10} and SO_2 from the thermal oxidizer on COG-DS and combustion of coke oven gas shall not exceed 246.8 and 1,074.1 tons/year for PM_{10} and SO_2, respectively [T1].

iii. Compliance with the annual limits in Conditions 7.3.7(b) and (e) shall be determined from a running total of 12 months of data, unless otherwise specified [T1].

7.3.8 Testing Requirements

a. The Permittee, as the owner or operator of a by-products plant, subject to the provisions of 40 CFR Part 61 Subpart L, shall comply with the requirements in 40 CFR 61.245.

b. The Permittee shall determine the total annual benzene (TAB) quantity of the facility using the test methods and procedures for determination in 40 CFR 61.355(a)(5). In particular, if the total annual benzene quantity from facility waste is less than 1 Mg/yr (1.1 ton/yr), then the owner or operator shall repeat the determination of total annual benzene quantity from facility waste whenever there is a change in the process generating the waste that could cause the total annual benzene quantity from facility waste to increase to 1 Mg/yr (1.1 ton/yr) or more.

c. For the COG flare and the thermal oxidizer in the COG-DS, the Permittee shall conduct observations for visible emissions and/or opacity, using USEPA Method 22 and 9, respectively. These observations shall be conducted by individual(s) certified to observe opacity by USEPA Method 9. The observer(s) may either conduct observations for opacity or conduct observations for visible emissions, immediately followed by observations for opacity if visible

emissions are observed. Observations shall be conducted in at least a monthly basis for the COG flare and an annual basis for the COG-DS thermal oxidizer. In addition, for the COG flare, observations shall be coordinated with weather conditions so that at least two observations are made in each calendar year during elevated wind speed conditions, i.e., wind speed of at least 16 miles per hour.

d. Upon the written request from the Illinois EPA, the emission tests shall be conducted by the Permittee for the COG-DS to verify compliance with emission limits in Condition 7.3.7(e) as follows [Section 39.5(7)(d) and (p) of the Act]:

i. The following USEPA test methods shall be used, unless another USEPA method is approved by the Illinois EPA.

Location of Sample Points	Method 1
Gas Flow and Velocity	Method 2
Flue Gas Weight	Method 3
Moisture	Method 4
PM_{10}	Method 201 or 201A
SO_2	Method 6

ii. Observations of opacity shall be conducted during these emission tests in accordance with Method 9 and the results of these observations included in the reports for emission testing.

iii. For this emission testing, test notifications and reporting shall be done by the Permittee in accordance with Conditions 8.6.2 and 8.6.3 of this permit.

7.3.9 Monitoring Requirements

a. For the coke by-product recovery plant, when equipment operated in benzene service is tested for compliance with or monitored for no detectable emissions, the owner or operator shall comply with the following requirements [40 CFR 61.245(c)]:

i. The requirements of 40 CFR 61.245 (b) (1) through (4) shall apply.

ii. The background level shall be determined, as set forth in Method 21.

iii. The instrument probe shall be traversed around all potential leak interfaces as close to the interface as possible as described in Method 21.

iv. The arithmetic difference between the maximum concentration indicated by the instrument and the background level is compared with 500 ppm for determining compliance.

b. Alternatives procedures are not established for each exhauster, as provided by 40 CFR 61.135(e) through (g) and 40 CFR 61.136(d). Therefore, pursuant to 40 CFR 61.135(d), each exhauster shall be monitored quarterly to detect leaks 10,000 ppm or greater by the methods specified in 40 CFR 61.245(b).

c. For the coke by-product recovery plant, the owner or operator shall monitor the connections and seals on each control system to determine if it is operating with no detectable emissions, using Method 21 (40 CFR Part 60, Appendix A) and procedures specified in 40 CFR 61.245(c), and shall visually inspect each source (including sealing materials) and the ductwork of the control system for evidence of visible defects such as gaps or tears. This monitoring and inspection shall be conducted on a semiannual basis and at any other time after the control system is repressurized with blanketing gas following removal of the cover or opening of the access hatch.

i. If an instrument reading indicates an organic chemical concentration more than 500 ppm above a background concentration, as measured by Method 21, a leak is detected.

ii. If visible defects such as gaps in sealing materials are observed during a visual inspection, a leak is detected.

iii. When a leak is detected, it shall be repaired by the Permittee as soon as practicable, but not later than 15 calendar days after it is detected.

iv. A first attempt at repair of any leak or visible defect shall be made by the Permittee no later than 5 calendar days after each leak is detected.

d. Pursuant to 40 CFR Part 61.132(a), the Permittee shall operate and maintain Control Systems on the coke by-product plant in accordance with the work practices in 40 CFR Part 61 Subpart L, as specified below. This Control System consists of a Positive Pressure Gas Blanketing System supplied with clean coke oven gas controlling the light oil area and a Negative Pressure or Steam Blanketing System controlling tar, ammonia and liquor tanks.

i. The following procedures shall be conducted on the control system on a semiannual basis and after each time the control system is repressurized and the Permittee shall [40 CFR 61.132(b)]:

A. Inspect the ductwork for evidence of visible defects such as gaps or tears.

B. Monitor the connections and seals to determine if operating with no detectable emissions.

ii. A maintenance inspection of the control system shall be conducted on an annual basis for evidence of system abnormalities such as blocked or plugged lines, sticking valves, plugged condensate traps and other maintenance defects that could result in abnormal system operation. The owner or operator shall make a first attempt at repair within 5 days, with repair within 15 days of detection [40 CFR 61.132(c)].

e. COG flare

Pursuant to Sections 39.5(7)(a) and (d) of the Act, for the COG flare:

i. The Permittee shall either:

A. Install, operate and maintain instrumentation, with alarm, to confirm the presence of a flame at the flare tip; or

B. Monitor for the presence of a pilot flame using a thermocouple or other equivalent device to detect the presence of a flame; or

C. Verify, once per shift, the presence of a flame at the tip of the flare, and that the flare gas header has a positive pressure.

ii. The Permittee shall perform the following inspections of the flare:

A. An inspection of the ignition system on an annual basis;

B. A detailed maintenance and repair inspection during the period when the flare is out of service and/or idled.

f. Monitoring requirements for COG established by FESOP 94120017, Permit 06070022 and Section 39.5(7)(a) of the Act:

i. The Permittee shall operate systems for monitoring the hydrogen sulfide (H_2S) content of the COG exiting the affected by-product plant and exiting the COG-DS.

The H_2S concentration shall be measured on a wet gas basis.

ii. These H_2S monitoring systems shall be equipped with a strip chart recorder or disk storage and shall be capable of recording the H_2S content in grains per standard cubic feet.

iii. These H_2S monitoring systems shall meet the applicable requirements of Performance Specification 7 of 40 CFR 60, Appendix B. These H_2S monitoring systems shall be operated, and data collected, reduced and maintained, in accordance with the applicable requirements of 40 CFR 60.13 and 35 IAC Part 201 Subpart L.

iv. The H_2S monitoring system for COG exiting the by-product plant shall comply with the following requirements for collection of data:

A. The system shall collect hourly average H_2S content data for at least 75% of the daily operating hours in which COG is not treated by the COG-DS (e.g., at 24 hours/day COG production, at least 18 hourly averages of H_2S content must be obtained). In the event that this minimum data requirement cannot be met by the H_2S monitoring system, the H_2S content data shall be supplemented or obtained by one of the following alternative methods.

I. H_2S determined by type of coal used during that period and previous recorded H_2S content when using this coal type. This method shall only be used for a maximum of 15 days per calendar year.

II. A manual sample of COG shall be taken daily and the H_2S content shall be determined by 40 CFR 60, Appendix A, Method 11, as adapted to measure higher ranges of H_2S. This value, or a value based on the mean of the daily values plus two standard deviations for the previous 90 days for which a reading was obtained, whichever is higher, shall be used. Should a coal blend change occur during the period this alternative method is being used, the mean value plus two standard deviations will be adjusted to reflect any potential change in the H_2S content from that of the previous coal blend.

B. The system shall collect H_2S content data for at least 75% of the daily operating hours in which COG is treated by the COG-DS with this data being the average over at least 5 minutes in each such operating hour. In the event that this minimum data requirement cannot be met by the H_2S monitoring system or can only be met with manual cycling of the H_2S monitoring system for treated COG data shall be supplemented or obtained by one of the following alternative methods:

I. H_2S data as obtained by manual sampling and analysis at least one per day; or

II. H_2S data as obtained from the H_2S monitoring system for treated COG at least twice per day, at least 8 hours apart.

C. The alternative methods provided for in this condition shall only be used in the event of a malfunction or breakdown of the H_2S monitoring systems, i.e., not during periods when a monitoring system is functioning properly to collect valid data.

v. These H_2S monitors shall be tested at least every 12 months in accordance with 40 CFR 60, Appendix B, Performance Specification 7. The results of these tests shall be sent to the IEPA’s Division of Air Pollution, Control Permit Section and Regional Office within 14 days after summarizing of results. In addition, the results shall be maintained in accordance with the recordkeeping specified in this permit. For the H_2S monitoring system for COG exiting the by-product plant, this testing shall be conducted as follows:

A. The H_2S content in grains per standard cubic foot of COG shall be determined using 40 CFR 60, Appendix A, Method 11 as adapted to measure higher ranges of H_2S.

B. The following revisions shall be made to Method 11 to allow the measuring of higher ranges of H_2S:

1. Diluent air shall mean air containing less than 0.5 ppm total sulfur compounds and less than 10 ppm each of moisture and hydrocarbons.

2. 7.0 Procedure - Located after the sampling valve, there will be a gas mixing box with a metered supply of (heated) diluent air. This metered supply of diluent air will be introduced prior to sampling and adjusted so that the final dilution of the sample will be 1:20 (i.e., 0.05 liters/min of sample to 0.95 liters/min of dilution air).

3. 9.4 - Vm = Volume of gas sample through the gas meter (meter conditions), liters/20.

Vm_{CSTD} = (Corrected) volume at standard conditions of gas sampled through the dry gas meter. (Standard Liters).

vi. In the event of malfunction or breakdown of the H2S monitoring systems, the Permittee shall repair and recalibrate the meter or monitoring systems as soon as practicable but no later than 10 days after the malfunction or breakdown is detected, unless prior Illinois EPA approval is obtained by submitting adequate justification to the Illinois EPA detailing the reasons for delay. Records of repair and recalibration must be maintained in accordance with the recordkeeping requirements of this permit. This condition does not relieve the Permittee of the minimum data collection requirements of this permit.

g. The Permittee shall equip the thermal oxidizer in the COG-DS with a continuous monitoring system, which shall be calibrated, maintained, and operated at all times the COG-DS thermal oxidizer is in operation, to monitor the combustion chamber temperature of the thermal oxidizer [Sections 39.5(7)(a) and (d) of the Act].

h. The Permittee shall sample and analyze the COG exiting the byproduct plant and treated COG from the COG-DS for PM content using appropriate ASTM methods or other comparable methodology. These measurements shall be conducted at least annually. The records for this activity shall also include data for the H_2S content of COG at the time of sampling [Sections 39.5.7(a) and (d) of the Act].

7.3.10 Recordkeeping Requirements

The Permittee shall maintain records of the following items for the affected by-product recovery plant, the COG-DS and COG flare, pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. 40 CFR Part 61 Subpart L (40 CFR 61.138):

i. The following information pertaining to the design of control equipment installed to comply with 40 CFR 61.132 through 61.134 shall be recorded and kept in a readily accessible location:

A. Detailed schematics, design specifications, and piping and instrumentation diagrams.

B. The dates and descriptions of any changes in the design specifications.

ii. The following information pertaining to sources subject to 40 CFR 61.132 and sources subject to 40 CFR 61.133 shall be recorded and maintained for 2 years following each semiannual (and other) inspection and each annual maintenance inspection:

A. The date of the inspection and the name of the inspector.

B. A brief description of each visible defect in the source or control equipment and the method and date of repair of the defect.

C. The presence of a leak, as measured using the method described in 40 CFR 61.245(c). The record shall include the date of attempted and actual repair and method of repair of the leak.

D. A brief description of any system abnormalities found during the annual maintenance inspection, the repairs made, the date of attempted repair, and the date of actual repair.

b. 40 CFR Part 61 Subpart FF (40 CFR 61.356):

i. Each owner or operator of a facility subject to the provisions of Subpart FF shall comply with the recordkeeping requirements of 40 CFR 61.356. Each record shall be maintained in a readily accessible location at the facility site for a period not less than two years from the date the information is recorded unless otherwise specified [40 CFR 61.356(a)].

ii. Each owner or operator shall maintain records that identify each waste stream at the facility subject to Subpart FF, and indicate whether or not the waste stream is controlled for benzene emissions in accordance with this subpart. In addition the owner or operator shall maintain the following records [40 CFR 61.356(b)]:

A. For each waste stream not controlled for benzene emissions in accordance with Subpart FF, the records shall include all test results, measurements, calculations, and other documentation used to determine the following information for the waste stream: waste stream identification, water content, whether or not the waste stream is a process wastewater stream, annual waste quantity, range of benzene concentrations, annual average flow-weighted benzene concentration, and annual benzene quantity.

B. For each waste stream exempt from 40 CFR 61.342(c)(1) in accordance with 40 CFR 61.342(c)(3), the records shall include:

1. All measurements, calculations, and other documentation used to determine that the continuous flow of process wastewater is less than 0.02 liters (0.005 gallons) per minute or the annual waste quantity of process wastewater is less than 10 Mg/yr (11 ton/yr) in accordance with 40 CFR 61.342(c)(3)(i), or

2. All measurements, calculations, and other documentation used to determine that the sum of the total annual benzene quantity in all exempt waste streams does not exceed 2.0 Mg/yr (2.2 ton/yr) in accordance with 40 CFR 61.342(c)(3)(ii).

C. For each facility where process wastewater streams are controlled for benzene emissions in accordance with 40 CFR 61.342(d), the records shall include for each treated process wastewater stream all measurements, calculations, and other documentation used to determine the annual benzene quantity in the process wastewater stream exiting the treatment process.

D. For each facility where waste streams are controlled for benzene emissions in accordance with 40 CFR 61.342(e), the records shall include for each waste stream all measurements, including the locations of the measurements, calculations, and other documentation used to determine that the total benzene quantity does not exceed 6.0 Mg/yr (6.6 ton/yr).

E. For each facility where the annual waste quantity for process unit turnaround waste is determined in accordance with 40 CFR

61.355(b)(5), the records shall include all test results, measurements, calculations, and other documentation used to determine the following information: identification of each process unit at the facility that undergoes turnarounds, the date of the most recent turnaround for each process unit, identification of each process unit turnaround waste, the water content of each process unit turnaround waste, the annual waste quantity determined in accordance with 40 CFR 61.355(b)(5), the range of benzene concentrations in the waste, the annual average flow-weighted benzene concentration of the waste, and the annual benzene quantity calculated in accordance with 40 CFR 61.355(a)(1)(iii).

F. For each facility where wastewater streams are controlled for benzene emissions in accordance with 40 CFR 61.348(b)(2), the records shall include all measurements, calculations, and other documentation used to determine the annual benzene content of the waste streams and the total annual benzene quantity contained in all waste streams managed or treated in exempt waste management units.

iii. An owner or operator shall maintain a record for each visual inspection required by 40 CFR 61.343 through 61.347 that identifies a problem (such as a broken seal, gap or other problem) which could result in benzene emissions. The record shall include the date of the inspection, waste management unit and control equipment location where the problem is identified, a description of the problem, a description of the corrective action taken, and the date the corrective action was completed [40 CFR 61.356(g)].

c. 40 CFR Part 61 Subpart V (40 CFR 61.246):

i. A. Each owner or operator subject to the provisions of Subpart V shall comply with the recordkeeping requirements of 40 CFR 61.246 [40 CFR 61.246(a)(1)].

B. An owner or operator of more than one process unit subject to the provisions of Subpart V may comply with the recordkeeping requirements for these process units in one recordkeeping system if the system identifies each record by each process unit [40 CFR 61.246(a)(2)].

ii. When each leak is detected as specified in 40 CFR 61.242-2, 61.242-3, 61.242-7, 61.242-8, and 61.135,

the following requirements apply to the Permittee [40 CFR 61.246(b)]:

A. A weatherproof and readily visible identification, marked with the equipment identification number, shall be attached to the leaking equipment.

B. The identification on a valve may be removed after it has been monitored for 2 successive months as specified in 40 CFR 61.242-7(c) and no leak has been detected during those 2 months.

C. The identification on equipment, except on a valve, may be removed after it has been repaired.

iii. When each leak is detected as specified in 40 CFR 61.242-2, 61.242-3, 61.242-7, 61.242-8, and 61.135, the following information shall be recorded by the Permittee in a log and shall be kept for 2 years in a readily accessible location [40 CFR 61.246(c)]:

A. The instrument and operator identification numbers and the equipment identification number.

B. The date the leak was detected and the dates of each attempt to repair the leak.

C. Repair methods applied in each attempt to repair the leak.

D. Above 10,000 if the maximum instrument reading measured by the methods specified in 40 CFR 61.245(a) after each repair attempt is equal to or greater than 10,000 ppm.

E. Repair delayed and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

F. The signature of the owner or operator (or designate) whose decision it was that repair could not be effected without a process shutdown.

G. The expected date of successful repair of the leak if a leak is not repaired within 15 calendar days.

H. Dates of process unit shutdowns that occur while the equipment is unrepaired.

I. The date of successful repair of the leak.

iv. The following information pertaining to all equipment to which a standard applies shall be recorded in a log that is kept in a readily accessible location by the Permittee [40 CFR 61.246(e)]:

A. A list of identification numbers for equipment (except welded fittings) subject to the requirements of Subpart V.

B. 1. A list of identification numbers for equipment that the owner or operator elects to designate for no detectable emissions as indicated by an instrument reading of less than 500 ppm above background.

2. The designation of this equipment for no detectable emissions shall be signed by the owner or operator.

C. A list of equipment identification numbers for pressure relief devices required to comply with 40 CFR 61.242-4(a).

D. 1. The dates of each compliance test required in 40 CFR 61.242-2(e), 61.242-3(i), 61.242-4, 61.242-7(f), and 61.135(g).

2. The background level measured during each compliance test.

3. The maximum instrument reading measured at the equipment during each compliance test.

E. A list of identification numbers for equipment in vacuum service.

v. The following information pertaining to all valves subject to the requirements of 40 CFR 61.242-7(g) and (h) and to all pumps subject to the requirements of 40 CFR 61.242-2(g) shall be recorded by the Permittee in a log that is kept in a readily accessible location [40 CFR 61.246(f)]:

A. A list of identification numbers for valves and pumps that are designated as unsafe to monitor, an explanation for each valve or pump stating why the valve or pump is unsafe to monitor, and the plan for monitoring each valve or pump.

B. A list of identification numbers for valves that are designated as difficult to monitor, an explanation for each valve stating why the valve is difficult to monitor, and the planned schedule for monitoring each valve.

vi. The following information shall be recorded by the Permittee for valves complying with 40 CFR 61.243-2 [40 CFR 61.246(g)]:

A. A schedule of monitoring.

B. The percent of valves found leaking during each monitoring period.

vii. The following information shall be recorded in a log by the Permittee that is kept in a readily accessible location [40 CFR 61.246(h)]:

A. Design criterion required in 40 CFR 61.242-2(d)(5), 61.242-3(e)(2), and 61.135(e)(4) and an explanation of the design criterion; and

B. Any changes to this criterion and the reasons for the changes.

viii. The following information shall be recorded in a log by the Permittee that is kept in a readily accessible location for use in determining exemptions as provided in the applicability section of this subpart and other specific Subparts [40 CFR 61.246(i)]:

A. An analysis demonstrating the design capacity of the process unit, and

B. An analysis demonstrating that equipment is not in VHAP service.

ix. Information and data used to demonstrate that a piece of equipment is not in VHAP service shall be recorded in a log by the Permittee that is kept in a readily accessible location [40 CFR 61.246(j)].

d. The Permittee shall keep the following records for the COG flare [Section 39.5(7)(e) of the Act]:

i. Records of inspections and maintenance or repair activities conducted pursuant to Condition 7.3.9(e)(ii).

ii. H_2S content in the COG with supporting calculations of SO_2 emissions from the flare.

e. The following records for the COG-DS pursuant to Permit 06070022:

i. Temperature monitoring system for thermal oxidizer on the Claus Sulfur Recovery Unit:

A. Recorded data.

B. A log of operating time for the control system or devices, monitoring system, and the coke oven byproducts plant.

C. A maintenance log for the oxidizer and monitoring device detailing all routine and non-routine maintenance performed including dates and duration of any outages.

ii. Operating Records for the Packed Tower Amine Unit:

A. Amine temperature leaving the unit (°F).

B. Amine flow (gallons/minute).

C. COG flow into or out of the unit.

iii. Logs:

A. Operating logs.

B. Maintenance logs detailing all routine and non-routine maintenance performed including dates and duration of any outages.

iv. Production Records:

A. COG production during periods of time when the COG-DS is operating (mmscf/month and mmscf/year).

B. COG production during periods of time when the COG-DS is not operating (mmscf/month and mmscf/year).

v. Records of H_2S content in COG, with supporting data and calculations:

A. H_2S content of COG exiting the by-product plant, daily average.

B. H_2S content of COG, annual average.

C. H_2S content of treated COG, excluding outages, startup, shutdown, and upsets, monthly average.

vi. Emission Records for the COG Desulfurization System (Claus Sulfur Recovery Unit) [Sections 39.5.7(a) and (d) of the Act]

A. A file containing the emission factors used by the Permittee to determine emissions of PM_{10} and SO_2 from the Claus Sulfur Recovery Unit, with supporting documentation. These records shall be reviewed and updated by the Permittee as necessary to assure that the emission factors that it uses to determine emissions of this unit do not understate actual emissions. These records shall be prepared and copies sent to the Illinois EPA in accordance with Condition 5.9.6(c).

B. Engineering calculations for typical and maximum hourly PM_{10} and SO_2 emissions (lbs/hour) Claus Sulfur Recovery Unit, with supporting documentation.

C. Records for the concentration of SO_2 and H_2S (percent by volume) in the tail gas of the Claus Sulfur Recovery Unit, which is sent to the thermal oxidizer, as measured by process instrumentation.

D. Records for any periods of operation of the Claus Sulfur Recovery Unit that are not otherwise addressed in the required records during which the established emission factor in Condition 7.3.10(e)(vi)(A) would understate actual emissions of this unit, with description of the period of operation and an estimate of the additional emissions during such period that would not be accounted for by the established factor, with supporting explanation and calculations.

D. Records for any periods of operation of the Claus Sulfur Recovery Unit that are not otherwise addressed in the required records during which the established emission rate in Condition 7.3.10(e)(vi)(B) would understate the actual emissions of this unit, with description of the period of operation, including date, time and duration, explanation, and an estimate of the additional emissions during such period that would not be accounted for by the established rate, with supporting explanation and calculations.

F. Records for the annual PM_{10} and SO_2 emissions of the Claus Sulfur Recovery Unit for comparison to the limits in Conditions 7.3.7(e), with supporting calculations.

Note: Records for PM_{10} and SO_2 emissions associated with combustion of COG at the facility are contained in Condition 5.9.1(e).

f. The following records for the H_2S monitoring system for COG exiting the by-product plant, pursuant to FESOP 94120017:

i. The hourly average, 3-hour average and daily average H_2S content of the COG in grains per standard cubic foot.

ii. The H_2S monitor strip chart or disk storage.

iii. Thousand standard cubic feet of COG used per 3-hours for slab reheat furnaces 1-3 and ladle drying preheaters and per day for each unit operating group.

iv. The calibration, maintenance and repair of the H_2S monitor used in compliance calculations.

g. Other Records

i. Records of the amount of raw coke oven gas being received from the coke ovens (scf/mo and acf/yr).

ii. Records of the following by-products being produced:

A. Clean coke oven gas (scf/mo and scf/yr);

B. Light oil (gal/mo and gal/yr); and

C. Tar (ton/mo and ton/yr).

iii. If the Permittee operates under manufacturer’s specifications or manufacturer’s instructions, such manufacturer’s documentation shall be kept at the source as part of the required records.

iv. Records of annual benzene waste generated on site (tons/yr).

v. Annual emissions of VOM from the affected by-product recovery plant.

h. Records for Malfunctions or Breakdowns

Pursuant to 35 IAC 201.263, the Permittee shall maintain records of continued operation of the affected COG flare as addressed by Condition 7.3.5 during malfunctions or breakdowns, which at a minimum, shall include the following records. The preparation of these records shall be completed within 45 days of an incident, unless the Permittee conducts a root cause analysis for the incident, in which case the preparation of these records, other than

the root cause analysis, shall be completed within 120 days of the incident.

i. Date, time and duration of the incident.

ii. A detailed description of the incident, including:

A. A chronology of significant events during and leading up to the incident.

B. Relevant operating data for the unit, including information such as operator log entries and directives provided by management during the incident.

C. The measures taken to reduce the quantity of emissions and the duration of the incident including the resources utilized to address the incident.

D. The magnitude of emissions during the incident.

iii. An explanation why continued operation of an affected COG flare was necessary to prevent personnel injury or prevent equipment damage.

iv. A discussion of the cause(s) or probable cause(s) of the incident including the following:

A. Whether the incident was sudden, unavoidable, or preventable, including:

1. Why the equipment design did not prevent the incident;

2. Why better maintenance could not have avoided the incident;

3. Why better operating practices could not have avoided the incident; and

4. Why there was no advance indication for the incident.

B. Whether the incident stemmed from any activity or event that could have been foreseen, avoided or planned for.

C. Whether the incident was or is part of a recurring pattern indicative of inadequate design, operation or maintenance.

v. A description of any steps taken or to be taken to prevent similar future incidents or reduce their frequency and severity.

vi. As an alternative to keeping the records required by Condition 7.3.10(h)(iv), the Permittee may perform a root cause analysis. For this purpose, a root cause analysis is an analysis whose purpose is to determine, correct and eliminate the primary causes of the incident and the excess emissions resulting there from. If the Permittee performs a root cause analysis method that would define the problem, define all causal relationships, provide a causal path to the root cause, delineate the evidence, and provide solutions to prevent a recurrence. Such an analysis shall be completed within one year of the incident.

7.3.11 Reporting Requirements

The Permittee shall submit the following reports pursuant to Section 39.5(7)(a) and (c) of the Act:

a. 40 CFR 61 Subpart L (40 CFR 61.138):

i. A report shall be submitted to the Illinois EPA semiannually starting 6 months after the initial reports required in 40 CFR 61.138(e) and 40 CFR 61.10, which includes the following information [40 CFR 61.138(f)]:

A. For sources subject to 40 CFR 61.132 and sources subject to 40 CFR 61.133:

1. A brief description of any visible defect in the source or ductwork;

2. The number of leaks detected and repaired; and

3. A brief description of any system abnormalities found during each annual maintenance inspection that occurred in the reporting period and the repairs made.

B. For equipment in benzene service subject to 40 CFR 61.135(a), information required by 40 CFR 61.247(b).

C. For each exhauster subject to 40 CFR 61.135 for each quarter during the semiannual reporting period:

1. The number of exhausters for which leaks were detected as described in 40 CFR 61.135(d) and (e)(5);

2. The number of exhausters for which leaks were repaired as required in 40 CFR 61.135(d) and (e)(6); and

3. The results of performance tests to determine compliance with 40 CFR 61.135(g) conducted within the semiannual reporting period.

D. A statement signed by the owner or operator stating whether all provisions of 40 CFR part 61, subpart L, have been fulfilled during the semiannual reporting period.

b. 40 CFR 61 Subpart V (40 CFR 61.247):

i. An owner or operator of any piece of equipment to which Subpart V applies shall submit a statement in writing notifying the Illinois EPA that the requirements of 40 CFR 61.242, 61.245, 61.246, and 61.247 are being implemented [40 CFR 61.247(a)(1)].

ii. A report shall be submitted to the Illinois EPA semiannually starting 6 months after the initial report required in 40 CFR 61.247(a), that includes the following information [40 CFR 61.247(b)]:

A. Process unit identification.

B. For each month during the semiannual reporting period:

1. Number of valves for which leaks were detected as described in 40 CFR 61.242-7(b) of 61.243-2.

2. Number of valves for which leaks were not repaired as required in 40 CFR 61.242-7(d).

3. Number of pumps for which leaks were detected as described in 40 CFR 61.242-2(b) and (d)(6).

4. Number of pumps for which leaks were not repaired as required in 40 CFR 61.242-2(c) and (d)(6).

5. Number of compressors for which leaks were detected as described in 40 CFR 61.242-3(f).

6. Number of compressors for which leaks were not repaired as required in 40 CFR 61.242-3(g).

7. The facts that explain any delay of repairs and, where appropriate, why a process unit shutdown was technically infeasible.

C. Dates of process unit shutdowns which occurred within the semiannual reporting period.

D. Revisions to items reported according to 40 CFR 61.247(a) if changes have occurred since the initial report or subsequent revisions to the initial report.

E. The results of all performance tests and monitoring to determine compliance with no detectable emissions and with 40 CFR 61.243-1 and 61.243-2 conducted within the semiannual reporting period.

c. 40 CFR 61 Subpart FF (40 CFR 61.357)

i. If the total annual benzene quantity from facility waste is less than 1 Mg/yr (1.1 ton/yr), then the owner or operator shall submit to the Illinois EPA and the Administrator a report that updates the information listed in 40 CFR 61.357(a)(1) through (a)(3) whenever there is a change in the process generating the waste stream that could cause the total annual benzene quantity from facility waste to increase to 1 Mg/yr (1.1 ton/yr) or more [40 CFR 61.357(b)].

ii. If the total annual benzene quantity from facility waste is less than 10 Mg/yr (11 ton/yr) but is equal to or greater than 1 Mg/yr (1.1 ton/yr) then the owner or operator shall submit to the Illinois EPA and the Administrator a report that updates the information listed in 40 CFR 61.357 (a)(1) through (a)(3). The report shall be submitted annually and whenever there is a change in the process generating the waste stream that could cause the total annual benzene quantity from facility waste to increase to 10 Mg/yr (11 ton/yr) or more. If the information in the annual report required by 40 CFR 61.357 (a)(1) through (a)(3) is not changed in the following year, the owner or operator may submit a statement to that effect [40 CFR 61.357(c)].

iii. If the total annual benzene quantity from facility waste is equal to or greater than 10 Mg/yr (11 ton/yr), then the owner or operator shall submit to the Illinois EPA and the Administrator reports described in 40 CFR 61.357(d) [40 CFR 61.357(d)].

d. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations by the affected coke by-product recovery plant, COG system and COG flare from applicable requirements, unless a NESHAP standard specifies a different timeframe, as follows:

A. Requirements in Condition 7.3.3(e), (f) and (g).

B. Requirements in Condition 7.3.6.

C. Requirements in Condition 7.3.7.

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

iii. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

iv. All required deviation reports described in Condition 7.3.11(d) above shall contain the following information:

A. Date, time and duration of the deviation;

B. Description of the deviation;

C. Probable cause of the deviation; and

D. Any corrective action or preventive measures taken.

e. Reporting on the State malfunction and breakdown authorization shall be performed in accordance with Condition 5.10.5-2.

f. Reporting on the Federal SSM authorization shall be performed in accordance with Condition 5.10.5-3.

7.3.12 Operational Flexibility/Anticipated Operating Scenarios

The following requirements established by Construction Permit 09030019 shall be followed during idling of the affected coke batteries and coke by-product recovery plant:

This permit authorizes operation of adsorber systems to control emissions from the equipment in the Coke By-Product Recovery Plant, as an alternative to the various blanketing systems on the by-products plant during idling or other interruptions in

these blanketing systems, as addressed by Permit 09030019, subject to the following requirements:

a. Each system will use a canister-type vessel containing activated carbon to “filter” organic material from the exhaust from the units. The adsorber vessels will not be regenerated on-site but replaced when the capacity of the vessel to adsorb organic material is approached.

b. Various equipment or affected operations at the by-products plant, including processing vessels such as tar decanters, light oil decanters and storage tanks which are subject to NESHAP (the associated operations).

i. The affected adsorbers shall be designed and operated to achieve at least 98 percent control of emissions of benzene from the associated operations, as required by 40 CFR 61.139(a), with compliance determined in accordance with applicable requirements of 40 CFR 61.139(b) and (h).

ii. As the by-products plant is subject to 40 CFR 61, Subpart L, the Permittee will continue to be subject to applicable requirements of 40 CFR 61, Subpart A, General Provisions for associated operations, including 40 CFR 61.12(c), which requires that the Permittee maintain and operate these operations, including associated equipment for air pollution control, in a manner consistent with good air pollution control practice for minimizing emissions.

iii. A. The Permittee shall have access to sampling equipment and other capabilities necessary to conduct monitoring for the affected adsorbers, i.e., operational measurements for the concentration of benzene or hydrocarbons in the exhaust from the adsorbers.

B. While the adsorbers serve to control emissions from the associated operations, the Permittee shall conduct applicable monitoring for the affected adsorbers required by 40 CFR 61, Subparts A and L, including 40 CFR 61.139(e).

iv. For the associated operations while controlled by the adsorbers, the Permittee shall fulfill applicable recordkeeping requirements of 40 CFR 61, Subparts A and L, including 40 CFR 61.139(i).

v. The Permittee shall keep a file for each adsorber system that contains documentation for the adsorption capacity of the adsorption vessel and engineering calculations for the rate at which the associated operations would generate emissions and the expected operating life of an adsorption vessel in days.

vi. The operating records that the Permittee maintains for the associated operations and adsorbers shall include the following information, in addition to other required information:

A. The date that an adsorber vessel is switched out, with reason and measured hydrocarbon concentration in the exhaust prior to switchout.

B. For periods when the adsorbers operated properly, i.e., in accordance with Condition 7.3.12(a), relevant information to generally confirm proper operation.

C. For periods when an adsorber did not operate properly, identification of each such period and the associated operations that were operating, with detailed information describing: 1) The operation of the adsorber, including the monitored exhaust concentration; 2) The potential consequences for additional emissions of organic material with an estimate of the additional emissions, with explanation; 3) The actions taken to restore proper operation; and 4) Any actions taken to prevent similar events in the future.

vii. The maintenance records that the Permittee maintains for the associated operations and adsorbers shall include the following information, in addition to other required information:

A. Until the operations are idled, date and time that an inspection or maintenance/repair activity on the units was performed, with description of activity and name(s) of the responsible personnel.

B. While the associated operations are idled, date and time that an inspection or maintenance/repair activity for the preservation measures on the operations was performed, with description of activity and name(s) of the responsible personnel.

viii. The Permittee shall fulfill applicable reporting requirements of 40 CFR 61, Subparts A and L, for the associated operations while they are controlled by the affected adsorbers.

ix. The Permittee shall notify the Illinois EPA of the following events for the coke by-product plant:

A. The date that existing control systems for the plant are shut off, within 15 days of such date. This report shall describe any difficulties that were encountered in the transition to control with the affected adsorbers, confirm the integrity of the ductwork of each affected adsorber, and include the results of initial measurements for the hydrocarbon concentrations in the exhaust from each affected adsorber, conducted in accordance with Condition 7.3.12(a).

B. The date that operation of all adsorbers is no longer required by 40 CFR 61, Subpart L, within 30 days of such date. This report shall indicate the date when the emptying and cleaning of each group of the associated operations was completed, the current status of each affected adsorber (i.e., physically removed from the plant, scheduled to be removed, or left in place pending further developments), and the actions that are planned to maintain the condition and integrity of the affected associated operations while they are idle.

Note: During a period when the affected plant is idle, even if all associated operations are cleaned and emptied, the Permittee must continue to submit the routine semiannual compliance reports required by 40 CFR 61, Subpart L.

C. The date that resumption of normal operation of the by-product plant is planned, at least 10 days prior to such date. This report shall generally describe the sequence of events that will accompany resumption of operation of the existing control systems for the plant.

7.3.13 Compliance Procedures

For the affected coke by-product recovery plant, COG system and COG flare, compliance with Conditions 7.3.3 and 7.3.7 is addressed by the work practices, testing, monitoring, recordkeeping and reporting requirements in Section 7.3 of this permit.

7.3.14 State-Only Conditions

State-only conditions are not being established.

7.4 Blast Furnaces

7.4.1 Description

Blast Furnaces and Casthouse:

Iron ore is converted to molten iron in the “A” and “B” Blast Furnaces. Iron ore, coke and a variety of fluxes (collectively called the burden) are charged into the top of the furnace, while heated air is blown up through the burden at a high velocity. Molten iron and slag accumulate in the bottom of the furnace, where a taphole is periodically drilled. The molten iron and slag pour out of the furnace into a trough, where the slag is separated from the iron. The iron moves down runners until it pours into torpedo cars. From here, the iron is taken to the Basic Oxygen Furnace (BOF) shop, where it is converted into steel. The slag travels down a separate runner and dumps into the slag pits. The molten slag is quenched with a mixture of water and potassium permanganate solution.

Charging of the Blast Furnace generates particulate matter emissions. Each furnace has a double-bell system to minimize emissions from charging.

Casthouse emissions consisting of particulate matter, sulfur dioxide, nitrogen oxides, carbon monoxide, and organic materials are generated during tapping of the furnace and the miscellaneous operations that take place within the casthouse structure. Emissions are controlled by the Casthouse Baghouse and the Iron Spout Baghouse.

Emissions may also be discharged from a blast furnace during startup, malfunctions and shutdowns for routine maintenance. Each furnace is equipped with bleeder valves which will relieve to the atmosphere if the furnace becomes over pressurized. This can occur during furnace slops when material in the furnace bridges forming a void and then collapses. Slips can cause over pressurization. In this condition, the stock in the furnace will bridge and cause a void to develop. The void will increase until the bridge collapses. Backdrafting of the blast furnaces is conducted to perform certain repairs, both routine and non-routine. Steam is utilized to draw furnace gases back through the tuyeres and out of backdraft stacks.

Blast Air Stoves:

The blast air stoves heat the blast air for the blast furnaces. Emissions from the stoves consist of particulate matter, sulfur dioxide, nitrogen oxides, and carbon monoxide generated as by-products of the combustion of Blast Furnace Gas (BFG) and Coke Oven Gas (COG). In addition, the blast furnaces can also use fuel oil in the event that other fuels are not available.

The byproduct gases from the blast furnaces are first cleaned in a BFG Pretreatment system with mechanical separation and water

wash to remove entrained dust and are then combusted in the stoves for the blast furnaces and other units at the source. BFG is primarily made up of carbon monoxide. The heat generated by the combustion of these gases is used to heat the brick inside of the stoves. The air flow is switched and this stored heat is then transferred to the blast air that is blown into the blast furnaces as part of the iron making process. There are three stoves for each furnace, which enables a continuous supply of blast air to the blast furnace. Only two of the three stoves will burn at any given time. All three stoves are exhausted to a common stack.

Excess BFG is also used in the various other fuel combustion emission units at the source. BFG that cannot be used as fuel is flared in either BFG flare #1 or #2.

Note: This narrative description is for informational purposes only and is not enforceable.

7.4.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
Blast Furnaces	• Blast Furnaces (A and B including charging and BFG pretreatment system)	Before 1972	None
	• Blast Furnace Casthouse (Tapping, Iron and Slag Runner, Slag Pits and Torpedo Car Loading Emissions From A and B Furnaces)		Casthouse Baghouse; and Iron Spout Baghouse;
	• Blast Furnace Gas Flare #1		None
	• (6) Blast Air Stoves (BFG,COG and natural Gas) (3 per each furnace)	Before 1972	None
	• Blast Furnace Gas Flare #2	2008	None
	• Slag pits	Before 1972	None

7.4.3 Applicable Provisions

a. The “affected blast furnace processes” for the purpose of these unit-specific conditions, are the emission units and activities described in Conditions 7.4.1 and 7.4.2.

b. Pursuant to 35 IAC 212.445, emissions of PM shall not exceed the following limits:

i. Uncaptured particulate matter from any opening in a blast furnace cast house shall not exceed 20 percent opacity on a six (6) minute rolling average basis beginning from initiation of the opening of the tap hole up to the point where the iron and slag stops flowing in the trough. Opacity observations shall be taken in accordance with the procedures of 40 CFR 60, Appendix A, Method 9 [35 IAC 212.445(a)].

ii. A. Particulate matter emissions from control equipment used to collect any of the emissions from the tap hole, trough, iron or slag runners or iron or slag spouts shall not exceed 0.023 g/dscm (0.010 gr/dscf). Compliance with this standard shall be determined in accordance with the procedures set out in 40 CFR 60, Appendix A, Methods 1 through 5, incorporated by reference in 35 IAC 212.113 and shall be based on the duration of a cast. For this purpose, a cast is defined as the initiation of the opening of the tap hole up to the point where the iron and slag stop flowing through the trough consistent with 35 IAC 212.445(a)(i) [35 IAC 212.445(b)(1)].

B. The opacity of emissions from control equipment used to collect any of the particulate matter emissions from the tap hole, trough, iron or slag runners or iron or slag spouts shall not exceed 10 percent on a six (6) minute rolling average basis [35 IAC 212.445(b)(2)].

c. Pursuant to 35 IAC 214.301, the affected blast furnace processes shall comply with the following: no person shall cause or allow the emission of sulfur dioxide into the atmosphere from any process emission source to exceed 2000 ppm.

d. The affected blast furnace processes other than the cast house are subject to 35 IAC 212.123(a), which provides that no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to the requirements of 35 IAC 212.122, except as allowed by 35 IAC 212.123(b) and 212.124.

e. Pursuant to 40 CFR 63.7790(a) and Paragraph 7 of Table 1, of 40 CFR 63 Subpart FFFFF, the emissions shall not exceed the following limits from each casthouse at an existing blast furnace:

i. Particulate matter emissions from a control device shall not exceed 0.01 gr/dscf; and

ii. Any secondary emissions that exit any opening in the casthouse or structure housing the blast furnace shall not exceed opacity greater than 20 percent (6 minute average).

f. Pursuant to 40 CFR 63.7790(b)(1), the Permittee must operate each capture system applied to emissions from blast furnace casthouse at or above the lowest value or settings established for the operating limits in the Permittee's operation and maintenance plan.

g. Pursuant to 35 IAC 212.316(f), uncaptured particulate matter emissions from blast furnace charging shall not exceed opacity of 20 percent.

h. Pursuant to 35 IAC 212.458(b)(7) and (c), blast furnace stoves shall comply with the following: No person shall cause or allow emissions of PM_{10} into the atmosphere to exceed 22.9 mg/scm (0.01 gr/scf) during any one hour period, provided that this limit shall not apply if there are no visible emissions, except if a stack test is performed, the absence of visible emissions is not a defense to a finding violation.

7.4.4 Non-Applicability of Regulations of Concern

a. The emission limitations of 35 IAC 212.324 are not applicable to any affected blast furnace processes that are subject to a specific emissions standard or limitation contained in 35 IAC Part 212 Subpart R, Primary and Fabricated Metal Products and Machinery Manufacture, pursuant to 35 IAC 212.324 (a)(3).

b. The affected blast furnace processes are not subject to 35 IAC 212.321 and 35 IAC 212.322, pursuant 35 IAC 212.441, which provides that, except where noted, 35 IAC 212.321 and 212.322 shall not apply to the steel manufacturing processes subject to 35 IAC 212.442 through 35 IAC 212.452.

c. This permit is issued based on the affected blast furnace processes not being subject to the applicable requirements of 35 IAC 219.301 because the affected processes do not emit photochemically reactive organic material as defined in 35 IAC 211.4690.

d. The affected blast furnace processes are not subject to 35 IAC 216.121 because the affected blast furnace processes are not the fuel combustion emission sources, as defined 35 IAC 211.2470.

e. Pursuant to 40 CFR 63.7491(g), the Blast Furnace Stoves are not subject to any applicable requirements in 40 CFR Part

63, Subpart DDDDD, NESHAP: Industrial, Commercial, and Institutional Boilers and Process Heaters.

7.4.5-1 Work Practices: Operation and Maintenance Plan (40 CFR 63.7800)

a. As required by 40 CFR 63.6(e)(1)(i), the Permittee shall always operate and maintain the affected blast furnace processes that are subject 40 CFR 63 Subpart FFFFF, including air pollution control and monitoring equipment, in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by 40 CFR 63 Subpart FFFFF.

b. The Permittee shall prepare and operate at all times each capture system or control device according to a written operation and maintenance plan for affected blast furnace casthouse. Each written operation and maintenance plan shall address the following elements:

i. Monthly inspections of the equipment that is important to the performance of the total capture system (*e.g.*, pressure sensors, dampers, and damper switches). This inspection must include observations of the physical appearance of the equipment (*e.g.*, presence of holes in ductwork or hoods, flow constrictions caused by dents or accumulated dust in the ductwork, and fan erosion). The operation and maintenance plan also must include requirements to repair any defect or deficiency in the capture system before the next scheduled inspection.

ii. Preventative maintenance for each control device, including a preventative maintenance schedule that is consistent with the manufacturer’s instructions for routine and long-term maintenance.

iii. Operating limits for each capture system applied to emissions from a blast furnace casthouse. The Permittee shall establish the operating limits according to the following requirements in 40 CFR 63.7800(b)(3)(i) through (iii):

A. Select operating limit parameters appropriate for the capture system design that are representative and reliable indicators of the performance of the capture system. At a minimum, the Permittee shall use appropriate operating limit parameters that indicate the level of the ventilation draft and the damper position settings for the capture system when operating to collect emissions, including revised settings for seasonal variations.

Appropriate operating limit parameters for ventilation draft include, but are not limited to, volumetric flow rate through each separately ducted hood, total volumetric flow rate at the inlet to the control device to which the capture system is vented, fan motor amperage, or static pressure.

B. For each operating limit parameter selected as described above, the Permittee shall designate the value or setting for the parameter at which the capture system operates during the process operation. If the operation allows for more than one process to be operating simultaneously, the Permittee shall designate the value or setting for the parameter at which the capture system operates during each possible configuration that the source may operate.

C. Include documentation in the plan to support selection of the operating limits established for the capture system. This documentation must include a description of the capture system design, a description of the capture system operating during production, a description of each selected operating limit parameter, a rationale for why the Permittee chose the parameter, a description of the method used to monitor the parameter according to the requirements of 40 CFR 63.7830(a), and the data used to set the value or setting for the parameter for each process configurations.

iv. Pursuant to 40 CFR 63.7800(b)(4), corrective action procedures for baghouses equipped with bag leak detection systems. In the event a bag leak detection system alarm is triggered, the Permittee shall initiate corrective action to determine the cause of the alarm within 1 hour of the alarm, initiate corrective action to correct the cause of the problem within 24 hours of the alarm, and complete the corrective action. Corrective actions may include, but are not limited to:

A. Inspecting the baghouse for air leaks, torn or broken bags or filter media, or any other condition that may cause an increase in emissions [40 CFR 63.7800(b)(4)(i)].

B. Sealing off defective bags or filter media [40 CFR 63.7800(b)(4)(ii)].

C. Replacing defective bags or filter media or otherwise repairing the control device [40 CFR 63.7800(b)(4)(iii)].

D. Sealing off a defective baghouse compartment [40 CFR 63.7800(b)(4)(iv)].

E. Cleaning the bag leak detection system probe, or otherwise repair the bag leak detection system [40 CFR 63.7800(b)(4)(v)].

F. Shutting down the process producing the particulate emissions [40 CFR 63.7800(b)(4)(vi)].

7.4.5-2 Work Practices: Startup, Shutdown and Malfunction

a. Provisions Related to 40 CFR 63, Subpart FFFFF

i. Pursuant to 40 CFR 63.7810, the Permittee must be in compliance with the emission limitations and operation and maintenance requirements in 40 CFR 63 Subpart FFFFF at all times, except during periods of startup, shutdown and malfunction as defined in 40 CFR 63.2

ii. Pursuant to 40 CFR 63.7810(c), the Permittee shall develop a written startup, shutdown, and malfunction plan for the affected blast furnaces and casthouses according to the provisions established in 40 CFR 63.6(e)(3).

iii. Pursuant to 40 CFR 63.7835, consistent with 40 CFR 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if the Permittee demonstrates that it was operating in accordance with 40 CFR 63.6(e)(1).

iv. The Permittee shall fulfill the applicable reporting requirements identified in 40 CFR 63.10(d) (Condition 5.10.5(b)) and 40 CFR 63.7841(b)(4).

v. The Permittee shall keep records in accordance with 40 CFR 63.7842(a)(2) related to startup, shutdown and malfunction.

b. Startup and Malfunction/Breakdown Authorizations

i. Malfunction and Breakdown, pursuant to 201.149 and Part 201, Subpart I

A. Subject to the following terms and conditions, the Permittee is authorized to continue operation of the affected blast furnace processes in excess of the applicable state standards in 35 IAC 212.445(b)(1) in the event of a malfunction or breakdown. This shall include blast furnace over pressurization, slips, use of auxiliary tap-holes, and back-drafting associated with periods of malfunction and breakdown.

   Note: This authorization is provided because the Permittee applied for such authorization in its CAAPP application, generally explaining why such continued operation would be required to prevent injury to personnel or severe damage to equipment, and describing the measures that will be taken to minimize emissions from any malfunctions and breakdowns.

B. This authorization only allows such continued operation as necessary to prevent injury to personnel or severe damage to equipment and does not extend to continued operation solely for the economic benefit of the Permittee.

C. Upon occurrence of excess emissions due to malfunction or breakdown, the Permittee shall repair the affected emission/process units and/or re-establish applicable control practices.

D. The Permittee shall fulfill the applicable recordkeeping and reporting requirements of Conditions 7.4.9(e) and 5.10.5-2, respectively. For these purposes, time shall be measured from the start of a particular incident. The absence of excess emissions for a short period shall not be considered to end the incident if excess emissions resume.

E. Following notification to the Illinois EPA (see Condition 5.10.5-2(a)(ii))of a malfunction or breakdown with excess emissions, the Permittee shall comply with all reasonable directives of the Illinois EPA with respect to such incident.

F. This authorization does not relieve the Permittee from the continuing obligation to minimize excess emissions during malfunction or breakdown. As provided by 35 IAC 201.265, an authorization in a permit for continued operation with excess emissions during malfunction and breakdown does not shield the

Permittee from enforcement for any such violation and only constitutes a prima facie defense to such an enforcement action provided that the Permittee has fully complied with all terms and conditions connected with such authorization.

ii. Startup, pursuant to 35 IAC 201.149 and Part 201, Subpart I

A. Subject to the following terms and conditions, for the affected blast furnace, the Permittee is authorized to violate the applicable standards of 35 IAC 212.445(b)(1), 212.445(b)(2) and 35 IAC 214.301 during startup.

Note: This authorization is provided because the Permittee applied for such authorization in its CAAPP application, generally describing the efforts that will be used "…to minimize startup emissions, duration of individual starts, and frequency of startups".

B. This authorization does not relieve the Permittee from the continuing obligation to demonstrate that all reasonable efforts are made to minimize startup emissions, duration of individual startups and frequency of startups.

C. The Permittee shall follow the written startup, shutdown, and malfunction plan for the affected blast furnace processes prepared pursuant to 40 CFR 63.6(e)(3) and Condition 7.4.5-2. In addition, the Permittee shall also review the operating condition of the affected blast furnace process prior to initiating startup.

D. The Permittee shall fulfill applicable recordkeeping requirements of Condition 7.4.9(d).

E. The Permittee shall fulfill applicable reporting requirements of Condition 5.10.5-1.

F. As provided by 35 IAC 201.265, an authorization in a permit for excess emissions during startup does not shield a Permittee from enforcement for any violation of applicable emission standard(s) that occurs during startup and only constitutes a prima facie defense to such an enforcement action provided that the Permittee has fully complied with all terms and conditions connected with such authorization.

7.4.5-3 Work Practices from State Permits

a. Except during periods of runner maintenance, the hot metal runners and the short slag runner shall be covered with permanent type runner covers [72080034, 72080036, T1].

b. Water spraying of the slag for the purpose of cooling and minimizing slag load-out emissions will take place after completion of the slagging operation and prior to slag-loadout [85030039, T1].

c. BFG flare #1 shall be operated with no visible emissions as determined by USEPA Method 22, except for periods not to exceed a total of 5 minutes during any 2 consecutive hours [0607023, T1].

d. Requirements for BFG Flare #2 from Permit 06070023:

i. BFG flare #2 shall be operated to comply with the following equipment work practices [T1]:

A. BFG flare #2 shall be operated with no visible emissions as determined by the methods specified in 40 CFR 60.18(f), except for periods not to exceed a total of 5 minutes during any 2 consecutive hours.

B. BFG flare #2 shall be operated with a flame present at all times.

ii. Emissions of PM and PM_{10} from BFG flare #2 shall be controlled by the existing BFG pretreatment system, which entails treatment by dust catchers and wet scrubbers [T1].

iii. BFG and natural gas shall be the only fuels combusted in BFG flare #2 [T1].

7.4.5-4 Other Work Practices

The following requirements are established pursuant to Section 39.5(7)(a) of the Act:

a. The Permittee shall maintain the double-bell system of the blast furnaces in order to minimize emissions from furnace charging.

b. The Permittee shall develop and implement operating practices plan for slag handling processing associated with the slag pits for minimizing emissions and keeping them below the levels established in Condition 7.4.6(e).

7.4.6 Production and Emission Limitations from Existing Permits

a. i. Total combined production of hot metal (a.k.a., iron) from blast furnaces A and B shall not exceed 9,849 net tons per day, averaged over any calendar month [72080034,7208036,95010001, T1]; and

ii. Maximum amount of pellets charged shall not exceed 4,308,581 tons/yr [95010001, T1].

b. Casthouse Baghouse emissions shall not exceed the following limits [95010001, T1]:

Pollutant	Emission Factors (Lbs/Ton Iron)	Maximum Emissions (Tons/Yr)
PM	0.0703	111.19
PM_{10}	0.0703	111.19
SO_2	0.2006	422.00
NO_x	0.0144	22.79
VOM	0.0946	149.68

c. Blast Furnace uncaptured fugitives emissions shall not exceed the following limits [95010001, T1]:

Pollutant	Emission Factors (Lbs/Ton Iron)	Maximum Emissions (Tons/Yr)
PM	0.031	49.06
PM_{10}	0.0155	24.53
SO_2	0.0104	21.94
NO_x	0.0007	1.14
VOM	0.0047	7.42

d. Blast Furnace Charging emissions shall not exceed the following limits [95010001, T1]:

Pollutant	Emission Factors (Lbs/Ton Pellets)	Maximum Emissions (Tons/Yr)
PM	0.0024	5.17
PM_{10}	0.0024	5.17

e. Slag Pits emissions shall not exceed the following limits [95010001, T1]:

Pollutant	Emission Factors (Lbs/Ton Iron)	Maximum Emissions (Tons/Yr)
PM	0.00417	6.60
PM_{10}	0.00417	6.60
SO_2	0.0100	15.83

f. Iron Spout Baghouse emissions shall not exceed the following limits [95010001, T1]:

Pollutant	Emission Factors (Lbs/Ton Iron)	Maximum Emissions (Tons/Yr)
PM	0.02548	40.32
PM_{10}	0.02548	40.32
SO_2	0.0073	13.89

g. Total emissions from blast furnace operations shall not exceed the following limits, tons/yr [95010001, T1]:

	PM*	PM_{10}*	SO_2	NO_x	VOM
Blast Furnace Operations	212	188	474	24	157

* Limit does not address the iron pellet screen (See Section 7.1)

h. Compliance with the daily limit of Condition 7.4.6(a)(i) shall be determined from a monthly total of the relevant daily data divided by the number of days in the month [95010001].

i. Compliance with the annual limits of Condition 7.4.6(a)(2) and Conditions 7.4.6(b) through (g) shall be determined based on a calendar year [95010001].

j. Overlapping casting of “A” and “B” Blast Furnaces shall not exceed a casting rate of 6 tons per minute per furnace [72080034 and 7208036, T1].

k. The PM content of the BFG burned at the facility shall not exceed 0.01 grains/dscf [06070023, T1].

7.4.7 Testing Requirements

a. Blast furnace casthouse pursuant to NESHAP.

The Permittee shall comply with the following testing requirements pursuant to 40 CFR Part 63 Subpart FFFFF:

i. Pursuant to 40 CFR 63.7821(c), for each emissions unit equipped with a baghouse, the Permittee must conduct performance tests no less frequently than once every five years.

ii. Test methods for compliance demonstration with the emission limits for particulate matter [40 CFR 63.7822(b)]:

A. Determine the concentration of particulate matter according to the following test methods in Appendix A to 40 CFR Part 60.

1. Method 1 to select sampling port locations and the number of traverse points. Sampling sites must be located at the outlet of the control device and prior to any releases to the atmosphere.

2. Method 2, 2F, or 2G to determine the volumetric flow rate of the stack gas.

3. Method 3, 3A, or 3B to determine the dry molecular weight of the stack gas.

4. Method 4 to determine the moisture content of the stack gas.

5. Method 5, 5D, or 17, as applicable, to determine the concentration of particulate matter (front half filterable catch only).

B. Collect a minimum sample volume of 60 dry standard cubic feet (dscf) of gas during each particulate matter test run. Three valid test runs are needed to comprise a performance test.

iii. Test methods for compliance demonstration with the opacity limits [40 CFR 63.7823(b) and (c)]:

A. The Permittee shall conduct each visible emissions performance test such that the opacity observations overlap with the performance test for particulate matter [40 CFR 63.7823(b)].

B. To determine compliance with the applicable opacity limit for a blast furnace casthouse, the Permittee shall:

1. Use a certified observer to determine the opacity of emissions according to Method 9 in Appendix A to 40 CFR Part 60.

2. Obtain a minimum of 30 6-minute block averages. For a blast furnace casthouse, the Permittee shall make observations during tapping of the furnace. Tapping begins when the furnace is opened, usually by creating a hole near the

bottom of the furnace, and ends when the hole is plugged.

b. Blast furnace casthouse.

The Permittee shall comply with the following testing requirements pursuant to Sections 39.5(7)(d) and (p) of the Act:

i. For uncaptured emissions (roof monitor) or secondary emissions:

A. The Permittee shall have the opacity (6-minute average), of the exhaust of the building housing the blast furnace casthouse determined by a qualified observer in accordance with USEPA Method 9 while the affected blast furnace(s) are being tapped, as further specified below.

B. The duration of opacity observations for each test shall be at least 30 minutes unless no visible emissions are observed as determined by USEPA Method 22 or the average opacities for the first 12 minutes of observations conducted for the point of release that displays the greatest opacity, 6-minute average, are both no more than 10.0 percent.

C. 1. Observations of opacity shall be conducted on the following frequency unless absence of adequate daylight or weather conditions preclude scheduled observation, in which case, the next observations shall be conducted on the next day during which observations of opacity can properly be conducted in accordance with USEPA Method 9:

I. On a weekly basis (at least once every 7 operating days of the casthouse) except as provided below.

II. On a daily basis (at least 5 days out of 7 operating days of the casthouse) if the maximum opacity observed during any of the five previous observations was 18 percent or more, 6-minute average, continuing on a daily basis until the maximum opacities measured in five consecutive daily observations are all less than 18 percent, 6-minute average, at which time

observations on a weekly basis shall resume.

2. Upon written request by the Illinois EPA, additional opacity observations shall be conducted within five operating days for the casthouse from the date of the request by the Illinois EPA or on the date agreed upon by the Illinois EPA, whichever is later. For such observations conducted pursuant to a request from the Illinois EPA:

I. The Permittee shall notify the Illinois EPA at least 24 hours in advance of the date and time of these observations, in order to enable the Illinois EPA to witness the observations. This notification shall include the name and employer of the qualified observer(s).

II. The Permittee shall promptly notify the Illinois EPA of any changes in the time or date for observations.

III. The duration of these observations shall cover a complete heat or cycle of the affected blast furnace.

IV. The Permittee shall provide a copy of the current certification for the opacity observer and observer’s readings to the Illinois EPA at the time of the observations, if the Illinois EPA personnel are present.

D. The Permittee shall keep records for all opacity measurements for the casthouse made in accordance with USEPA Method 9 that the Permittee conducts or that are conducted at its behest by individuals who are qualified to make such observations. For each occasion on which such measurements are made, these records shall include the formal report for the measurements if conducted pursuant to Condition 7.4.7(b)(i)(2), or otherwise the identity of the observer, a description of the measurements that were made, the operating condition of the casthouse, the observed opacity, and copies of the raw data sheets for the measurements.

ii. Emissions from control equipment [35 IAC 212.445(b)]:

A. Upon request from the Illinois EPA, compliance with emission limits of 35 IAC 212.445(b)(1)(see also Condition 7.4.3(b)(ii)(A)) shall be determined in accordance with the procedures set out in 40 CFR Part 60, Appendix A, Methods 1 through 5, incorporated by reference in 35 IAC 212.113, and shall be based on the arithmetic average of three runs. Calculations shall be based on the duration of a cast defined in 35 IAC 212.445(a)(1).

B. Upon request from the Illinois EPA, opacity readings, for verifying compliance with emission limit of 35 IAC 212.445(b)(2)(see also Condition 7.4.3(b)(ii)(B)), shall be taken in accordance with the observation procedures set out in 40 CFR part 60, Appendix A, Method 9, incorporated by reference in 35 IAC 212.113.

c. Additional Emission Testing for the Casthouse Baghouse and the Iron Spout Baghouse, pursuant to Sections 39.5(7)(d) and (p) of the Act:

i. As part of the emission testing required by Condition 7.4.7(a), the Permittee shall also measure the SO_2, NO_x and VOM emissions from each baghouse.

ii. The following USEPA Test Methods shall be used for testing of emissions, unless another USEPA Test Method is approved by the Illinois EPA.

Location of Sample Points	Method 1
Gas Flow and Velocity	Method 2
Flue Gas Weight	Method 3
Moisture	Method 4
SO_2	Method 6
NO_x	Method 7
VOM	Method 25

iii. For this emission testing, test notification and reporting shall be done by the Permittee in accordance with Conditions 8.6.2 and 8.6.3 of this permit.

d. BFG Flares:

Pursuant to Sections 39.5(7)(d) and (p) of the Act, the Permittee shall conduct observations for each BFG flare for the presence of visible emissions and/or opacity, using USEPA Method 22 and 9, respectively. These observations shall be conducted on at least a monthly basis for each

flare. In addition, observations shall be coordinated with weather conditions so that at least two observations are made in each calendar year during elevated wind speed conditions, i.e., wind speed of at least 16 miles per hour. These observations shall be conducted by individual(s) certified to observe opacity by USEPA Method 9. The observer(s) shall initially conduct observations for visible emissions. If any visible emissions are observed, the observations shall continue for two hours or until the cumulative duration of visible emissions exceeds ten minutes, whichever occurs first. If any visible emissions are observed, observations for opacity shall also be conducted.

7.4.8 Monitoring Requirements

a. Monitoring requirements pursuant to 40 CFR 63.7830(a)

For each capture system subject to an operating limit in 40 CFR 63.7790(b)(1) established in the Permittee’s capture system operation and maintenance plan, the Permittee must install, operate, and maintain a CPMS according to the following requirements:

Dampers that are manually set and remain in the same position are exempt from the requirement to install and operate a CPMS. If dampers are not manually set and remain in the same position, the Permittee shall make a visual check at least once every 24 hours to verify that each damper for the capture system is in the same position as during the initial performance test.

b. Monitoring requirements pursuant to 40 CFR 7830(b)(1)

The casthouse baghouse and iron spout baghouse shall each be equipped with a bag leak detection system which the Permittee shall operate and maintain according to the following requirements of 40 CFR 63.7831(f):

i. The system must be certified by the manufacturer to be capable of detecting emissions of particulate matter at concentrations of 10 milligrams per actual cubic meter (0.0044 grains per actual cubic foot) or less [40 CFR 63.7831(f)(1)].

ii. The system must provide output of relative changes in particulate matter loadings [40 CFR 63.7831(f)(2)].

iii. The system must be equipped with an alarm that will sound when an increase in relative particulate loadings is detected over a preset level. The alarm must be located such that it can be heard by the appropriate plant personnel [40 CFR 63.7831(f)(3)].

iv. Each system that works based on the triboelectric effect must be installed, operated, and maintained in a manner consistent with the guidance document, “Fabric Filter Bag Leak Detection Guidance,” EPA–454/R–98–015, September 1997 [40 CFR 63.7831(f)(4)].

v. Following the initial adjustment, do not adjust the sensitivity or range, averaging period, alarm set points, or alarm delay time, except as detailed in your operation and maintenance plan. Do not increase the sensitivity by more than 100 percent or decrease the sensitivity by more than 50 percent over a 365-day period unless a responsible official certifies, in writing, that the baghouse has been inspected and found to be in good operating condition [40 CFR 63.7831(f)(6)].

c. The Permittee shall conduct inspections of each baghouse at the specified frequencies according to the following requirements [40 CFR 63.7830(b)(4)]:

i. Monitor the pressure drop across each baghouse cell each day to ensure pressure drop is within the normal operating range identified in the operation and maintenance plan manual.

ii. Confirm that dust is being removed from hoppers through weekly visual inspections or other means of ensuring the proper functioning of removal mechanisms.

iii. Check the compressed air supply for pulse-jet baghouses each day.

iv. Monitor cleaning cycles to ensure proper operation using an appropriate methodology.

v. Check bag cleaning mechanisms for proper functioning through monthly visual inspection or equivalent means.

vi. Make monthly visual checks of bag tension on reverse air and shaker-type baghouses to ensure that bags are not kinked (kneed or bent) or laying on their sides. You do not have to make this check for shaker-type baghouses using self-tensioning (spring-loaded) devices.

vii. Confirm the physical integrity of the baghouse through quarterly visual inspections of the baghouse interior for air leaks.

viii. Inspect fans for wear, material buildup, and corrosion through quarterly visual inspections, vibration detectors, or equivalent means.

d. Site-specific monitoring plan requirements pursuant to 40 CFR 63.7831(a)

For each CPMS required in 40 CFR 63.7830, the Permittee shall develop and make available for inspection upon request by the Illinois EPA a site-specific monitoring plan that addresses the following requirements of 40 CFR 63.7831(a)(1) through (a)(6), including:

i. Installation of the CPMS sampling probe or other interface at a measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (*e.g.*, on or downstream of the last control device) [40 CFR 63.7831(a)(1)];

ii. Performance and equipment specifications for the sample interface, the parametric signal analyzer, and the data collection and reduction system [40 CFR 63.7831(a)(2);

iii. Performance evaluation procedures and acceptance criteria (*e.g.*, calibrations) [40 CFR 63.7831(a)(3);

iv. Ongoing operation and maintenance procedures in accordance with the general requirements of 40 CFR 63.8(c)(1), (c)(3), (c)(4)(ii), (c)(7), and (c)(8) [40 CFR 63.7831(a)(4);

v. Ongoing data quality assurance procedures in accordance with the general requirements of 40 CFR 63.8(d) [40 CFR 63.7831(a)(5); and

vi. Ongoing recordkeeping and reporting procedures in accordance with the general requirements of 40 CFR 63.10(c), (e)(1), and (e)(2)(i) [40 CFR 63.7831(a)(6).

e. Pursuant to 40 CFR 63.7831(b), unless otherwise specified by the NESHAP, each CPMS must:

i. Complete a minimum of one cycle of operation for each successive 15-minute period and collect a minimum of three of the required four data points to constitute a valid hour of data;

ii. Provide valid hourly data for at least 95 percent of every averaging period; and

iii. Determine and record the hourly average of all recorded readings.

f. Pursuant to 40 CFR 63.7831(c), the Permittee shall conduct a performance evaluation of each CPMS in accordance with the site-specific monitoring plan.

g. Pursuant to 40 CFR 63.7831(d), the Permittee shall operate and maintain the CPMS in continuous operation according to the site-specific monitoring plan.

h. Pursuant to 40 CFR 63.7790(b)(1) and 63.7800(b)(3)(i), the Permittee shall operate each capture system applied to emissions from a blast furnace casthouse at or above the lowest value or settings as established in the Permittee's operation and maintenance plan and which are currently as follows:

i. Casthouse Baghouse:

A. Motor amperage (total), both blast furnaces casting: 245 amps

B. Motor amperage, one blast furnace casting: 125 amps

ii. Iron Spout Baghouse:

A. Motor amperage, both blast furnaces casting (total): 245 amps

B. Motor amperage, one blast furnace casting: 131 amps

C. Blast Furnace A iron spout damper positions (3): 2 or less open all of the time; 3 open less than 5 minutes

D. Blast Furnace B tilting runner damper position: open

i. Pursuant to 40 CFR 63.7824(c), the Permittee may change the operating limits for the capture system if the Permittee meets the following requirements:

i. Submits a written notification to the Illinois EPA of the Permittee's request to conduct a new performance test to revise the operating limit.

ii. Conducts a performance test to demonstrate compliance with the applicable emission in Table 1 to 40 CFR 63 Subpart FFFFF.

iii. Establishes revised operating limits according to the applicable procedures in 40 CFR 63.7824(a).

j. Monitoring and Collecting Data pursuant to 40 CFR 63.7832:

i. Except for monitoring malfunctions, out-of-control periods as specified in 40 CFR 63.8(c)(7), associated repairs, and required quality assurance or control activities (including as applicable, calibration checks and required zero and span adjustments), the Permittee shall monitor continuously (or collect data at all required intervals) at all times an affected source is operating.

ii. The Permittee may not use data recorded during monitoring malfunctions, associated repairs, and required quality assurance or control activities in data averages and calculations used to report emission or operating levels or to fulfill a minimum data availability requirement, if applicable. The Permittee shall use all the data collected during all other periods in assessing compliance.

iii. A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions.

k. Pursuant to the operation and maintenance requirements of the O/M plan required by 40 CFR 63.7800(b), the Permittee shall comply with following inspection procedures for the capture systems:

Monthly inspections of the equipment that is important to the performance of the total capture system. This inspection must include observations of the physical appearance of the equipment (e.g., presence of holes in ductwork or hoods, flow constrictions caused by dents or accumulated dust in the ductwork, and fan erosion). Repair of any defect or deficiency in the capture system shall be done before the next scheduled inspection.

l. Inspection and Monitoring for BFG Flares [Section 39.5(7)(d) of the Act]

i. For BFG flare #1, the Permittee shall either:

A. Install, operate and maintain instrumentation, with alarm, to confirm the presence of a flame at the flare tip; or

B. Monitor the presence of a pilot flame in accordance with Condition 7.4.8(l)(ii); or

C. Verify daily, the following to ensure BFG flare #1 is operating: The presence of a flame or thermal plume at the tip of the flare and that the flare gas header has a positive pressure.

ii. For BFG flare #2, the Permittee shall monitor the presence of a flare pilot flame using a thermocouple or other equivalent device to detect the presence of a flame.

iii. The Permittee shall perform detailed inspections of each BFG flare every 18 months. These inspections shall include all maintenance and repair activities performed based on the inspection results. If the flare cannot be inspected within 18 months, as required, the Permittee may request in writing from IEPA's Permit Section an extension of time to complete this inspection. The request for an extension must be supported with adequate justification for the extension and an assurance that the flare is continuing to operate without any problems. Under no circumstances shall the extension go beyond an additional 6 months.

m. Pursuant to Permits 72080034 and 72080036 [T1]:

i. The Permittee shall maintain and operate a pressure drop continuous recording system on the casthouse baghouse. The recorded data shall be retained for a period of six months shall be made available to the Illinois EPA personnel upon request.

ii. The Permittee shall maintain and operate a continuous pressure drop recording system on the iron spout baghouse.

n. The Permittee shall conduct observations for opacity for operations associated with the blast furnace in accordance with USEPA Method 9 for a minimum of 30 minutes for each operation unless no visible emissions are observed during the first 12 minutes of observations:

i. Blast furnace charging: Annually

ii. Blast furnace stoves stacks: Semiannually

iii. Slag pits: Quarterly

7.4.9 Recordkeeping Requirements

The Permittee shall maintain records of the following items for the affected Blast Furnaces Processes, pursuant to Sections 39.5(7)(a), (e) and (p) of the Act:

a. 40 CFR Part 63 Subpart FFFFF (40 CFR 63.7842 and 63.7843):

i. The Permittee shall keep the following records, as specified in 40 CFR 63.7842 (a)(1) through (a)(3):

A. A copy of each notification and report that the Permittee submitted to comply with 40 CFR 63 Subpart FFFFF, including all documentation supporting any initial notification or notification of compliance status that the Permittee submitted, according to the requirements in 40 CFR 63.10(b)(2)(xiv).

B. The records in 40 CFR 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction.

C. Records of performance tests, performance evaluations, and opacity observations as required in 40 CFR 63.10(b)(2)(viii).

ii. The Permittee shall keep the records in 40 CFR 63.6(h)(6) for visual observations.

iii. The Permittee shall keep the records required in 40 CFR 63.7833 and 63.7834 (including a current copy of the operation and maintenance plan) to show continuous compliance with each emission limitation and operation and maintenance requirement that applies to the Permittee.

iv. The Permittee shall keep its records in a form suitable and readily available for expeditious review, according to 40 CFR 63.10(b)(1).

v. As specified in 40 CFR 63.10(b)(1), the Permittee shall keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

vi. The Permittee shall keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report,

or record, according to 40 CFR 63.10(b)(1). The Permittee may keep the records offsite for the remaining 3 years.

b. 40 CFR Part 63 Subpart FFFFF [40 CFR 63.7834(b)]:

The Permittee shall maintain a current copy of the operation and maintenance plan required in 40 CFR 63.7800(b) onsite and available for inspection upon request.

c. The following records of Permits #72080034, #72080036 and #95010001:

i. The Permittee shall maintain records for each beaching event in which iron is beached that, as a minimum, shall include:

A. An explanation why beaching occurred.

B. The date, time and duration of beaching.

C. The measures used to reduce the amount of beaching.

D. The maximum rate of beaching, tons/minute, (or information showing that the beaching rate did not exceed 20 tons/minute).

d. Records for Startups of Affected Blast Furnace Processes, pursuant to Section 39.5(7)(b) of the Act

i. The Permittee shall maintain startup procedures for each affected blast furnace process, as required by Condition 7.4.5-2(b)(ii)(C).

ii. The Permittee shall maintain the following records for each startup of an affected blast furnace process:

A. Date, time and duration of the startup.

B. A description of the startup and reason(s) for the startup.

C. Whether a violation of an applicable standard may have occurred during startup accompanied by the information in Condition 7.4.9(d)(iv) if a violation may have or did occur.

D. Whether the established startup procedures, maintained above, were followed accompanied by the information in Condition 7.4.9(d)(iii) if there were departure(s) from those procedures.

iii. If the established startup procedures were not followed during a startup, the Permittee shall maintain the following records:

A. A description of the departure(s) from the established procedures.

B. The reason(s) for the departure(s) from the established procedures.

C. An explanation of the consequences of the departure(s) for emissions, such as whether the departure(s) prolonged the startup or resulted in additional emissions, and if so,

1. The actions taken to minimize emissions and the duration of the startup; and

2. An explanation whether similar incidents might be prevented in the future and if so, the corrective actions taken or to be taken to prevent similar incidents.

iv. If a violation did or may have occurred during a startup, the Permittee shall maintain the following records:

A. Identification of the applicable standard(s) that were or may have been violated.

B. An explanation of the nature of such violation(s), including the magnitude of such excess emissions.

C. A description of the actions taken to minimize the magnitude of emissions and duration of the startup.

D. An explanation whether similar incidents could be prevented or ameliorated in the future and if so, a description of the actions taken or to be taken to prevent similar incidents in the future.

e. Records for Malfunctions or Breakdowns

Pursuant to 35 IAC 201.263, the Permittee shall maintain records of continued operation of the affected Blast Furnace Processes as addressed by Condition 7.4.5-2(b)(i), during malfunctions or breakdowns, which at a minimum, shall include the following records. The preparation of these records shall be completed within 45 days of an incident, unless the Permittee conducts a root cause analysis for the incident, in which case the preparation of

these records, other than the root cause analysis, shall be completed within 120 days of the incident.

i. Date, time and duration of the incident.

ii. A detailed description of the incident, including:

A. A chronology of significant events during and leading up to the incident.

B. Relevant operating data for the unit, including information such as operator log entries and directives provided by management during the incident.

C. The measures taken to reduce the quantity of emissions and the duration of the incident including the resources utilized to address the incident.

D. The magnitude of emissions during the incident.

iii. An explanation why continued operation of an affected blast furnace was necessary to prevent personnel injury or prevent equipment damage.

iv. A discussion of the cause(s) or probable cause(s) of the incident including the following:

A. Whether the incident was sudden, unavoidable, or preventable, including:

1. Why the equipment design did not prevent the incident;

2. Why better maintenance could not have avoided the incident;

3. Why better operating practices could not have avoided the incident; and

4. Why there was no advance indication for the incident.

B. Whether the incident stemmed from any activity or event that could have been foreseen, avoided or planned for.

C. Whether the incident was or is part of a recurring pattern indicative of inadequate design, operation or maintenance.

v. A description of any steps taken to prevent similar future incidents or reduce their frequency and severity.

vi. As an alternative to keeping the records required by Condition 7.4.9(e)(iv), the Permittee may perform a root cause analysis. For this purpose, a root cause analysis is an analysis whose purpose is to determine, correct and eliminate the primary causes of the incident and the excess emissions resulting there from. If the Permittee performs a root cause analysis method that would define the problem, define all causal relationships, provide a causal path to the root cause, delineate the evidence, and provide solutions to prevent a recurrence. Such an analysis shall be completed within one year of the incident.

f. Recordkeeping for Backdrafting.

The Permittee shall maintain records for each period when an affected blast furnace is backdrafted. These records shall include, at a minimum for each occurrence, the blast furnace identification, date and timeframe of backdraft, reason for backdrafting (e.g., planned shutdowns and/or routine maintenance), and steps taken to minimize emissions during the backdraft period.

g. Records for BFG Flares

The Permittee shall maintain the following records for BFG flares:

i. Records of opacity observations performed as required by Condition 7.4.7(d).

ii. Records of inspections and maintenance activities conducted pursuant to Condition 7.4.8(l).

iii. For BFG flare #2, date and duration of any time when the pilot flame monitoring equipment of the affected unit was not in operation, with explanation.

iv. Date and duration of any time when there was no pilot flame present at the flare, with explanation.

v. Date, duration and description of any other deviations.

h. The Permittee shall maintain the following operating records for the affected blast furnaces:

i. Monthly and annual usage of natural gas, blast furnace gas and coke oven gas (million ft^3) used by the affected blast furnace stoves.

ii. Blast Furnace hot metal production (total combined daily, monthly and annual in tons), including documentation on iron and slag losses.

iii. Records of iron pellets charged (tons/month and tons/year).

iv. Records of slag processed (tons/month and tons/year).

v. For overlapping tapping of both furnaces, records to demonstrate that the tapping rate of each furnace does not exceed 6 tons per minute.

vi. If the Permittee operates under manufacturer's specifications or manufacturer's instructions, the Permittee shall maintain such manufacturer's documentation, which shall be kept at the facility as part of the required records.

vii. Records identifying process upsets in the operations at the casthouse that result in the generation of additional opacity or PM emissions, such as refractory clay falling into the trough during a missed stop. For these upsets, these records shall include the time of the upset, a description of the upset and a discussion of the consequences for opacity and PM emissions from the casthouse.

i. The Permittee shall keep the following records related to the emissions of the affected blast furnace processes to verify compliance with the applicable limits in Condition 7.4.6(b) through (g):

i. A file containing the emission factors used by the Permittee to determine emissions of different pollutants from the various processes, with supporting documentation. These records shall be reviewed and updated by the Permittee as necessary to assure that the emission factors that it uses to determine emissions of the processes do not understate actual emissions, including review when emission testing is conducted for such processes. These records shall be prepared and copies sent to the Illinois EPA in accordance with Condition 5.9.6(c).

ii. Records for any periods of operation of such processes that are not otherwise addressed in the required records during which the established emission factor in Condition 7.4.9(i)(i) would understate actual emissions of the process, with description of the period of operation and an estimate of the additional emissions during such period that would not be accounted for by the established factor, with supporting explanation and calculations.

iii. Records for the annual emissions of such processes for comparison to the limits in Conditions 7.4.6(b) through (f), with supporting calculations.

iv. Records for combined annual emissions of the affected processes, based on the summation of the above data, for comparison to the limits in Condition 7.4.6(g).

7.4.10 Reporting Requirements

a. 40 CFR 63 Subpart FFFFF (40 CFR 63.7841):

i. Compliance report due dates. The Permittee shall submit the semiannual compliance reports to the Illinois EPA according to the following requirements:

A. Semi-annual compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

B. Each compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date comes first after the end of the semiannual reporting period.

ii. Compliance report contents. Each compliance report must include the following information:

A. Company name and address.

B. Statement by a responsible official, with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

C. Date of report and beginning and ending dates of the reporting period.

D. If the Permittee had a startup, shutdown, or malfunction during the reporting period and the Permittee took actions consistent with the source’s startup, shutdown, and malfunction plan, the compliance report must include the information in 40 CFR 63.10(d)(5)(i).

E. If there were no deviations from the continuous compliance requirements in 40 CFR 63.7833 and 63.7834 that apply to the Permittee, a statement that there were no deviations from the emission limitations or operation and

maintenance requirements during the reporting period.

F. If there were no periods during which a continuous monitoring system (including a CPMS, COMS, or continuous emission monitoring system (CEMS)) was out-of-control as specified in 40 CFR 63.8(c)(7), a statement that there were no periods during which the CPMS was out-of-control during the reporting period.

G. For each deviation from an emission limitation in 40 CFR 63.7790 that occurs at an affected source where the Permittee is not using a continuous monitoring system (including a CPMS, COMS, or CEMS) to comply with an emission limitation in Subpart FFFFF, the compliance report must contain the information described in Condition 7.4.10(a)(ii) and the following information (this includes periods of startup, shutdown, and malfunction):

1. The total operating time of each affected source during the reporting period.

2. Information on the number, duration, and cause of deviations (including unknown cause, if applicable) as applicable and the corrective action taken.

H. For each deviation from an emission limitation occurring at an affected source where the Permittee is using a continuous monitoring system (including a CPMS or COMS) to comply with the emission limitation in Subpart FFFFF, the Permittee must include the information described in Condition 7.4.10(a)(ii) and the following information (this includes periods of startup, shutdown, and malfunction):

1. The date and time that each malfunction started and stopped.

2. The date and time that each continuous monitoring was inoperative, except for zero (low-level) and high-level checks.

3. The date, time, and duration that each continuous monitoring system was out-of-control as specified in 40 CFR 63.8(c)(7), including the information in 40 CFR 63.8(c)(8).

4. The date and time that each deviation started and stopped, and whether each deviation occurred during a period of startup, shutdown, or malfunction or during another period.

5. A summary of the total duration of the deviation during the reporting period and the total duration as a percent of the total source operating time during that reporting period.

6. A breakdown of the total duration of the deviations during the reporting period including those that are due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

7. A summary of the total duration of continuous monitoring system downtime during the reporting period and the total duration of continuous monitoring system downtime as a percent of the total source operating time during the reporting period.

8. A brief description of the Blast Furnace processes.

9. A brief description of the continuous monitoring system.

10. The date of the latest continuous monitoring system certification or audit.

11. A description of any changes in continuous monitoring systems, processes, or controls since the last reporting period.

iii. Immediate startup, shutdown, and malfunction report. If the Permittee had a startup, shutdown, or malfunction during the semiannual reporting period that was not consistent with the source’s startup, shutdown, and malfunction plan, the Permittee shall submit an immediate startup, shutdown, and malfunction report according to the requirements in 40 CFR 63.10(d)(5)(ii).

b. Reporting requirements for malfunctions and breakdowns (Permits #72080034, #72080036 and #95010001):

The Permittee shall notify the Illinois EPA’s regional office by telephone as soon as possible during normal working hours, but no later than the next Agency business day, upon the occurrence of excess emissions due to malfunctions or breakdowns. The Permittee shall submit a quarterly report to the Illinois EPA’s regional office in Collinsville providing an explanation of the occurrence of such events.

c. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations by the affected blast furnace processes from applicable requirements unless a NESHAP standard specifies a different timeframe, as follows:

A. Requirements in Condition 7.4.3(b) through (f).

B. Requirements in Condition 7.4.5-1.

C. Requirements in Condition 7.4.5-3.

D. Requirements in Condition 7.4.5-4.

E. Requirements in Condition 7.4.6(a) through (j).

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

iii. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

iv. All required deviation reports described in Condition 7.4.10(c) above shall contain the following information:

A. Date, time and duration of the deviation;

B. Description of deviation;

C. Probable cause of the deviation;

D. Any corrective action or preventative measures taken;

d. Reporting on the State startup authorization shall be performed in accordance with Condition 5.10.5-1.

e. Reporting on the Federal SSM authorization shall be performed in accordance with Condition 5.10.5-3.

7.4.11 Operational Flexibility

Backdrafting the blast furnaces in order to conduct planned/routine maintenance (not associated with malfunction and breakdowns) shall follow procedures designed to minimize the release of emissions during such activities.

7.4.12 Compliance Procedures

a. For affected blast furnace processes, compliance with the applicable standards of Condition 7.4.3 is addressed by the work practices, testing, monitoring, recordkeeping and reporting requirements in Section 7.4 of this permit.

b. Compliance with the production/emission limits of Conditions 7.4.6 and 5.6.2 is addressed by the work practices, testing, monitoring, recordkeeping, and reporting requirements in Sections 7.4 and 5 of this permit.

7.4.13 Compliance Schedule and Current Enforcement Status

a. The Permittee shall comply with the following schedule of compliance related to SO_2 emissions from combustion of Blast Furnace Gas in various emission units at the source, as established in accordance with Consent Order No. 05-CH-750 (December 18, 2007 as amended on December 23, 2009):

Commitment	Timing
Use the correct emission factor for the Blast Furnace Gas SO_2 emissions when calculating, recording and reporting SO_2 emissions and for any other purpose under the Act.	Immediately and at all times going forward.
Work with the Illinois EPA, including providing additional information to the Agency when requested.	Within 30 days of the request.
Obtain a revised PSD Construction Permit.	Subject to Agency final issuance.

b. Submittal of Progress Reports

Quarterly Progress Reports shall be submitted beginning with the fourth quarter of 2009 and ending upon the achievement of compliance. Each quarterly report shall be submitted no later than 30 days after the end of the

corresponding calendar quarter. The Progress Report shall contain at least the following:

i. The required date for achieving commitments, and actual dates when such commitments were achieved.

ii. Any commitments accepted by the Permittee or otherwise established for the affected BOF as part of the resolution of the above referenced Consent Order, with the associated timing for each commitment.

iii. A discussion of progress in complying with commitments that is subject to future deadlines.

iv. If any commitment was not met, an explanation of why the required timeframe or commitment was not met, and any preventive or corrective measures adopted to achieve required commitment.

c. After completion of all required commitments and certification of compliance, as identified in Condition 7.4.13(a) no further Quarterly Progress Reports are required to be submitted.

Note: US Steel informed the Illinois EPA during deliberations on Consent Order 05-CH-750 of possible violations involving SO2 emissions from use of Blast Furnace Gas. The violations involved exceedances of the SO2 limit in Construction Permit 95010001 issued on July 23, 1996. The violations were addressed, working with the Office of the Illinois Attorney General, in Consent Order 05-CH-750, which was entered on December 18, 2007 in the Circuit Court for the Third Judicial Circuit, Madison County, Illinois. This Consent Order required US Steel to submit a complete and accurate application including required SO2 modeling to modify Construction Permit 95010001 by January 31, 2008. That application has been submitted by US Steel.

7.4.14 State-Only Conditions

State-only conditions are not being established.

7.5 Basic Oxygen Processes

7.5.1 Description

Reladling and Desulfurization Stations:

Molten iron from the blast furnaces is transported to the BOF by torpedo cars. The iron is then transferred to the charging ladles at the reladling station. In the desulfurization stations a combination of lime and magnesium is injected into the molten iron to remove the sulfur. The sulfur reacts with the lime and magnesium and forms a layer of slag on the surface of the iron. A collection system with a positive pressure baghouse is used to control emissions of particulate matter from these stations.

Slag Skimming:

After the molten iron is desulfurized, the ladle it is moved to this station where a mechanical arm is used to scrape slag from the surface of the iron. This slag is scraped from the iron ladles and into slag pots. A collection system with a baghouse is used to control emissions from this process.

Basic Oxygen Furnaces (BOF):

A fresh BOF charge usually begins with scrap metal. The scrap is charged into the BOF vessel. Molten iron is then charged into the vessel. A secondary hood is utilized to capture emissions during the charge. During periods of reduced molten iron availability scrap may be preheated with a natural gas fired lance to increase the temperature and reduce the amount of molten iron needed for a heat of steel. The BOF is then closed off and an oxygen lance is inserted to begin the melting and refining process. The oxygen lance openings on each BOF is equipped with steam rings. The steam rings are control measures for emissions of particulate matter from the BOF during the “oxygen blow” or refining phase when oxygen is being fed into the furnaces. The steam rings would inject steam in the area between the oxygen lance and the “lance hole” in the lid of the furnaces, acting to suppress the emissions of particulate through this area during the refining phase. In the BOF, the injected oxygen reacts exothermically with the carbon in the iron generating heat which melts the scrap and reducing the amount of carbon in the bath thus converting the iron to steel. When the refining process is completed, the molten steel is poured into a steel transfer ladle. Materials such as aluminum, silica, and manganese are added, as required, depending upon the particular steel alloy being produced. After the molten steel is tapped, the remaining slag is then dumped into a slag ladle. Emissions from these operations are captured and controlled with an electrostatic precipitator (ESP).

Ladle Preheating and Drying:

In this unit, lances combust either natural gas or coke oven gas to produce the heat needed to dry and preheat iron and steel handling ladles. The refractory linings of freshly re-bricked or repaired ladles must be completely dried and preheated before use. The drying process is necessary because any moisture left in the refractory would immediately vaporize and expand when the ladles are filled with molten iron or steel. This sudden expansion could cause the refractory lining to split which would allow the molten iron and steel to come into contact with, and damage the shell of the ladle. Emissions from this unit consist of particulate matter, sulfur dioxide, nitrogen oxides, carbon monoxide and organic materials generated by fuel combustion.

Ladle Metallurgy Furnaces (LMF) and Argon Stirring Stations:

At the LMF station and the argon stirring stations, final adjustments are made to the composition of a ladle of steel and the steel is held pending casting. At the LMF station, electricity can also be used to heat a ladle of steel if it has cooled below the range at which steel can be cast.

If the steel does not need to be reheated and at most minor adjustments are needed to its composition, the ladle of steel goes to one of the two argon stirring stations. At these stations, stirring lances are inserted into the steel and argon is pumped into the steel to maintain uniform composition and temperature. A baghouse is also used to control emissions from the operations.

Note: This narrative description is for informational purposes only and is not enforceable.

7.5.2 List of Emission Units and Air Pollution Control Equipment

Location	Basic Oxygen Process Descriptions	Date Constructed	Emission Control Equipment
Basic Oxygen Process Furnace Shop (BOPF)	Hot Metal Transfer Station	Prior to 05/1983	Reladle/ Desulfurization Baghouse
	(2) Hot Metal Desulfurization Stations		
	Slag Skimming Station	1985	Skimmer Baghouse
	Basic Oxygen Furnaces (BOF) #1 and #2 with Steam Rings	Prior to 08/1972	Electrostatic Precipitator
	Ladle Drying/Preheating (coke oven gas and natural gas modes)	Prior to 08/1972	None

Location	Basic Oxygen Process Descriptions	Date Constructed	Emission Control Equipment
	Ladle Metallurgy Furnace (LMF) Station	Prior to 1986	Baghouse #2
	Argon Stirring Stations	Around 1988	

7.5.3 Applicable Provisions

a. Pursuant to 35 IAC 212.446, emissions of particulate matter from basic oxygen processes shall be controlled as follows:

i. Charging, Refining and Tapping (BOF Operations). Particulate matter emissions from all basic oxygen furnaces (BOF) shall be collected and ducted to pollution control equipment. Emissions from basic oxygen furnace operations during the entire cycle (operations from the beginning of the charging process through the end of the tapping process) shall not exceed the allowable emission rate specified by 35 IAC 212.322. For purposes of computing the process weight rate, nongaseous material charged to the furnace and process oxygen shall be included. No material shall be included more than once [35 IAC 212.446(a)].

ii. Hot Metal Transfer, Hot Metal Desulfurization and Ladle Lancing.

Particulate matter emissions from hot metal transfers to a mixer or ladle, hot metal desulfurization operations and ladle lancing shall be collected and ducted to pollution control equipment, and emissions from the pollution control equipment shall not exceed 69 mg/dscm (0.03 gr/dscf) [35 IAC 212.446(b)(1)].

iii. For openings in the building housing the BOF, no person shall cause or allow emissions to exceed an opacity of 20 percent, as determined by averaging any 12 consecutive observations taken at 15 second intervals [35 IAC 212.446(c)].

b. Pursuant to 35 IAC 212.458, no person shall cause or allow emissions of PM_{10}, other than that of fugitive particulate matter, into the atmosphere to exceed the following limits during any one hour period:

i. 32.25 ng/J (0.075 lbs/mmBtu) of heat input from the burning of coke oven gas (at ladle dryers/preheaters) [35 IAC 212.458(b)(9)].

ii. 27.24 kg/hr (60 lbs/hr) and 0.1125 kg/Mg (0.225 lbs/T) of total steel in process whichever limit is more stringent for the total of all basic oxygen furnace operations (charging, refining and tapping, as described in 35 IAC 212.446(a)) and measured at the BOF stack [35 IAC 212.458(b)(23)].

iii. 22.9 mg/scm (0.01 gr/scf) from any process emissions unit, except as otherwise provided in 35 IAC 212.458 or in 212.443 and 212.446 [35 IAC 212.458(b)(7)].

c. Pursuant to 35 IAC 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to the requirements of 35 IAC 212.122, except as allowed by 35 IAC 212.123(b) and 212.124.

d. The Basic Oxygen Processes are subject to 40 CFR Part 63, Subpart FFFFF, Integrated Iron and Steel Manufacturing Facilities. Applicable provisions of this NESHAP are addressed below and in other conditions of this section of the permit.

e. Pursuant to 40 CFR 63.7790(a) and Table 1 to 40 CFR Part 63 Subpart FFFFF, the emissions from the Basic Oxygen Processes shall not exceed the following limits applicable to operation at existing basic oxygen process furnace (BOPF) identified in paragraphs 9 through 12 of Table 1 to Subpart FFFFF:

i. The Permittee must not cause to be discharged to the atmosphere any gases that exit from a primary emission control system for a BOPF with an open hood system at an existing BOPF shop that contain, on a flow-weighted basis, particulate matter in excess of 0.02 gr/dscf during the steel production cycle.

ii. For each hot metal transfer, slag skimming, and hot metal desulfurization operation, the Permittee must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf.

iii. For each ladle metallurgy furnace operation, the Permittee must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf.

iv. For each roof monitor on the BOPF Shop, the Permittee must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the BOPF shop or any other building housing the BOF or basic

oxygen process that exhibit opacity greater than 20 percent (3-minute average).

f. Pursuant to 40 CFR 63.7790(b)(3), for the electrostatic precipitator applied to control emissions from a BOF, the Permittee must maintain the hourly average opacity of emissions exiting the control device at or below 10 percent.

g. The basic oxygen furnaces are subject to 35 IAC 214.301, which provides that no person shall cause or allow the emission of sulfur dioxide into the atmosphere from any process emission source to exceed 2000 ppm.

7.5.4 Non-Applicability of Regulations of Concern

a. Pursuant to 35 IAC 212.324(a)(3) and 212.316(f), the emission limitations of 35 IAC 212.324 and 212.316 are not applicable to the basic oxygen processes because these operations are subject to specific emission standards and limitations contained in 35 IAC Part 212 Subpart R, as addressed in Condition 7.5.3(a).

b. Except where noted, 35 IAC 212.321 and 35 IAC 212.322 shall not apply to the steel manufacturing processes subject to 35 IAC 212.442 through 35 IAC 212.452 [35 IAC 212.441].

c. This permit is issued based on the affected basic oxygen processes not being subject to the applicable requirements of 35 IAC 219.301 because these processes do not emit photochemically reactive organic material as defined in 35 IAC 211.4690.

d. The basic oxygen processes are not subject to 35 IAC 216.121 because they are not fuel combustion emission units as defined in 35 IAC 211.2470.

7.5.5-1 Work Practices Provisions for Operation and Maintenance Plan (40 CFR 63.7800)

a. Pursuant to 40 CFR 63.6(e)(1)(i), the Permittee must always operate and maintain the basic oxygen processes, including air pollution control and monitoring equipment, in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by 40 CFR 63 Subpart FFFFF.

b. The Permittee shall prepare and operate at all times according to a written operation and maintenance plan for each capture system or control device subject to an operating limit in 40 CFR 63.7790(b). Each plan shall address the following elements:

i. Monthly inspections of the equipment that is important to the performance of the total capture system (*e.g.*, pressure sensors, dampers, and damper switches). This inspection shall include observations of the physical appearance of the equipment (*e.g.*, presence of holes in ductwork or hoods, flow constrictions caused by dents or accumulated dust in the ductwork, and fan erosion). The operation and maintenance plan also must include requirements to repair any defect or deficiency in the capture system before the next scheduled inspection.

ii. Preventative maintenance for each control device, including a preventative maintenance schedule that is consistent with the manufacturer’s instructions for routine and long-term maintenance.

iii. Corrective action procedures for baghouses equipped with bag leak detection systems. In the event a bag leak detection system alarm is triggered, the Permittee shall initiate corrective action to determine the cause of the alarm within 1 hour of the alarm, initiate corrective action to correct the cause of the problem within 24 hours of the alarm, and complete the corrective action as soon as practicable. Corrective actions may include, but are not limited to:

A. Inspecting the baghouse for air leaks, torn or broken bags or filter media, or any other condition that may cause an increase in emissions.

B. Sealing off defective bags or filter media.

C. Replacing defective bags or filter media or otherwise repairing the control device.

D. Sealing off a defective baghouse compartment.

E. Cleaning the bag leak detection system probe, or otherwise repair the bag leak detection system.

F. Shutting down the process producing the particulate emissions.

iv. Corrective action procedures for electrostatic precipitator (ESP) equipped with COMS. In the event an ESP exceeds the operating limit in 40 CFR 63.7790(b)(3), the Permittee shall take corrective

actions consistent with the site-specific monitoring plan in accordance with 40 CFR 63.7831(a).

7.5.5-2 Work Practices Provisions for Startup, Shutdown and Malfunction Plans and associated procedures

a. NESHAP Provisions

i. Pursuant to 40 CFR 63.7810, the Permittee must be in compliance with the emission limitations and operation and maintenance requirements in 40 CFR 63 Subpart FFFFF at all times, except during periods of startup, shutdown and malfunction as defined in 40 CFR 63.2

ii. Pursuant to 40 CFR 63.7810(c), the Permittee shall develop a written startup, shutdown, and malfunction plan for BOF according to the provisions of 40 CFR 63.6(e)(3).

iii. Pursuant to 40 CFR 63.7835:

A. Consistent with 40 CFR 63.6(e) and 63.7(e)(1), deviations from NESHAP requirements that occur during a period of startup, shutdown, or malfunction are not violations if the Permittee demonstrates to the Illinois EPA that the Permittee was operating in accordance with 40 CFR 63.6(e)(1).

B. The Illinois EPA will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in 40 CFR 63.6(e).

iv. The Permittee shall fulfill the applicable reporting requirements identified in Condition 5.10.5(b) and 40 CFR 63.7841(b)(4) and (c).

v. The Permittee shall keep records in accordance with 40 CFR 63.7842(a)(2) related to startup, shutdown and malfunction.

b. Provisions of State Emission Standards, pursuant to 35 IAC 201.149 and Part 201 Subpart I

i. Subject to the following terms and conditions, the Permittee is authorized to continue to operate in violation of the applicable standards as specified below in the event of a malfunction or breakdown.

A. For the basic oxygen furnace, the applicable state standards in Condition 7.5.3(a)(iii), (b)(ii) and (c)), and

B. For the LMF, the applicable state standards in Conditions 7.5.3(b)(iii) and (c).

Note: This authorization is provided because the Permittee applied for such authorization in its CAAPP application, generally explaining why such continued operation would be required to prevent injury to personnel or severe damage to equipment, and describing the measures that will be taken to minimize emissions from any malfunctions and breakdowns.

ii. This authorization only allows such continued operation as necessary to prevent injury to personnel or severe damage to equipment and does not extend to continued operation solely for the economic benefit of the Permittee.

iv. Upon occurrence of excess emissions due to malfunction or breakdown, the Permittee shall, as soon as practicable, repair the units and/or re-establish applicable control practices.

v. The Permittee shall fulfill the applicable recordkeeping requirements of Condition 7.5.9(g) and reporting requirements of Condition 5.10.5-2.

vi. Following notification to the Illinois EPA (see Condition 5.10.5-2(a)(i)) of a malfunction or breakdown with excess emissions, the Permittee shall comply with all reasonable directives of the Illinois EPA with respect to such incident.

vii. This authorization does not relieve the Permittee from the continuing obligation to minimize excess emissions during malfunction or breakdown. As provided by 35 IAC 201.265, an authorization in a permit for continued operation with excess emissions during malfunction and breakdown does not shield the Permittee from enforcement for any such violation and only constitutes a prima facie defense to such an enforcement action provided that the Permittee has fully complied with all terms and conditions connected with such authorization.

7.5.5-3 Work Practices from Permits 72080043, 95010001 and 10080021

a. Pursuant to Permit 72080043 [T1]:

i. Overlapping operations of the BOF vessels is allowed under the following conditions:

A. The hot metal charge of the second vessel shall be initiated and completed during the time between completion of the blow and start of tap on the first vessel while sufficient draft at the ESP capture system is established and maintained for both vessels.

B. The charge and/or blow on one vessel shall not begin until sufficient draft has been established at the associated ESP capture system (a.k.a., doghouse) and the alloy addition at the vessel tapping has been completed for at least 1 minute.

C. Sufficient draft at the ESP capture system of the vessel being tapped shall be maintained for at least 1 minute after alloy addition has been completed. After such period, the capture system draft may be transferred over to the other vessel in order to satisfy Condition (A) above.

D. Only overlapping of the hot metal charge of the second vessel after the end of blow and prior to onset of tap of the first vessel and overlapping of tapping of the first vessel, after alloy addition, and the hot metal charge and/or blow on the second vessel are allowed.

E. Condition (B) and (C) above shall be part of the Standard Operating Procedure (SOP) of the BOF vessels.

ii. Each BOF vessel shall be equipped with a Fume Suppression System which shall be in use at all times that tapping is occurring during overlapping operations.

b. Pursuant to Permit 95010001 [T1]:

i. The BOF capture system shall be operated at the above minimum set points (see Condition 7.5.6(h)) until and unless the Illinois EPA approves a lower minimum set point based on a demonstration that a better level of particulate matter control will occur, except for purposes of emissions testing as related to the set point [T1].

ii. The Permittee shall operate, maintain, and repair the BOF ESP in a manner that assures compliance with the conditions of Permit 95010001 [T1].

iii. The Permittee shall maintain an adequate inventory of spare parts for the BOF ESP at all times [T1].

c. Pursuant to Permit 10080021 [T1]:

i. Beginning October 31, 2012, during the refining phase of operation, the steam rings on the BOFs shall be operated in accordance with written procedures developed by the Permittee that set forth the timing and rate of steam injection as related to furnace operation and reflect good air pollution control practice to minimize emissions of particulate matter.

ii. Prior to October 31, 2012, during the refining phase of operation, the steam rings on the BOFs shall be operated in accordance with good air pollution control practice to minimize emissions of particulate matter.

7.5.6 Production and Emission Limitations from Permit 95010001

a. Total combined production of liquid steel from the affected BOFs shall not exceed 11,000 net tons per day, averaged over any calendar month [T1].

b. BOF Shop Emissions (tons/yr total) shall not exceed the following limits [T1]:

PM	PM_{10}	NO_x	VOM	CO	Lead
510	451	70	12	16,097	1.43

c. BOF ESP Stack (charge, refine, tap) emissions shall not exceed the following limits [T1]:

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.16	262.80
PM_{10}	0.16	262.80
NO_x	0.0389	69.63
VOM	0.0060	10.74
CO	8.993	16,097.47
Lead	0.1934 lbs/hr	1.26

d. BOF Roof Monitor emissions shall not exceed the following limits [T1]:

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.0987	176.71
PM_{10}	0.06614	118.40
Lead	0.0129 lbs/hr	0.08

e. Hot Metal Desulfurization and Hot Metal Transfer emissions shall not exceed the following limits [T1]:

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.03721	58.88
PM_{10}	0.03721	58.88
VOM	0.0010	1.58
Lead	0.0133 lbs/hr	0.09

f. Hot metal charging and ladle slag skimming emissions shall not exceed the following limits [T1]:

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.0050	7.94
PM_{10}	0.0050	7.94

g. Emissions from Argon Stirring Station and Material Handling Tripper (Ladle Metallurgy Baghouse #2) shall not exceed the following limits (see Section 7.1):

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.00715	12.80
PM_{10}	0.00715	12.80

h. The stack gas pulpit set point of the BOF ESP control system shall be set in accordance with the following, so as to establish sufficient particulate matter capture efficiency of the charging and primary hoods [T1]:

i. Set point requirements while only a single BOF vessel is in operation:

A. Minimum set point during charging operation: 550,000 cfm;

B. Minimum set point during refining operation: 650,000 cfm; and

C. Minimum set point during tapping operation: 200,000 cfm (until one minute after completing alloy addition).

ii. During dual operation of BOF vessels (a.k.a., overlapping BOF operation) the minimum set point shall be 700,000 cfm.

i. Compliance with the annual limits shall be determined on a calendar year basis [T1].

Note: These provisions (Conditions 7.5.6(a) through (i)) were originally established in Construction Permit 95010001.

j. Emissions of particulate matter from the Ladle metallurgy station and the existing argon stirring station shall not exceed 16.20 TPY [T1].

k. The maximum process weight for 1) argon stirring, 2) ladle reheat, 3) alloy addition, 4) ladle slag skimming, and 5) hot metal desulfurization shall not exceed 356.7 t/hr for 8,760 hours per year [T1].

Note: These provisions (Conditions 7.5.6(j) and (k)) were originally established in Permit 83050042.

7.5.7 Testing Requirements

a. Testing requirements in 40 CFR Part 63 Subpart FFFFF:

i. Pursuant to 40 CFR 63.7821(b), for the Basic Oxygen Furnaces (which are equipped with a control device other than a baghouse), the Permittee shall conduct subsequent performance tests no less frequently than twice (at mid-term and renewal) during each term of the title V operating permit (i.e., this CAAPP permit).

ii. Pursuant to 40 CFR 63.7821(c), for each Basic Oxygen Furnace Process equipped with a baghouse, the Permittee shall conduct subsequent performance tests no less frequently than once during each term of the Title V operating permit (every 60 months).

iii. The Permittee shall use the following test methods for compliance demonstration with the emission limits for particulate matter [40 CFR 63.7822(b)]:

A. The Permittee shall determine the concentration of particulate matter according to the following test methods in Appendix A to 40 CFR Part 60.

1. Method 1 to select sampling port locations and the number of traverse points. Sampling ports must be located at the outlet of the control device and prior to any releases to the atmosphere.

2. Method 2, 2F, or 2G to determine the volumetric flow rate of the stack gas.

3. Method 3, 3A, or 3B to determine the dry molecular weight of the stack gas.

4. Method 4 to determine the moisture content of the stack gas.

5. Method 5, 5D, or 17, as applicable, to determine the concentration of particulate matter (front half filterable catch only).

B. The Permittee shall collect a minimum sample volume of 60 dry standard cubic feet (dscf) of gas during each particulate matter test run. Three valid test runs are needed to comprise a performance test.

iv. Pursuant to 40 CFR 63.7822(g), for the BOF ESP (which is a primary emission control system applied to emissions from a BOF with an open hood system), the Permittee shall complete the following requirements:

A. Sample only during the steel production cycle. The Permittee shall conduct sampling under conditions that are representative of normal operation. The Permittee shall record the start and end time of each steel production cycle and each period of abnormal operation; and

B. Sample for an integral number of steel production cycles. The steel production cycle begins when the scrap is charged to the BOF and ends 3 minutes after the slag is emptied from the vessel into the slag pot.

v. Pursuant to 40 CFR 63.7822(h), for a control device applied to emissions from BOPF shop ancillary operations (hot metal transfer, slag skimming, hot metal desulfurization, or ladle metallurgy), the Permittee shall sample only when the operation(s) is being conducted.

vi. The Permittee shall conduct each visible emissions performance test such that the opacity observations overlap with the performance test for particulate matter [40 CFR 63.7823(b)].

vii. The following test methods shall be used for opacity observations pursuant to 40 CFR 63.7823(d):

Using a certified observer, the Permittee shall determine the opacity of emissions according to Method 9 in Appendix A to Part 60 as specified below:

A. Instead of procedures in section 2.4 of Method 9 in Appendix A to 40 CFR Part 60, the Permittee shall record observations to the nearest 5 percent at 15-second intervals for at least three steel production cycles.

B. Instead of procedures in section 2.5 of Method 9 in Appendix A to 40 CFR Part 60, the Permittee shall determine the 3-minute block average opacity from the average of 12 consecutive observations recorded at 15-second intervals.

b. Pursuant to Sections 39.5(7)(d) and (p) of the Act, in conjunction with the testing of emissions required for an emission unit in the BOF shop by the NESHAP (Condition 7.5.7(a) which requires testing at the midterm and renewal of this CAAPP permit), the Permittee shall also have testing conducted to measure emissions of other pollutants as follows.

i. Testing shall be conducted for PM/PM_{10}*, lead and other pollutants as follow: BOF Furnaces (ESP) – NO_x, VOM and CO; and Hot Metal Desulfurization and Slag Skimming (Baghouses) – VOM.

* As an alternative to measurements for PM_{10} emissions, the measured results for PM, as determined in accordance with the NESHAP, shall be considered PM10, as provided for by 35 IAC 212.108.

ii. The relevant test method specified by the NESHAP or the following USEPA test methods shall be used for this testing, unless another USEPA test method is approved by the Illinois EPA during the review of a Test Plan submitted by the Permittee prior to testing.

Location of Sample Points	Method 1
Gas Flow and Velocity	Method 2
Flue Gas Weight	Method 3
Moisture	Method 4
VOM	Method 18 or 25A
NO_x	Method 7E or 19
CO	Method 10 or 10B
Lead	Method 29

iii. For this emission testing, test notifications and reporting shall be done by the Permittee in accordance with Condition 8.6.2 and 8.6.3 of this permit.

c. As provided by 35 IAC 212.446(c), observations to determine compliance with the opacity standard in 35 IAC 212.446(c) (see Condition 7.5.3(a)(iii)) shall be performed in accordance with 40 CFR Part 60, Appendix A, Method 9, incorporated by reference in 35 IAC 212.113, except that compliance shall be determined by averaging any 12 consecutive observations taken at 15 second intervals.

7.5.8 Monitoring and Inspection Requirements

a. Monitoring (40 CFR 63.7830)

i. For the capture system for secondary emissions from the Basic Oxygen Furnaces (which are subject to an operating limit in 40 CFR 63.7790(b)(1) established in Permittee's capture system operation and maintenance plan), the Permittee shall install, operate, and maintain a continuous parameter monitoring system (CPMS) according to the requirements in 40 CFR 63.7831(e) and the requirements in 40 CFR 63.7830(a)(1) through (3).

ii. The Permittee shall operate and maintain a bag leak detection system on Baghouse #2 and the slag skimmer baghouse according to 40 CFR 63.7831(f) and monitor the relative change in particulate matter loadings according to the requirements in 40 CFR 63.7832.

iii. The Permittee shall conduct inspections of each baghouse at the specified frequencies according to the following requirements [40 CFR 63.7830(b)(4)]:

A. Monitor the pressure drop across each baghouse cell each day to ensure pressure drop is within the normal operating range identified in the operation and maintenance manual.

B. Confirm that dust is being removed from hoppers through weekly visual inspections or other means of ensuring the proper functioning of removal mechanisms.

C. Check the compressed air supply for pulse-jet baghouses each day.

D. Monitor cleaning cycles to ensure proper operation using an appropriate methodology.

E. Check bag cleaning mechanisms for proper functioning through monthly visual inspections or equivalent means.

F. Make monthly visual checks of bag tension on reverse air and shaker-type baghouses to ensure that bags are not kinked (kneed or bent) or laying on their sides. The Permittee does not have to make this check for shaker-type baghouses using self-tensioning (spring-loaded) devices.

G. Confirm the physical integrity of the baghouse through quarterly visual inspections of the baghouse interior for air leaks.

H. Inspect fans for wear, material buildup, and corrosion through quarterly visual inspections, vibration detectors, or equivalent means.

iv. For the ESP controlling the BOF furnaces (which are subject to an opacity limit of 10 percent, hourly average, pursuant to 40 CFR 63.7790(b)(3)), the Permittee shall operate and maintain a continuous opacity monitoring system (COMS) according to the requirements in 40 CFR 63.7831(h) and monitor the hourly average opacity of emissions exiting the stack according to the requirements in 40 CFR 63.7832 [40 CFR 63.7830(d)].

If the hourly average opacity for the ESP exceeds the operating limit, the Permittee shall follow the following procedures [40 CFR 63.7833(g)]:

A. The Permittee shall initiate corrective action to determine the cause of the exceedance within 1 hour. During any period of corrective action, the Permittee must continue to monitor and record all required operating parameters for equipment that remains in operation. Within 24 hours of the exceedance, the Permittee shall measure and record the hourly average operating parameter value for the emission unit on which corrective action was taken. If the hourly average parameter value meets the applicable operating limit, then the corrective action was successful and the emission unit is in compliance with the applicable operating limit.

B. If the required initial corrective action was not successful, the Permittee shall complete additional corrective action within the next 24 hours (48 hours from the time of the exceedance). During any period of corrective action, the Permittee shall continue to monitor

and record all required operating parameters for equipment that remains in operation. After this second 24-hour period, the Permittee shall again measure and record the hourly average operating parameter value for the emission unit on which corrective action was taken. If the hourly average parameter value meets the applicable operating limit, then the corrective action was successful and the emission unit is in compliance with the applicable operating limit.

C. For purposes of 40 CFR 63.7833(g)(1) and (2), in the case of an exceedance of the hourly average opacity operating limit for an ESP, measurements of the hourly average opacity based on visible emission observations in accordance with Method 9 may be taken to evaluate the effectiveness of corrective action.

D. If the second attempt at corrective action required in paragraph 40 CFR 63.7833 (g)(2) was not successful, the Permittee shall report the exceedance as a deviation in the next semiannual compliance report according to 40 CFR 63.7841(b).

b. Installation, operation, and maintenance requirements for monitors [40 CFR 63.7831]

i. For the slag skimmer baghouse and Baghouse #2 (which are subject to 40 CFR 63.7830(b)(1)), the Permittee shall operate and maintain the bag leak detection system according to the following requirements [40 CFR 63.7831(f)]:

A. The system must be certified by the manufacturer to be capable of detecting emissions of particulate matter at concentrations of 10 milligrams per actual cubic meter (0.0044 grains per actual cubic foot) or less.

B. The system must provide output of relative changes in particulate matter loadings.

C. The system must be equipped with an alarm that will sound when an increase in relative particulate loadings is detected over a preset level. The alarm must be located such that it

can be heard by the appropriate plant personnel.

D. Each system that works based on the triboelectric effect must be installed, operated, and maintained in a manner consistent with the guidance document, “Fabric Filter Bag Leak Detection Guidance,” EPA-454/R-98-015, September 1997. The Permittee may install, operate, and maintain other types of bag leak detection systems in a manner consistent with the manufacturer’s written specifications and recommendations.

E. To make the initial adjustment of the system, the Permittee shall establish the baseline output by adjusting the sensitivity (range) and the averaging period of the device. Then, the Permittee shall establish the alarm set points and the alarm delay time.

F. Following the initial adjustment, the Permittee may not adjust the sensitivity or range, averaging period, alarm set points, or alarm delay time, except as detailed in the Permittee’s operation and maintenance plan. The Permittee may not increase the sensitivity by more than 100 percent or decrease the sensitivity by more than 50 percent over a 365-day period unless a responsible official certifies, in writing, that the baghouse has been inspected and found to be in good operating condition.

G. Where multiple detectors are required, the system’s instrumentation and alarm may be shared among detectors.

ii. For the ESP (which is subject to the opacity limit in 40 CFR 63.7790(b)(3)), the Permittee shall install, operate, and maintain a COMS according to the following requirements in 40 CFR 63.7831 (h)(1) through (4):

A. The Permittee shall install, operate, and maintain each COMS according to Performance Specification 1 in 40 CFR Part 60, Appendix B.

B. The Permittee shall conduct a performance evaluation of each COMS according to 40 CFR 63.8 and Performance Specification 1 in Appendix B to 40 CFR Part 60.

C. Each COMS must complete a minimum of one cycle of sampling and analyzing for each successive 10-second period and one cycle of data recording for each successive 6-minute period.

D. COMS data must be reduced to 6-minute averages as specified in 40 CFR 63.8(g)(2) and to hourly averages where required by 40 CFR 63 Subpart FFFFF.

c. Pursuant to the operation and maintenance requirements of the O/M plan required by 40 CFR 63.7800(b), the Permittee shall comply with following inspection procedures for the capture systems and controls:

Monthly inspections of the equipment that is important to the performance of the total capture system. This inspection must include observations of the physical appearance of the equipment (e.g., presence of holes in ductwork or hoods, flow constrictions caused by dents or accumulated dust in the ductwork, and fan erosion). Repair of any defect or deficiency in the capture system shall be done before the next scheduled inspection.

d. Monitoring of capture and control systems for Basic Oxygen Furnaces (from Permit 95010001):

i. The Permittee shall operate and maintain the waste gas suction monitor system for the capture system for the Basic Oxygen Furnace that continually measures and records each operation (i.e., for each charge, each refine, each tap) of each steel production cycle the static pressure in the main downcommer duct of the ESP emissions capture and transport system.

A. The Permittee shall use the waste gas suction monitoring system as a mechanism to ensure sufficient draft is maintained in the emissions capture hoods and transport ducts so as to maximize emissions capture and transport and minimize uncaptured emissions and emission leaks.

B. The Permittee shall operate and maintain the system to ensure that accurate and useful data is collected.

C. The Permittee shall continuously record the static pressure in the main down comer duct of the ESP emissions capture and transport system.

ii. The Permittee shall calibrate, operate, and maintain a continuous strip chart recorder or disk storage of the ESP stack gas flow rate as measured by the stack gas flow meter during ESP use.

iii. The stack gas flow meter shall be calibrated on at least a quarterly basis.

iv. A. The Permittee shall visually inspect at least monthly all visible BOF vessel enclosures, hooding and ducts used to capture and transport emissions for the BOF ESP control system.

B. A log shall be maintained of these inspections which includes observations of the physical appearance of the capture system and any noted deficiencies (e.g., the presence of any holes in ductwork or hoods, flow constrictions caused by dents or accumulated dust in ductwork, and fan erosion).

C. Any leaks or areas otherwise noted to be in need of repair, shall be repaired expeditiously.

e. Opacity observations for 35 IAC 212.446(c);

The following opacity observations shall be performed pursuant to Section 39.5(7)(a) and (p) of the Act:

i. The Permittee shall have the opacity of the exhaust of the building housing the BOF determined by a qualified observer in accordance with USEPA Method 9 while the affected BOF(s) is operating, as further specified below.

A. Observations of opacity shall be conducted on the following frequency unless absence of adequate daylight or weather conditions preclude scheduled observation, in which case, the next observations shall be conducted on the next operating day of the BOF during which observations of opacity can reasonably be conducted in accordance with USEPA Method 9, except that reading shall be taken as a 3-minute average (12 consecutive observations taken 15 seconds intervals).

B. If a baghouse is not installed for control of tapping emissions from the BOF, these readings shall be performed for at least five days out of every seven. A day is defined as any day when a BOF is in operation for a minimum of

four hours during conditions that are acceptable for Method 9 readings. A minimum of 60 consecutive minutes of opacity readings must be obtained and must encompass at least one steel production cycle. A production cycle is defined as the beginning of scrap charging to the completion of deslagging of the steelmaking vessel. Results of these readings shall be reduced to three minute rolling averages.

C. Beginning 30 days after initial startup of a baghouse for control of tapping emissions from the BOFs, the Permittee shall have the opacity of the exhaust of the building housing the BOF determined by a qualified observer in accordance with USEPA Method 9 while the affected BOF(s) are operating, as further specified below.

1. The duration of opacity observations for each test shall be one complete steel making cycle.

2. Observations of opacity shall be conducted on the following frequency unless absence of adequate daylight or weather conditions preclude scheduled observation, in which case, the next observations shall be conducted on the next operating day of the BOF during which observations of opacity can reasonably be conducted in accordance with USEPA Method 9.

3. On a weekly basis (at least once every seven operating days of BOF) except as provided below.

4. On a daily basis (at least 5 days out of seven operating days of BOF) if any of the five previous 3-minute average observations measured opacity of 18 percent or more, continuing on a daily basis until the maximum opacities measured in five consecutive daily observations are all less than 18 percent, at which time observations on a weekly basis shall resume.

ii. Upon written request by the Illinois EPA, additional opacity observations shall be conducted within 5 operating days for the BOF from the date of the request by the Illinois EPA or on the date agreed upon by the Illinois EPA, whichever is later. For

such observations conducted pursuant to a request from the Illinois EPA:

A. The Permittee shall notify the Illinois EPA at least 24 hours in advance of the date and time of these observations, in order to enable the Illinois EPA to witness the observations. This notification shall include the name and employer of the qualified observer(s).

B. The Permittee shall promptly notify the Illinois EPA of any changes in the time or date for observations.

C. The duration of these observations shall cover a complete heat or cycle of the affected BOF.

D. The Permittee shall provide a copy of the current certification for the opacity observer and observer’s readings to the Illinois EPA at the time of the observations, if the Illinois EPA personnel are present.

E. The Permittee shall keep records for all opacity measurements for the BOF made in accordance with USEPA Method 9 for the affected operations that the Permittee conducts or that are conducted at its behest by individuals who are qualified to make such observations. For each occasion on which such measurements are made, these records shall include the formal report for the measurements, a description of the measurements that were made, the operating condition of the affected operations, the observed opacity, and copies of the raw data sheets for the measurements.

iii. A. The Permittee shall determine the opacity from the BOF ESP stack for at least one hour on any normal work day that the continuous opacity monitor on the BOF ESP stack has an outage that exceeds two consecutive hours and is still down. The readings shall commence as soon as possible after the opacity monitor has been down for two consecutive hours. If meteorological conditions or lack of visibility preclude these observations from being conducted, then this shall be noted in the log book.

B. The opacity shall be determined in accordance with the observation procedures set out in 40 CFR Part 60, Appendix A, Method 9.

f. Monitoring and Collecting Data [40 CFR 63.7832]:

i. For purposes of the NESHAP, 40 CFR 63 Subpart FFFFF, except for monitoring malfunctions, out-of-control periods as specified in 40 CFR 63.8(c)(7), associated repairs, and required quality assurance or control activities (including as applicable, calibration checks and required zero and span adjustments), the Permittee shall monitor continuously (or collect data at all required intervals) at all times a subject control/capture system is operating.

ii. The Permittee may not use data recorded during monitoring malfunctions, associated repairs, and required quality assurance or control activities in data averages and calculations used to report emission or operating levels or to fulfill a minimum data availability requirement, if applicable. The Permittee shall use all the data collected during all other periods in assessing compliance.

iii. A monitoring malfunction is any sudden, infrequent, not reasonably preventable failure of the monitoring to provide valid data. Monitoring failures that are caused in part by poor maintenance or careless operation are not malfunctions.

g. Operational Monitoring for Steam Rings from Construction Permit 10080021:

The Permittee shall install, maintain and operate a continuous monitoring system on each steam ring for the steam valve position (open or closed) and the rate at which steam is being injected.

7.5.9 Recordkeeping Requirements

The Permittee shall maintain records of the following items pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. 40 CFR 63 Subpart FFFFF (40 CFR 63.7842 and 63.7843)

i. The Permittee shall keep the following records specified in 40 CFR 63.7842 (a)(1) through (a)(3):

A. A copy of each notification and report that the Permittee submitted to comply with 40 CFR 63 Subpart FFFFF, including all documentation supporting any initial notification or notification of compliance status that the Permittee submitted, according to the requirements in 40 CFR 63.10(b)(2)(xiv).

B. The records in 40 CFR 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction.

C. Records of performance tests, performance evaluations, and opacity observations as required in 40 CFR 63.10(b)(2)(viii).

ii. For each COMS, the Permittee shall keep the following records specified in 40 CFR 63.7842 (b)(1) through (4):

A. Records described in 40 CFR 63.10(b)(2)(vi) through (xi).

B. Monitoring data for a performance evaluation as required in 40 CFR 63.6(h)(7)(i) and (ii).

C. Previous (that is, superseded) versions of the performance evaluation plan as required in 40 CFR 63.8(d)(3).

D. Records of the date and time that each deviation started and stopped, and whether the deviation occurred during a period of startup, shutdown, or malfunction or during another period.

iii. The Permittee shall keep the records specified in 40 CFR 63.6(h)(6) for visual observations.

iv. The Permittee shall keep the records required in 40 CFR 63.7833 and 63.7834 to show continuous compliance with each emission limitation and operation and maintenance requirement that applies to the Permittee.

v. The Permittee shall keep the records in a form suitable and readily available for expeditious review, according to 40 CFR 63.10(b)(1).

vi. As specified in 40 CFR 63.10(b)(1), the Permittee shall keep each record for 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record.

vii. The Permittee shall keep each record on site for at least 2 years after the date of each occurrence, measurement, maintenance, corrective action, report, or record, according to 40 CFR 63.10(b)(1). The

Permittee may keep the records offsite for the remaining 3 years.

viii. The Permittee shall maintain a current copy of the operation and maintenance plan required in 40 CFR 63.7800(b) onsite and available for inspection upon request.

ix. A. The Permittee shall maintain a copy of the site-specific monitoring plan for each CPMS required by 40 CFR 63.7830, pursuant to 40 CFR 63.7831(a).

B. If the Permittee operates under manufacturer's specifications or manufacturer's instructions, such manufacturer's documentation shall be kept at the source as part of the required records.

b. Recordkeeping from Permits 72080043 and 95010001:

i. Operating time of the BOFs;

ii. Operating time of the capture systems and performance parameters, including air flow and fan amperage through the fan motors, gas temperature at inlet to ESP, damper settings, and steam injection rate;

iii. Operating time of the ESP and performance parameters, including voltage and amperage of each transformer/rectifier set, number of sections in use;

iv. All routine and nonroutine maintenance performed, including dates and duration of outages, inspection schedule and findings, leaks detected, repair actions, and replacements;

v. Total production of molten steel at the BOFs (daily, monthly, and annual production in tons);

vi. The Permittee shall keep a continuous strip chart recorder or disk storage of the stack gas flow rate during ESP use.

vii. The Permittee shall records for each steel production cycle the various stack gas flow rates for each process (i.e., for each charge, each refine, each tap) of each steel production cycle. That is, the Permittee shall be able to distinguish the measured flow rate of stack gas during each production cycle.

ix. Records of all opacity observations.

c. Recordkeeping carried over from Permit 08110016:

The operating and maintenance records that the Permittee maintains for the ESP shall include the following information for the induced draft fans on the ESP, in addition to other required information:

i. The periods of time when the BOFs operated with less than three properly functioning fans, with description and explanation.

ii. The periods of time when the BOFs are operating and a spare fan is not available, with the identity of the fan(s) that were not available and explanation, e.g., spare fan not available due to regularly scheduled maintenance or spare fan not available due to unplanned breakdown of the main bearings.

d. Recordkeeping for the steam rings on the BOF furnaces from Construction Permit 10080021:

i. A. The Permittee shall maintain a record of the steam valve position (open or closed) and the rate at which steam is being injected, as determined by the continuous monitoring systems required by Condition 7.5.8(g).

B. In addition to keeping records of the data measured by these monitoring systems, the Permittee shall keep records of the operation, calibration and maintenance of these systems.

ii. The Permittee shall maintain an operating log or other records for the BOF and steam rings that contain information generally documenting the steam rings are being operated in accordance with Condition 7.5.5-3(c), including information for the timing of the refining phase of each heat of a BOF furnace.

iii. The Permittee shall maintain detailed records of the following information for each heat in a BOF furnace in which the steam ring was not operated during the refining phase:

A. Identification of the heat and the duration of the incident, i.e., start time and time normal operation was achieved or the refining phase was completed.

B. Description of the incident, impact on effectiveness of the steam ring, probable cause, and corrective actions.

C. Verification that the established procedures were followed or a description and explanation why procedures were not followed.

Note: These records may be kept with other logs or records that the Permittee keeps for the BOF furnaces and their instrumentation and need not be kept as a separate record.

e. The Permittee shall keep annual records (tons/year) of steel processed at the slag skimming station, the argon stirring station and ladle metallurgy furnace station.

f. Emission Records

The Permittee shall keep the following records related to the emissions of the affected basic oxygen processes to verify compliance with the applicable limits in Conditions 7.5.6(b) through (g):

i. A file containing the emission factors used by the Permittee to determine emissions of different pollutants from such processes, with supporting documentation. These records shall be reviewed and updated by the Permittee as necessary to assure that the emission factors that it uses to determine emissions of the affected processes do not understate actual emissions, including review when emission testing is conducted for an affected process. These records shall be prepared and copies sent to the Illinois EPA in accordance with Condition 5.9.6(c), except that copies of the initial records shall be submitted to the Illinois EPA no later than August 3, 2012.

ii. Records for any periods of operation of an affected process that are not otherwise addressed in the required records during which the established emission factor in Condition 7.5.9(f)(i) would understate actual emissions of the process, with description of the period of operation and an estimate of the additional emissions during such period that are not accounted for by the established factor, with supporting explanation and calculations.

iii. Records for the annual emissions of such processes for comparison to the limits in Conditions 7.5.6(c) through (g), with supporting calculations.

iv. Records for combined annual emissions of such affected processes, based on the summation of the above data, for comparison to the limits in Condition 7.5.6(b).

g. In the operational logs or other records for the operation of the affected basic oxygen processes, the Permittee shall keep records identifying process upsets that result in the generation of additional opacity or PM emissions, such as loss of the slag cover on the molten metal in a vessel or a spill of molten metal. For these upsets, these records shall include the time of the upset, a description of the upset, and a discussion of the consequences for PM emissions from the affected basic oxygen processes.

h. Records for Malfunctions or Breakdowns

Pursuant to 35 IAC 201.263, the Permittee shall maintain records of continued operation of the affected Basic Oxygen Furnace and Ladle Metallurgy Furnace as addressed by Condition 7.5.5-2(b), during malfunctions or breakdowns, which at a minimum, shall include the following records. The preparation of these records shall be completed within 45 days of an incident, unless the Permittee conducts a root cause analysis for the incident, in which case the preparation of these records, other than the root cause analysis, shall be completed within 120 days of the incident.

i. Date, time and duration of the incident.

ii. A detailed description of the incident, including:

A. A chronology of significant events during and leading up to the incident.

B. Relevant operating data for the unit, including information such as operator log entries and directives provided by management during the incident.

C. The measures taken to reduce the quantity of emissions and the duration of the incident including the resources utilized to address the incident.

D. The magnitude of emissions during the incident.

iii. An explanation why continued operation of an affected basic oxygen furnace was necessary to prevent personnel injury or prevent equipment damage.

iv. A discussion of the cause(s) or probable cause(s) of the incident including the following,

A. Whether the incident was sudden, unavoidable, or preventable, including:

1. Why the equipment design did not prevent the incident;

2. Why better maintenance could not have avoided the incident;

3. Why better operating practices could not have avoided the incident; and

4. Why there was no advance indication for the incident.

B. Whether the incident stemmed from any activity or event that could have been foreseen, avoided or planned for.

C. Whether the incident was or is part of a recurring pattern indicative of inadequate design, operation or maintenance.

v. A description of any steps taken or to be taken to prevent similar future incidents or reduce their frequency and severity.

vi. As an alternative to keeping the records required by Condition 7.5.9(g)(iv), the Permittee may perform a root cause analysis. For this purpose, a root cause analysis is an analysis whose purpose is to determine, correct and eliminate the primary causes of the incident and the excess emissions resulting there from. If the Permittee performs a root cause analysis method that would define the problem, define all causal relationships, provide a causal path to the root cause, delineate the evidence, and provide solutions to prevent a recurrence. Such an analysis shall be completed within one year of the incident.

7.5.10 Reporting Requirements

a. 40 CFR Part 63, Subpart FFFFF (40 CFR 63.7841)

i. Compliance report due dates. Unless the Administrator has approved a different schedule, the Permittee shall submit a semiannual compliance report to the permitting authority according to the following requirements:

A. Semi-annual compliance report must cover the semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

B. Each compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date comes first after the end of the semiannual reporting period.

ii. Compliance report contents. Each compliance report shall include the following information:

A. Company name and address.

B. Statement by a responsible official, with that official’s name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

C. Date of report and beginning and ending dates of the reporting period.

D. If the Permittee had a startup, shutdown, or malfunction during the reporting period and the Permittee took actions consistent with the source’s startup, shutdown, and malfunction plan, the compliance report must include the information in 40 CFR 63.10(d)(5)(i).

E. If there were no deviations from the continuous compliance requirements in 40 CFR 63.7833 and 63.7834 that apply to the Permittee, a statement that there were no deviations from the emission limitations or operation and maintenance requirements during the reporting period.

F. If there were no periods during which a continuous monitoring system (including a CPMS, COMS, or continuous emission monitoring system (CEMS)) was out-of-control as specified in 40 CFR 63.8(c)(7), a statement that there were no periods during which the CPMS was out-of-control during the reporting period.

G. For each deviation from an emission limitation in 40 CFR 63.7790 that occurs at each Basic Oxygen Process where the Permittee is not using a continuous monitoring system (including a CPMS, COMS, or CEMS) to comply with an emission limitation in 40 CFR Subpart FFFFF, the compliance report must contain the information described in Condition 7.5.10(a)(ii)(A) through (F) and the following information (this includes periods of startup, shutdown, and malfunction):

1. The total operating time of each Basic Oxygen Process during the reporting period.

2. Information on the number, duration, and cause of deviations (including unknown cause, if applicable) as applicable and the corrective action taken.

H. For each deviation from an emission limitation occurring at each Basic Oxygen Furnace Process where the Permittee is using a continuous monitoring system (including a CPMS or COMS) to comply with the emission limitation in 40 CFR 63 Subpart FFFFF, the Permittee shall include the following information (this includes periods of startup, shutdown, and malfunction):

1. The date and time that each malfunction started and stopped.

2. The date and time that each continuous monitoring was inoperative, except for zero (low-level) and high-level checks.

3. The date, time, and duration that each continuous monitoring system was out-of-control as specified in 40 CFR 63.8(c)(7), including the information in 40 CFR 63.8(c)(8).

4. The date and time that each deviation started and stopped, and whether each deviation occurred during a period of startup, shutdown, or malfunction or during another period.

5. A summary of the total duration of the deviation during the reporting period and the total duration as a percent of the total source operating time during that reporting period.

6. A breakdown of the total duration of the deviations during the reporting period including those that are due to startup, shutdown, control equipment problems, process problems, other known causes, and other unknown causes.

7. A summary of the total duration of continuous monitoring system downtime during the reporting period and the total duration of continuous monitoring system downtime as a percent of the total source

operating time during the reporting period.

8. A brief description of the Basic Oxygen Processes.

9. A brief description of the continuous monitoring system.

10. The date of the latest continuous monitoring system certification or audit.

11. A description of any changes in continuous monitoring systems, processes, or controls since the last reporting period.

iii. Immediate startup, shutdown, and malfunction report. If the Permittee had a startup, shutdown, or malfunction during the semiannual reporting period that was not consistent with the source's startup, shutdown, and malfunction plan, the Permittee shall submit an immediate startup, shutdown, and malfunction report according to the requirements in 40 CFR 63.10(d)(5)(ii).

b. Monthly Opacity Exceedance Report.

Monthly opacity exceedance reports for the BOF ESP shall be sent to the Illinois EPA Regional Office. These reports shall contain all opacity measurements which exceed 30 percent, averaged over a six minute period. These "excess opacity" reports shall provide, for each such incident, the percent opacity measured as well as the date and span of such incident. These reports shall state the reasons for the excess opacity. The reports shall also specify the dates of those periods during which the continuous monitoring system was not in operation [Section 39.5(7)(f)(ii) of the Act].

c. Reporting Requirements from Permit 08110016:

After the initial year of operation (12 calendar months) of the BOF with an ESP with four fans, the Permittee shall submit a report to the Illinois EPA that evaluates the impacts of the addition of a fourth fan to the ESP on the particulate matter emissions of the BOF. This report shall, at a minimum, include the following information and address impacts on both stack emissions of particulate matter (i.e., emissions from the ESP stack) and uncaptured emissions of particulate matter (e.g., emissions from the roof monitor of the BOPF Shop). This report shall be

submitted by the end of the third month following the initial year of operation with an ESP with four fans.

i. A description of typical operating scenarios in which the availability of a spare fan resulted in a decrease in short-term emissions, with an assessment of the changes in the hourly emission rates, with supporting documentation and calculations.

ii. A description of typical operating scenarios, if any, in which the availability of a spare fan resulted in an increase in short-term emissions, with an assessment of the changes in the hourly emission rates, with supporting documentation and calculations.

iii. An assessment of the overall effect of the addition of a fourth fan on actual annual emissions of the BOF, with supporting operating data and calculations.

d. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations by the Basic Oxygen Furnace Processes from applicable requirements, unless a NESHAP standard specifies a different timeframe, as follows:

A. Requirements in Condition 7.5.3.

B. Requirements in Condition 7.5.5-1.

C. Requirements in Condition 7.5.5-3.

D. Requirements in Condition 7.5.6(a) through (k).

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

iii. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

iv. All required deviation reports described in Condition 7.5.10(d) above shall contain the following information:

A. Date, time and duration of the deviation;

B. Description of the deviation;

C. Probable cause of the deviation; and

D. Any corrective action or preventative measures taken.

e. Reporting on malfunction and breakdown shall be performed in accordance with Condition 5.10.5-2

f. Reporting Requirements from Permit 10080021:

i. Within six months of initial startup of the steam rings on the affected BOFs, the Permittee shall submit to the Illinois EPA: 1) A Project Report; and 2) A draft of the Permittee's written operating procedures for the steam rings, as required by Condition 7.5.5-3(c), for review and comment by the Illinois EPA. This Project Report shall include the following:

A. An assessment, with supporting documentation, of the effect of the steam rings on the opacity and, as feasible, particulate loading of the exhaust from the roof monitor of the BOPF Shop during refining, correlated with the rate of steam injection and other operating parameters of the BOF's and their control system; and

B. An identification of circumstances, if any, in which the steam rings must be operated to maintain compliance with applicable emission standards.

ii. The Permittee shall submit reports to the Illinois EPA on a semi-annual basis that include the following information for the operation of the steam rings on the affected BOFs:

A. Total number of heats during the reporting period.

B. Number of heats during the reporting period without steam rings operating properly, by type of incident, e.g., breakdown of the steam ring interrupting operation, malfunction of the steam ring with insufficient steam flow, or breakdown of support system.

g. Reporting on the Federal SSM authorization shall be performed in accordance with Condition 5.10.5-3.

7.5.11 Operational Flexibility/Anticipated Operating Scenarios

The Basic Oxygen Furnaces shall only be operated as top oxygen injected vessels, except that, for purposes of checkout and emission testing only, the furnaces may be operated as peripheral and bottom oxygen injected furnaces for a maximum of

120 days. Any further operation of the furnaces as other than top oxygen injected vessels shall be pursuant to a permit granted for such additional operation [72080043].

7.5.12 Compliance Procedures

a. Compliance with the applicable standards of Condition 7.5.3 is addressed by the work practices, testing, monitoring, recordkeeping and reporting requirements in Section 7.5 of this permit.

b. Compliance with the production/emission limits of Conditions 7.5.6 and 5.6.2 is addressed by the work practices, testing monitoring, recordkeeping and reporting requirements in Sections 7.5 and 5 of this permit.

7.5.13 Compliance Schedule and Current Enforcement Status

a. The Permittee shall comply with the following schedule of compliance applicable to BOF shop emissions and established in accordance with modified Consent Order 05-CH-750 (December 23, 2009):

Commitment	Timing
Certify compliance	March 31, 2011

b. Submittal of Progress Reports

Quarterly Progress Reports shall be submitted beginning with September 2011 and ending upon the achievement of compliance. Each quarterly report shall be submitted no later than 5 days after the end of the corresponding calendar month. The Progress Report shall contain at least the following:

i. The required date for achieving commitments, and actual dates when such commitments were achieved.

ii. Any commitments accepted by the Permittee or otherwise established for the affected BOF as part of the resolution of the above referenced Consent Order, with the associated timing for each commitment.

iii. A discussion of progress in complying with commitments that are subject to future deadlines.

iv. If any commitment was not met, an explanation of why the required timeframe or commitment was not met, and any preventive or corrective measures adopted to achieve required commitment.

c. After completion of all required commitments and certification of compliance, as identified in Condition

7.5.13(a) no further Quarterly Progress Reports are required to be submitted.

7.5.14 State-Only Conditions

State-only conditions are not being established.

7.6 Continuous Casting

7.6.1 Description

There are two continuous casting lines in operation in the caster building. Ladles of molten steel are hoisted by crane and placed in revolving turrets located at the top of the casters. Each turret holds two ladles at a time. When one ladle of steel has been cast the turret is rotated and the second ladle is tapped. The empty ladle is then replaced with a full one. The tapping process involves opening the taphole located on the bottom of the ladle and allowing the molten steel to flow into an intermediate chamber called a “Tundish”. The Tundish has a taphole in the bottom through which the molten steel flows directly into the casters. The Tundish maintains a steady stream of molten steel flowing into the caster while ladles are being changed.

The molten steel from the casters continuously passes through a system of rollers and straighteners. Water is sprayed onto the slab throughout this process to complete the solidification of the slab.

Note: This narrative description is for informational purposes only and is not enforceable.

7.6.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
Continuous Casting	Steel Deslagging Station	Pre-1986	None
	Caster Molds 1 and 2	Pre-1990	None
	Casters #1 and #2: Spray Chambers	Pre-1981 (#1) Around 1988 (#2)	None
	Slab Cut-off	N/A	None
	Slab Ripping	N/A	None

7.6.3 Applicable Provisions and Regulations

a. The “affected continuous casting operations” for the purpose of these unit-specific conditions are the operations and emission units described in Conditions 7.6.1 and 7.6.2.

b. Pursuant to 35 IAC 212.458(b) and (c), the affected continuous casting operations shall comply with the following:

No person shall cause or allow emissions of PM_{10}, other than that of fugitive particulate matter, into the atmosphere to exceed the following limits during any one hour period:

i. 22.9 mg/scm (0.01 gr/scf) from any process emissions unit provided however that this limit shall not apply if there are no visible emissions, except if a stack test is performed, the absence of visible emissions is not a defense to a finding of violation [35 IAC 212.458(b)(7) and (c)]; and

ii. 5 percent opacity for continuous caster spray chambers or continuous casting operations [35 IAC 212.458(b)(8)].

Note: These standards currently do not apply to slab cut-off and slab ripping processes which are not vented through stacks.

c. Pursuant to 35 IAC 212.316(f), the affected continuous casting operations shall comply with the following:

No person shall cause or allow fugitive particulate matter emissions from any emission unit to exceed an opacity of 20 percent.

7.6.4 Non-Applicability of Regulations of Concern

a. The emission limitations of 35 IAC 212.324 are not applicable to any emission unit subject to a specific emissions standard or limitation contained in 35 IAC Part 212 Subpart R, Primary and Fabricated Metal Products and Machinery Manufacture, pursuant to 35 IAC 212.324(a)(3).

b. The affected continuous casting operations are not subject to 40 CFR Part 63 Subpart FFFFF, Integrated Iron and Steel Manufacturing, because continuous casting is not defined as part of BOPF and shop ancillary operations in 40 CFR 63.7782(c).

c. The affected continuous casting operations are not subject to 35 IAC 212.309 and 212.310 because those operations are not identified in 35 IAC 212.304 through 212.308.

7.6.5 Control Requirements and Work Practices

Pursuant to 35 IAC 212.450, particulate matter emissions from liquid steel charging in continuous casting operations shall be controlled by chemical or mechanical shrouds.

7.6.6 Production and Emission Limits from Permit 95010001 [T1]:

a. Emissions from Deslagging Station and associated Material Handling System (see Section 7.1) shall not exceed the following limits:

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.00355	6.35
PM_{10}	0.00355	6.35

b. Emissions from Caster Molds – Casting shall not exceed the following limits:

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.006	10.74
PM_{10}	0.006	10.74
NO_x	0.050	89.50

c. Emissions from Casters Spray Chambers shall not exceed the following limits:

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.00852	15.25
PM_{10}	0.00852	15.25

d. Emissions from Slab Cut-off shall not exceed the following limits:

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.0071	12.71
PM_{10}	0.0071	12.71

e. Emissions from Slab Ripping shall not exceed the following limits:

Pollutant	Emission Factor (Lbs/Ton)	Maximum Emissions (Tons/Yr)
PM	0.00722	12.92
PM_{10}	0.00722	12.92

f. Total Emissions from Continuous Casting operations shall not exceed the following limits:

	PM (Tons/Yr)	PM_{10} (Tons/Yr)	NO_x (Tons/Yr)
Continuous Casting Operations	71	71	90.0

g. Compliance with annual limits shall be determined on a calendar year basis [T1].

7.6.7 Testing Requirements

a. The Permittee shall conduct opacity observations for the affected continuous casting operations as specified below [Sections 39.5(7)(d) and (p) of the Act]:

i. Semi-annual observations shall be performed by a qualified observer in accordance with USEPA Method 9 for each spray chamber stack and continuous caster building openings while the casters are operating. The duration of opacity observations for each stack and the building shall be at least 30 minutes unless no visible emissions are observed from a stack or the building during the first 12 minutes of observations.

ii. Upon written request by the Illinois EPA, additional opacity observations shall be conducted within 5 operating days from the date of the request or by the date agreed upon by the Illinois EPA, whichever is later. For these observations:

A. The Permittee shall notify the Illinois EPA at least 24 hours in advance of the date and time of these observations, in order to enable the Illinois EPA to witness the observations. This notification shall include the name and employer of the qualified observer(s).

B. The Permittee shall promptly notify the Illinois EPA of any changes in the time or date for observations.

C. The duration of these observations shall be three hours for each spray chamber stack.

D. The Permittee shall provide a copy of the current certification for the opacity observer and observer’s readings to the Illinois EPA at the time of the observations, if the Illinois EPA personnel are present.

b. The Permittee shall have emission tests conducted for the PM/PM_{10} emissions of the spray chambers of the affected continuous casting operations as specified below to verify

compliance with emission limits in Condition 7.6.6(c) [Sections 39.5(7)(d) and (p) of the Act]:

i. A. Emission testing shall be conducted within 30 months of the effective date of this permit condition. This testing shall be conducted for one caster as selected by the Illinois EPA.

B. Upon written request from the Illinois EPA, additional emission testing shall be conducted within 90 operating days from the date of the request or by the date agreed upon by the Illinois EPA, whichever is later.

ii. The following USEPA test methods shall be used for this testing, unless another USEPA method is approved by the Illinois EPA:

A.	Location of Sample Points	Method 1
B.	Gas Flow and Velocity	Method 2
C.	Flue Gas Weight	Method 3
D.	Moisture	Method 4
E.	PM/PM_{10}	Methods 5, 201 or 201A

iii. Observations for visible emissions and opacity shall be conducted during all emission tests in accordance with USEPA Methods 22 and 9, respectively, and the results of these observations included in the reports for emission testing.

iv. For this emission testing, test notifications and reporting shall be done by the Permittee in accordance with Conditions 8.6.2 and 8.6.3 of this permit.

7.6.8 Monitoring Requirements

The Permittee shall perform monthly inspections of the continuous casting operations. These inspections shall include [Sections 39.5(7)(a) and (d) of the Act]:

a. Inspection of the mechanical shrouds on the continuous casting operations to ensure their physical presence and integrity.

b. Observations for visible emissions from stacks conducted in accordance with Method 22. If visible emissions are observed, opacity observations by Method 9 shall be conducted within one week.

7.6.9 Recordkeeping Requirements

The Permittee shall maintain records of the following items for the affected continuous casting operations, pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. Amount of steel cast (ton/mo and ton/yr).

b. The Permittee shall maintain records of the inspections required by Condition 7.6.8.

c. The Permittee shall keep the following records related to the emissions of the affected continuous casting operations:

i. A file containing the emission factors used by the Permittee to determine emissions of different pollutants from the various affected operations, with supporting documentation. These records shall be reviewed and updated by the Permittee as necessary to assure that the emission factors that it uses to determine emissions of the affected operations do not understate actual emissions. These records shall be prepared and copies sent to the Illinois EPA in accordance with Condition 5.9.6(c).

ii. Records for any periods of operation of an affected operations that are not otherwise addressed in the required records during which the established emission factor in Condition 7.6.9(c)(i) would understate actual emissions, with description of the period of operation and an estimate of the additional emissions during such period that would not be accounted for by the established factor, with supporting explanation and calculations.

iii. Records for the annual emissions of the various affected operations for comparison to the limits in Conditions 7.6.6(a) through (e), with supporting calculations.

iv. Records for combined annual emissions of the affected continuous casting operations, based on the summation of the above data, for comparison to the limits in Condition 7.6.6(f).

d. The Permittee shall keep records for all opacity readings for the affected continuous casting operations conducted in accordance with Condition 7.6.7.

7.6.10 Reporting Requirements

a. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations by

the affected continuous casting operations from applicable requirements, as follows:

A. Requirements in Condition 7.6.3(b) and (c).

B. Requirements in Condition 7.6.6.

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

b. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

c. All deviation reports described in Condition 7.6.10 above shall contain the following:

i. Date, time and duration of the deviation;

ii. Description of the deviation;

iii. Probable cause of the deviation; and

iv. Any corrective action or preventive measures taken.

7.6.11 Operational Flexibility/Anticipated Operating Scenarios

Operational flexibility is not set for the affected continuous casting operations.

7.6.12 Compliance Procedures

For affected continuous casting, compliance with the applicable standards of Conditions 7.6.3(b) and (c) and with the limitations of Condition 7.6.6 is addressed by the work practices, testing, monitoring, recordkeeping and reporting requirements in Section 7.6 of this permit.

7.6.13 State-Only Conditions

State-only conditions are not being established.

7.7 Hot Strip Mill Reheat Furnaces

7.7.1 Description

Steel slabs are heated in the slab reheat furnaces, so they can be formed further in the facility's hot strip mill. Some of the slabs are shipped to the facility from outside suppliers.

The following fuels or combination of these fuels are fired by all the four furnaces: natural gas and coke oven gas (COG). In the past, the reheat furnaces also fired oil, but they no longer have that capability.

Note: This narrative description is for informational purposes only and is not enforceable.

7.7.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
Reheat Furnaces	Slab Reheat Furnaces #1, #2 & #3 equipped with low-NO_x burners Nominal firing rate: 322 mmBtu/hr each	Pre-1972	None
	Slab Reheat Furnace #4 equipped with low-NO_x burners Nominal firing rate: 495 mmBtu/hr	Pre-1977	None

7.7.3 Applicable Provisions and Regulations

a. The "affected slab reheat furnaces" for the purpose of these unit-specific conditions, are the emission/production units as described in Conditions 7.7.1 and 7.7.2 above.

b. The affected slab reheat furnaces are subject to 35 IAC 212.458(b)(10) and (c), which provide that no person shall cause or allow emissions of PM_{10}, other than that of fugitive particulate matter, into the atmosphere to exceed 38.7 ng/J (0.09 lbs/mmBtu) of heat input from the slab furnaces at steel plants in the vicinity of Granite City during any one hour period, provided however that this limit shall not apply if there are no visible emissions, except if a stack test is performed, the absence of visible emissions is not a defense to a finding of violation.

c. The affected slab reheat furnace #4 is subject to 35 IAC 212.321(a), which provides that:

No person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit, which either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in 35 IAC 212.321(c) (See also Attachment 2) [35 IAC 212.321(a)].

d. The affected slab reheat furnaces #1, #2 and #3 are subject to 35 IAC 212.322(a), which provides that:

No person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any process emission unit for which construction or modification commenced prior to April 14, 1972, which, either alone or in combination with the emission of particulate matter from all other similar existing process emission units at a source or premises, exceeds the allowable emission rates specified in 35 IAC 212.322(c) (See also Attachment 2) [35 IAC 212.322(a)].

e. Pursuant to 35 IAC 214.301, the affected slab reheat furnaces shall comply with the following: no person shall cause or allow the emission of sulfur dioxide into the atmosphere from any process emission source to exceed 2000 ppm.

f. Pursuant to 35 IAC 212.123(a), the affected slab reheat furnaces shall comply with the following: no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to the requirements of 35 IAC 212.122, except as allowed by 35 IAC 212.123(b) and 212.124.

g. Pursuant to 35 IAC 212.458(b)(7) and (c), the affected slab reheat furnaces shall comply with the following:

No person shall cause or allow emissions of PM_{10}, other than that of fugitive particulate matter, into the atmosphere to exceed the following limits during any one hour period:

22.9 mg/scm (0.01 gr/scf) from any process emissions unit provided however that this limit shall not apply if there are no visible emissions, except if a stack test is performed, the absence of visible emissions is not a defense to a finding of violation [35 IAC 212.458(b)(7) and (c)].

7.7.4 Non-Applicability of Regulations of Concern

a. The emission limitations of 35 IAC 212.324 are not applicable to the affected slab reheat furnaces, because

they are subject to a specific emissions standard or limitation contained in 35 IAC Part 212 Subpart R, pursuant to 35 IAC 212.324 (a)(3).

b. The affected slab reheat furnaces are not subject to 40 CFR Part 63 Subpart FFFFF, Integrated Iron and Steel Manufacturing, because reheat furnaces are not covered by this NESHAP [see 40 CFR 63.7782(c)].

c. This permit is issued based on the Permittee not being subject to the work practice and recordkeeping requirements of 35 IAC 212.324(f) because the affected slab reheat furnaces do not use air pollution control equipment for particulate matter.

7.7.5 Startup Provisions

a. Pursuant to 35 IAC 201.149 and Part 201 Subpart I, subject to the following terms and conditions for affected slab reheat furnaces, the Permittee is authorized to violate the applicable opacity standards in 35 IAC 212.123(a) of Condition 7.7.3(f) during startup.

Note: This authorization is provided because the Permittee applied for such authorization in its CAAPP application, generally describing the efforts that will be used "…to minimize startup emissions, duration of individual starts, and frequency of startups".

i. This authorization does not relieve the Permittee from the continuing obligation to demonstrate that all reasonable efforts are made to minimize startup emissions, duration of individual startups and frequency of startups.

ii. The Permittee shall conduct startup of the affected slab reheat furnaces in accordance with written procedures prepared by the Permittee and maintained at the source (see Condition 7.7.10(d)(i)) for the affected slab reheat furnaces, that are specifically developed to minimize emissions from startups and that include, at a minimum:

A. A review of the operational condition of the affected reheat furnaces prior to initiating startup of the furnaces;

B. Initiation of startups to provide adequate time to implement the established startup procedures;

C. Sequential startup of the burners in the different zones of each furnace; and

D. Temperature levels achieved during startup.

iii. The Permittee shall fulfill applicable recordkeeping of Condition 7.7.10(d).

iv. The Permittee shall fulfill applicable reporting of Condition 5.10.5-1.

b. As provided by 35 IAC 201.265, an authorization in a permit for excess emissions during startup does not shield a Permittee from enforcement for any violation of applicable emission standard(s) that occurs during startup and only constitutes a prima facie defense to such an enforcement action provided that the Permittee has fully complied with all terms and conditions connected with such authorization.

7.7.6 Control Requirements and Work Practices

a. Pursuant to Permit 06070022, the affected slab reheat furnaces shall be equipped, operated, and maintained with low NO_x burners. The low NO_x burners shall be operated and maintained in conformance with good air pollution control practices. These low-NO_x burners shall be operated in the following zones of the affected slab reheat furnace [T1R]:

i. Slab reheat furnaces #1 through #3: heat and intermediate zones; and

ii. Slab reheat furnace #4: heat zone.

b. The affected slab reheat furnaces are allowed to burn natural gas and coke oven gas only as a fuel [Section 39.5(7)(a)of the Act].

7.7.7 Operating and Emission Limits

The following operating and emission limits are established for the affected slab reheat furnaces [06070022, T1]:

a. Operation of the affected slab reheat furnaces shall not exceed the following limits:

Emission Unit	Total Gas Usage (mmBtu/year)	COG Usage (mmBtu/year)
Slab Reheat Furnace #3	1,654,304	1,187,790
Slab Reheat Furnace #4	2,206,238	1,544,367
Total (Furnaces 1-4)	7,169,150	2,421,388

b. Emissions of NO_x from the affected slab reheat furnaces shall not exceed the following limits:

Furnace	Limit (Lbs/mmBtu)
Slab Reheat Furnace #1	0.150
Slab Reheat Furnace #2	0.150
Slab Reheat Furnace #3	0.264
Slab Reheat Furnace #4	0.283

c. Emissions of NO_x from the affected slab reheat furnaces (combined) shall not exceed 73 tons/month and 724.09 tons/year.

d. Compliance with above annual limits shall be determined from a running total of 12 months of data.

7.7.8 Testing Requirements

a. Pursuant to Section 39.5(7)(d) and (p) of the Act, the Permittee shall conduct a performance test on each affected slab reheat furnace within 18 months of the effective date of this permit condition and furnish the Illinois EPA a written report of the results of such test(s).

i. These tests shall be conducted while the reheat furnace is firing COG at the maximum level in the normal mix of fuel for the furnace.

ii. The following methods and procedures shall be used for testing of emissions, unless another method is approved by the Illinois EPA: Refer to 40 CFR 60, Appendix A, for USEPA test methods.

Location of Sample Points	USEPA Method 1
Gas Flow and Velocity	USEPA Method 2
Flue Gas Weight	USEPA Method 3
Moisture	USEPA Method 4
NO_x	USEPA Method 7E or 19

b. The Permittee shall conduct tests for PM/PM_{10} and NO_x emissions of the affected reheat furnaces upon written request from the Illinois EPA, for furnace(s) and fuel mix, as specified in the request. This testing shall be completed within 90 days of the request of by such later date agreed to by the Illinois EPA. For NO_x, this testing shall be conducted in accordance with Condition 7.7.8(a)(i). For PM/PM_{10}, testing shall be conducted using USEPA Test Methods as specified in 35 IAC 212.108(a).

c. For all required emission tests, the Permittee shall conduct opacity observations in accordance with USEPA Method 9 during each run and report the results in the test report. The duration of observations for each run shall be 30-minutes unless visible emissions are not observed during

the first 12 minutes. Notwithstanding the above, if weather conditions during the period of testing are not suitable for conducting opacity observations, observations may be conducted within 48 hours of the time of testing, in which case, the duration of observations shall be 3 hours unless visible emissions are not observed during the first 36 minutes of observations.

d. With the reports for all emission testing, the Permittee shall also provide the sulfur content of the COG being combusted during the period of testing, as measured by the monitoring system for COG, and sulfur content of the mixed fuel combusted during the period of testing, with supporting calculations.

e. For this emission testing, test notifications and reporting shall be done by the Permittee in accordance with Conditions 8.6.2 and 8.6.3 of this permit.

7.7.9 Monitoring Requirements

The affected slab reheat furnaces are subject to the following monitoring requirements, pursuant to Sections 39.5(7)(a) and (d) of the Act:

a. The Permittee shall conduct opacity observations for each affected slab reheat furnace on a semi-annual basis, in accordance with USEPA Method 9, for a minimum of 30 minutes per furnace, unless no visible emissions are observed during the first 12 minutes of observations. The results of these observations shall be reported to the Illinois EPA within 45 days after each observation is conducted.

b. Unless annual performance tests or continuous monitoring for emissions of NO_x is being conducted for an affected slab reheat furnace pursuant to 35 IAC Part 217, Subpart D, the Permittee shall perform combustion evaluations/inspections of the burners on each affected slab reheat furnace on a regular basis, including inspections of the various components of the burner for their condition and proper functioning, and diagnostic measures of the NO_x concentration in the exhaust of the furnace before and after performance evaluation. These inspections/evaluations shall be conducted on a semi-annual basis if accommodated by the schedule for maintenance outages on an affected furnace, and otherwise on at least an annual basis.

7.7.10 Recordkeeping Requirements

The Permittee shall maintain records of the following items for the affected slab reheat furnaces, pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. i. Records for heat input:

A. For COG (mmBtu/month and mmBtu/year) for all affected slab reheat furnaces (combined) and for furnaces #3 and #4 (individually).

B. For natural gas (mmBtu/month and mmBtu/year) for all affected slab reheat furnaces (combined) and for furnaces #3 and #4 (individually).

ii. Records for the amount for each type of fuel used (mmscf/mo).

b. A log or other records that will serve to identify the fuel or fuels being fired during each hour in each affected reheat furnace:

i. For furnaces # 1, 2 and 3, whether natural gas or COG is being fired.

ii. For furnace #4, the setting for the mix of natural gas and COG that is being fired.

c. Records for all emission tests and opacity observations for the affected slab reheat furnaces.

d. Records for Startups of Affected Slab reheat furnaces, pursuant to Section 39.5(7)(b) of the Act

i. The Permittee shall maintain startup procedures for each affected slab reheat furnace, as required by Condition 7.7.5(a)(ii).

ii. The Permittee shall maintain the following records for each startup of an affected furnace:

A. Date, time and duration of the startup.

B. A description of the startup and reason(s) for the startup.

C. Whether a violation of an applicable standard may have occurred during startup accompanied by the information in Condition 7.7.9(d)(iv) if a violation may have or did occur.

D. Whether the established startup procedures, maintained above, were followed accompanied by the information in Condition 7.7.9(d)(iii) if there were departure(s) from those procedures.

iii. If the established startup procedures were not followed during a startup, the Permittee shall maintain the following records:

A. A description of the departure(s) from the established procedures.

B. The reason(s) for the departure(s) from the established procedures.

C. An explanation of the consequences of the departure(s) for emissions, such as whether the departure(s) prolonged the startup or resulted in additional emissions, and if so,

1. The actions taken to minimize emissions and the duration of the startup; and

2. An explanation whether similar incidents might be prevented in the future and if so, the corrective actions taken or to be taken to prevent similar incidents.

iv. If a violation did or may have occurred during a startup, the Permittee shall maintain the following records:

A. Identification of the applicable standard(s) that were or may have been violated.

B. An explanation of the nature of such violation(s), including the magnitude of such excess emissions.

C. A description of the actions taken to minimize the magnitude of emissions and duration of the startup.

D. An explanation whether similar incidents could be prevented or ameliorated in the future and if so, a description of the actions taken or to be taken to prevent similar incidents in the future.

e. A maintenance and repair log for each affected slab reheat furnace, listing each activity performed with date.

f. The following records related to the emissions of PM/PM_{10}, SO_2, and NO_x from the affected slab reheat furnaces:

i. A file containing the emission factors used by the Permittee to determine emissions of pollutants other than SO_2 from the affected slab reheat furnaces, with supporting documentation. These records shall be reviewed and updated by the Permittee as necessary to assure that the emission factors that it uses to determine emissions of the affected furnace do not understate actual emissions. These records shall be

prepared and copies sent to the Illinois EPA in accordance with Condition 5.9.6(c).

ii. If different emission factors are used for furnaces #1 and #2, records for the individual usage of fuels by these furnaces (scf/month and scf/year).

iii. Records of emissions of PM/PM_{10}, SO_2, NO_x from the affected slab reheat furnaces (tons/month and tons/year), with supporting calculations.

7.7.11 Reporting Requirements

a. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations by the affected slab reheat furnaces from applicable requirements, as follows:

A. Requirements in Condition 7.7.3(b) through (f).

B. Requirements in Condition 7.7.6.

C. Requirements in Condition 7.7.7.

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

b. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

c. All deviation reports described in Condition 7.7.11 above shall contain the following:

i. Date, time and duration of the deviation;

ii. Description of the deviation;

iii. Probable cause of the deviation; and

v. Any corrective action or preventive measures taken.

d. Reporting on the State startup authorization shall be performed in accordance with Condition 5.10.5-1.

7.7.12 Operational Flexibility/Anticipated Operating Scenarios

No operational flexibility has been established for the affected slab reheat furnaces.

7.7.13 Compliance Procedures

For affected slab reheat furnaces, compliance with the applicable standards of Condition 7.7.3 and with the operating and emission limits of Condition 7.7.7 is addressed by the work practices, testing, monitoring, recordkeeping and reporting requirements in Section 7.7 of this permit.

7.7.14 State-Only Conditions

Pursuant to 35 IAC 217.150, 217.152, and 217.160, by the applicable compliance date for 35 IAC Part 217 Subparts D and I, the Permittee shall comply with applicable requirements of these rules for the affected slab reheat furnaces, including:

a. Certifying to the Illinois EPA that the affected slab reheat furnaces will be in compliance with the applicable emission limitation(s) of 35 IAC 217.244(a) by the applicable compliance date.

b. Operation of each affected slab reheat furnaces in a manner consistent with good air pollution control practices to minimize NO_x emissions,

c. Compliance with the applicable NO_x emission limitation(s) in accordance with 35 IAC 217.154 or 217.157.

d. Compliance with the applicable monitoring, recordkeeping and reporting requirements in accordance with 35 IAC 217.157(b) and 217.156.

7.8 Finishing Operations

7.8.1 Description

Pickling Line:

Coils are processed in this unit to clean the steel and prepare it for other treatments such as cold rolling or galvanizing. At the start of the pickling line, the coils are unwound and the leading edge of each coil is trimmed off square. The leading edge of each coil is then spot (resistance) welded to the trailing edge of the previous coil. By joining the coils in this manner the pickling line runs a continuous ribbon of steel and does not need to be taken out of production to reload. After the steel coils are joined the steel is passed through an acid bath. This acid bath consists of four dip tanks arranged in series and uses a solution of hydrochloric acid and water to clean the surfaces of the steel sheet. A scrubbing system with mist eliminator is used to control hydrogen chloride emissions from this process. When the steel comes out of the fourth acid dip tank it is passed through a cold rinse tank in which cool water is used to rinse the acid off of the steel. The next step is to pass the steel through a hot rinse tank. In this tank hot water is used to rinse any remaining acid away from the steel and to raise the temperature of the steel to speed the drying process. The steel is then passed through a hot air dryer to complete the drying process. The steel that is to be shipped is coated with oil immediately prior to recoiling to inhibit corrosion. In the final step of the pickling process, the steel is recoiled.

Galvanizing Line Steel Preparation:

Steel coils that are to be galvanized in this unit are first joined end to end by spot (resistance) welding the leading edge of one coil to the trailing edge of another coil. The steel is then passed through a rinse station where it is rinsed with either a weak alkaline solution or a weak acid solution. The purpose of this rinse is to clean the steel and break down any oils that may be on the surfaces. The emissions from this unit are exhausted to a packed column wet scrubber. After cleaning and rinsing the steel is dried by a steam dryer.

Galvanizing Line Finishing Processes:

After the steel is coated with zinc, it is cooled and then dipped into a “Chem-treat” bath. This non-organic chemical puts a layer of rust-preventative on the steel. The steel is coated with oil to protect the surfaces, recoiled, and sprayed with edge sealer (oil) to protect the edges of the steel. The oil applied to the steel is a light petroleum based oil used to inhibit corrosion. Edge sealers are oils used to protect the edges of the steel and inhibit corrosion.

Note: This narrative description is for informational purposes only and is not enforceable.

7.8.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
Finishing Operations	HCL Pickling Line	Pre-1973	Two Fume Scrubbers
	Galvanizing Line #7A; the line is comprised of the following significant components: • Cleaner section • Natural Gas furnace • Galvanizing pot • Miscellaneous heaters	Pre-1973	Fume Scrubber
	Galvanizing Line #8; the line is comprised of the following significant components: • Cleaner Section (with fume scrubber) • Natural gas fired Furnace (with NO_x catalytic converter) • 2 Galvanizing Pots • Space Heaters • Miscellaneous Heaters • Melting Kettle Building and Storage Areas Heaters	1995	Fume Scrubber; NO_x catalytic converter
	Coating Operations	Pre-1973	None

7.8.3 Applicable Provisions and Regulations

a. The “affected finishing operations” for the purpose of these unit-specific conditions, are the emission units described in Conditions 7.8.1 and 7.8.2.

b. Pursuant to 35 IAC 212.458(b)(7) and (c), the affected finishing operations shall comply with the following:

No person shall cause or allow emissions of PM_{10}, other than that of fugitive particulate matter, into the atmosphere to exceed the following limits during any one hour period:

22.9 mg/scm (0.01 gr/scf) from any process emissions unit provided however that this limit shall not apply if there are no visible emissions, except if a stack test is performed. The absence of visible emissions is not a defense to a finding of violation [35 IAC 212.458(b)(7) and (c)]

c. The following process emission units in the affected finishing operation constructed or modified prior to April 14, 1972 are subject to IAC 212.322(a): cleaner section and galvanizing pot of Galvanizing Line #7A and coating operations. No person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any process emission unit for which construction or modification commenced prior to April 14, 1972, which, either alone or in combination with the emission of particulate matter from all other similar process emission units at a source or premises, exceeds the allowable emission rates specified in subsection (c) of 35 IAC 212.322 (see also Attachment 2) [35 IAC 212.322(a)].

d. The following process emission units in the affected finishing operation constructed or modified on or after April 14, 1972 are subject to IAC 212.321(a): cleaner section, two galvanizing pots and the melting kettle of Galvanizing Line #8. No person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any process emission unit for which construction or modification commenced on or after April 14, 1972, which, either alone or in combination with the emission of particulate matter from all other similar process emission units at a source or premises, exceeds the allowable emission rates specified in subsection (c) of 35 IAC 212.321 (see also Attachment 2) [35 IAC 212.321(a)].

e. Coating operations performed as part of the affected finishing operations are subject to 35 IAC 219.204, with which the Permittee must comply by application of compliant coating as established by 35 IAC 219.204(d) for coil coating:

i. No owner or operator of an affected coil coating operation shall apply at any time any coating in which the VOM content exceeds the following emission limitations. The following emission limitation is expressed in units of VOM per volume of coating (minus water and any compounds which are specifically exempted from the definition of VOM) as applied at each coating applicator:

kg/l	lb/gal
0.20	1.7

ii. Compounds which are specifically exempted from the definition of VOM should be treated as water for the purpose of calculating the “less water” part of the coating composites.

f. The HCL pickling line operates as a part of the affected finishing operations and is subject to 40 CFR Part 63 Subpart CCC “National Emission Standards for Hazardous Air Pollutants for Steel Pickling—HCl Process Facilities and Hydrochloric Acid Regeneration Plants”. Specific requirements of Subpart CCC are set forth later in this subsection.

g. Pursuant to 35 IAC 212.123(a), no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to the requirements of 35 IAC 212.122, except as allowed by 35 IAC 212.123(b) and 212.124.

7.8.4 Non-Applicability of Regulations of Concern

a. The emission limitations of 35 IAC 212.324 are not applicable to any emission unit subject to a specific emissions standard or limitation contained in 35 IAC Part 212 Subpart R, pursuant to 35 IAC 212.324 (a)(3).

b. This permit is issued based on the coating operations operated as a part of the affected finishing operations not being subject to 40 CFR 63 Subpart SSSS “National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Coil” pursuant to the definition of coating used by Subpart SSSS (Decorative, protective, or functional materials that consist only of solvents, protective oils, acids, bases, or any combination of these substances are not considered coatings for the purposes of Subpart SSSS).

c. This permit is issued based on the coating operations operated as a part of the affected finishing operations not being subject to 40 CFR 63 Subpart MMMM “National Emission Standards for Hazardous Air Pollutants for Surface Coating of Miscellaneous Metal Parts and Products” pursuant to definition of coating used by Subpart MMMM (Decorative, protective, or functional materials that consist only of solvents, protective oils, acids, bases, or any combination of these substances are not considered coatings for the purposes of Subpart MMMM).

d. The pickling operations are not subject to 35 IAC 212.321 or 212.322 pursuant to 35 IAC 266.190.

7.8.5-1 NESHAP Emission Standards

a. The affected pickling line is subject to 40 CFR 63.1157(a), which provides that no owner or operator of an existing affected continuous or batch pickling line at a steel pickling facility shall cause or allow to be discharged into the atmosphere from such line:

i. Any gases that contain HCl in a concentration in excess of 18 parts per million by volume (ppmv); or

ii. HCl at a mass emission rate that corresponds to a collection efficiency of less than 97 percent.

b. This standard shall apply at all times, including startup, shutdown and malfunction/breakdown, as 40 CFR 63.6(f) has been vacated.

7.8.5-2 NESHAP Work Practices (Galvanizing Lines)

Affected Galvanizing Furnaces #7A and #8 as well as miscellaneous heaters on Galvanizing Line #8 are subject to the NESHAP, 40 CFR Part 63, Subpart DDDDD. Pursuant to 40 CFR 63.7499, these affected units are in the Gas 1 Subcategory for purposes of this NESHAP, as they only burn natural gas.

a. Beginning on of the compliance date of this NESHAP, the Permittee must conduct a tune-up on each affected unit as follows:

i. For Galvanizing Furnaces #7A and #8, the Permittee must conduct a tune-up of each furnace annually [40 CFR 63.7540(a)(10)].

ii. For miscellaneous heaters on galvanizing line #8, the Permittee must conduct a biennial tune-up of each heater [40 CFR 63.7540(a)(11)].

iii. If a unit is not operating on the required date for a tune-up, the tune-up must be conducted within one week of startup [40 CFR 63.7540(a)(12)].

b. Pursuant to 40 CFR 63.7540(a)(10), each required tune-up shall consist of the following:

i. As applicable, inspect the burner, and clean or replace any components of the burner as necessary (the burner inspection may be delayed until the next scheduled unit shutdown, but each burner must be inspected at least once every 36 months) [40 CFR 63.7640(a)(10)(i)];

ii. Inspect the flame pattern, as applicable, and adjust the burner as necessary to optimize the flame pattern. The adjustment should be consistent with the manufacturer's specifications, if available [40 CFR 63.7640(a)(10)(ii)];

iii. Inspect the system controlling the air-to-fuel ratio, as applicable, and ensure that it is correctly calibrated and functioning properly [40 CFR 63.7640(a)(10)(iii)];

iv. Optimize total emissions of CO. This optimization should be consistent with the manufacturer's specifications, if available [40 CFR 63.7640(a)(10)(iv)];

v. Measure the concentrations in the effluent stream of CO in parts per million, by volume (ppmv), and oxygen in volume percent, before and after the adjustments are made (measurements may be either on a dry or wet basis, as long as it is the same basis before and after the adjustments are made) [40 CFR 63.7640(a)(10)(v)].

c. Pursuant to 40 CFR 63.7640(a)(10)(vi), the Permittee shall maintain on-site and submit, if requested by the Illinois EPA, an annual report containing the following for the required tune-ups:

i. The concentrations of CO in the effluent stream in ppmv, and oxygen in volume percent, measured before and after the adjustments of the furnace;

ii. A description of any corrective actions taken as a part of the combustion adjustment; and

iii. The type and amount of fuel used over the 12 months prior to the annual adjustment, but only if the unit was physically and legally capable of using more than one type of fuel during that period. Units sharing a fuel meter may estimate the fuel use by each unit.

7.8.6 Control Requirements and Work Practices

a. Hydrochloric acid storage vessels. The owner or operator of an affected vessel shall provide and operate, except during loading and unloading of acid, a closed-vent system for each vessel. Loading and unloading shall be conducted either through enclosed lines or each point where the acid is exposed to the atmosphere shall be equipped with a local fume capture system, ventilated through an air pollution control device [40 CFR 63.1159(b)].

Note: HCL storage tanks associated with the affected pickling line are insignificant activities addressed in

Section 3.0 of this permit. Loading and unloading is currently conducted through enclosed lines.

b. Maintenance requirements [40 CFR 63.1160(b)]

i. The Permittee shall comply with the operation and maintenance requirements prescribed under 40 CFR 63.6(e) for the HCL pickling line.

ii. In addition to the requirements specified in 40 CFR 63.6(e), the Permittee shall operate in accordance with an operation and maintenance plan that it prepares for each emission control device. Such plan shall be consistent with good maintenance practices and, for a scrubber emission control device, shall at a minimum address the following:

A. Require monitoring and recording the pressure drop across the scrubber once per shift while the scrubber is operating in order to identify changes that may indicate a need for maintenance;

B. Require the manufacturer’s recommended maintenance at the recommended intervals on fresh solvent pumps, re-circulating pumps, discharge pumps, and other liquid pumps, in addition to exhaust system and scrubber fans and motors associated with those pumps and fans;

C. Require cleaning of the scrubber internals and mist eliminators at intervals sufficient to prevent buildup of solids or other fouling;

D. Require an inspection of each scrubber at intervals of no less than 3 months with:

1. Cleaning or replacement of any plugged spray nozzles or other liquid delivery devices;

2. Repair or replacement of missing, misaligned, or damaged baffles, trays, or other internal components;

3. Repair or replacement of droplet eliminator elements as needed;

4. Repair or replacement of heat exchanger elements used to control the temperature of fluids entering or leaving the scrubber; and

5. Adjustment of damper settings for consistency with the required air flow.

E. If the scrubber is not equipped with a viewport or access hatch allowing visual inspection, alternate means of inspection approved by the Administrator may be used.

F. The owner or operator shall initiate procedures for corrective action within 1 working day of detection of an operating problem and complete all corrective actions as soon as practicable. Procedures to be initiated are the applicable actions that are specified in the maintenance plan. Failure to initiate or provide appropriate repair, replacement, or other corrective action is a violation of the maintenance requirement of 40 CFR 63, Subpart CCC.

G. The owner or operator shall maintain a record of each inspection, including each item identified in 40 CFR 63.1160(b)(2)(iv), that is signed by the responsible maintenance official and that shows the date of each inspection, the problem identified, a description of the repair, replacement, or other corrective action taken, and the date of the repair, replacement, or other corrective action taken.

7.8.7 Production and Emission Limits from Permit 95010005 [T1].

a. The operation of Galvanizing Line #8 shall not exceed the following [T1]:

i. The maximum firing rate of the furnace shall not exceed 54.6 million British thermal units (mmBtu) per hour.

ii. The maximum firing rate of each of the five space heaters shall not exceed 3.44 mmBtu/hour.

iii. The total combined maximum firing rate of the building and storage area heaters shall not exceed 9.84 mmBtu/hour.

iv. The total combined natural gas usage of the 11 miscellaneous heaters shall not exceed 21,895 ft^3/hour and 191.8 million ft^3/year.

v. The operation of the melting kettle shall not exceed 32,000 tons of product/month and 384,000 tons of product/year.

b. The emissions of Galvanizing Line #8 shall not exceed the following [T1]:

i. Furnace

A. The NO_x emissions of the furnace shall not exceed 2.07 lbs/hour and 9.04 tons/year.

B. Emissions of other pollutants from the furnace shall not exceed the following limits:

Carbon Monoxide:	8.37 tons/year
Particulate Matter:	0.72 tons/year
PM_{10}:	0.72 tons/year
VOM:	0.67 tons/year
SO_2:	0.14 tons/year

ii. Five Space Heaters (total)

A. The total combined NO_x emissions of the 5 space heaters shall not exceed 1.69 lbs/hour and 7.39 tons/year.

B. Total emissions of other pollutants from the 5 space heaters shall not exceed the following limits:

Carbon Monoxide:	1.48 tons/year
Particulate Matter:	0.22 tons/year
PM_{10}:	0.22 tons/year
VOM:	0.39 tons/year
SO_2:	0.04 tons/year

iii. Drying Oven and the Building and Storage Area Heaters (total)

A. The total combined NO_x emissions of the drying oven and the building and storage area heaters shall not exceed 0.97 lbs/hour and 4.29 tons/year.

B. Total emissions of other pollutants from the drying oven and the building and storage area heaters shall not exceed the following limits:

Carbon Monoxide:	0.85 tons/year
Particulate Matter:	0.13 tons/year
PM_{10}:	0.13 tons/year
VOM:	0.22 tons/year
SO_2:	0.03 tons/year

iv. Miscellaneous Heaters (total)

A. Total combined NO_x emissions of the 11 miscellaneous heaters shall not exceed 2.19 lbs/hour and 9.60 tons/year.

B. Total combined emissions of other pollutants from the 11 miscellaneous heaters shall not exceed the following limits:

Carbon Monoxide:	1.92 tons/year
Particulate Matter:	0.29 tons/year
PM_{10}:	0.29 tons/year
VOM:	0.51 tons/year
SO_2:	0.06 tons/year

v. Cleaner Section

Emissions of particulate matter from the cleaner section, which is controlled with a fume scrubber, shall not exceed 0.24 lbs/hour and 1.06 tons/year.

vi. Melting Kettle

Particulate matter emissions from the melting kettle shall not exceed 0.16 tons/month and 1.92 tons/year.

vii. Other emission units

Emissions of NO_x, CO, PM, VOM and SO_2 from the welder, two galvanizing pots and chemical treatment tank shall not exceed negligible rates of 0.1 lb/hour and 0.44 tons/year for each pollutant from each such emission unit.

c. Compliance with annual limits shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total) [T1].

7.8.8 Testing Requirements

a. For testing emissions of the HCl Pickling Line pursuant to 40 CFR 63, Subpart CCC:

i. The Permittee shall use the following test methods in Appendix A of 40 CFR Part 60 pursuant to 40 CFR 63.1161(d), unless an equivalent alternative measurement method is approved by the Administrator, to determine compliance under 40 CFR 63.1157(a):

A. Method 1, to determine the number and location of sampling points, with the exception that no traverse point shall be within one inch of the stack or duct wall;

B. Method 2, to determine gas velocity and volumetric flow rate;

C. Method 3, to determine the molecular weight of the stack gas;

D. Method 4, to determine the moisture content of the stack gas; and

E. Method 26A, “Determination of Hydrogen Halide and Halogen Emissions from Stationary Sources—Isokinetic Method,” to determine the HCl mass flows at the inlet and outlet of a control device or the concentration of HCl discharged to the atmosphere, and also to determine the concentration of Cl_2 discharged to the atmosphere from acid regeneration plants. If compliance with a collection efficiency standard is being demonstrated, inlet and outlet measurements shall be performed simultaneously. The minimum sampling time for each run shall be 60 minutes and the minimum sample volume 0.85 dry standard cubic meters (30 dry standard cubic feet). The concentrations of HCl and Cl_2 shall be calculated for each run as follows:

C_{HCl} (ppmv) = 0.659 C_{HCl} (mg/dscm),
and C_{C12} (ppmv) = 0.339 C_{C12} (mg/dscm),

where C(ppmv) is concentration in ppmv and C(mg/dscm) is concentration in milligrams per dry standard cubic meter as calculated by the procedure given in Method 26A.

ii. Pursuant to 40 CFR 63.1162(a)(1), the Permittee shall conduct performance tests a minimum of once every 2 years to measure the HCl mass flows at the control device inlet and outlet or the concentration of HCL exiting the control.

iii. If any performance test shows that the HCL emission limitation is being exceeded, then the owner or operator is in violation of the emission limit.

b. Upon written request from the Illinois EPA, emission tests shall be conducted by the Permittee for the furnace, melting kettle and cleaner section (all of galvanizing line #8) to verify compliance with emission limits in Condition 7.8.7, as follows [Section 39.5(7)(d) and (p) of the Act].

i. The following USEPA test methods shall be used, unless another USEPA method is approved by the Illinois EPA.

A.	Location of Sample Points	Method 1
B.	Gas Flow and Velocity	Method 2
C.	Flue Gas Weight	Method 3
D.	Moisture	Method 4
E.	PM/PM_{10} (furnace, kettle, and cleaner section)	Methods 5, 201 or 201A
vi.	NO_x (furnace)	Method 7E or 19

ii. Observations of opacity shall be conducted during these emission tests in accordance with Method 9 and the results of these observations included in the reports for emission testing.

c. Upon written request by the Illinois EPA, the Permittee shall conduct opacity observations from any finishing operation, as specified in the request, as follows [Sections 39.5(7)(d) and (p) of the Act]:

i. These observations shall be conducted within 45 calendar days of the requires or by the date agreed upon by the Illinois EPA, whichever is later.

ii. The readings shall be performed by a qualified observer in accordance with USEPA Method 9 while the affected finishing operation is operating.

d. For this testing, test notifications and reporting shall be done by the Permittee in accordance with Conditions 8.6.2 and 8.6.3 of this permit.

7.8.9 Monitoring Requirements

a. For the affected pickling line, the Permittee shall comply with the following requirements of 40 CFR 63.1160(b)(2) and 63.1162(a)(2) Section 39.5(7)(a):

i. The Permittee shall operate, and maintain systems for the measurement and recording of the scrubber makeup water flow rate and, if required, recirculation water flow rate. These flow rates shall be monitored continuously and recorded at least once per shift while the scrubber is operating.* If operation of the wet scrubber results in excursions of scrubber makeup water flow rate and recirculation water flow rate less than the minimum values established, the Permittee shall initiate corrective action within 1

working day as specified by the maintenance requirements in 40 CFR 63.1160(b)(2). Failure to initiate or provide appropriate repair, replacement, or other corrective action is a violation of the maintenance requirement of 40 CFR 63.1160(b)(2).

ii. The Permittee shall monitor and record the pressure drop across the scrubber once per shift* while the scrubber is operating in order to identify changes that may indicate a need for maintenance. The Permittee shall initiate procedures for corrective action within 1 working day of detection of an operating problem and complete all corrective actions as soon as practicable. Procedures to be initiated are the applicable actions that are specified in the maintenance plan. Failure to initiate or provide appropriate repair, replacement, or other corrective action is a violation of the maintenance requirement of 40 CFR 63.1160(b)(2).

* See also Condition 7.8.9(g)

iii. Corrective action as referenced in Condition 7.8.9(a)(i) and (ii) and as prescribed by “the Operation and Maintenance Plan” required by Condition 7.8.6(b)(ii), shall consist of the following:

A. Notify the pickle line shift manager or cold mill shift manager as soon as practicable but not later than the end of the shift of the operating problem detected.

B. The pickle line shift manager or cold mill shift manager shall notify the mechanical or electrical shift manager no later than the end of the shift.

C. Any of the above shift managers shall investigate the nature of the operating problem and implement corrective actions, such as manufacturer’s recommended maintenance on:

1. Pumps;

2. Exhaust systems;

3. Fans and motors;

4. Clean scrubber internals and mist eliminators to remove buildup of solids or other fouling.

D. The pickle line or cold mill shift manager shall complete an upset conditions report upon completion of corrected action.

b. Pursuant 40 CFR 63.1162(a)(4), failure to record each of the operating parameters (scrubber makeup water flow rate and recirculated water flow rate) is a violation of the monitoring requirements of 40 CFR 63 Subpart CCC.

c. Pursuant to 40 CFR 63.1162(a)(5), each monitoring device shall be certified by the manufacturer to be accurate to within 5 percent and shall be calibrated in accordance with the manufacturer's instructions but not less frequently than once per year.

d. Pursuant to 40 CFR 63.1161(b), the Permittee may reestablish compliant operating parameter values as part of any performance test that is conducted subsequent to the initial test or tests.

e. Pursuant to 40 CFR 63.1160(b)(2)(ii) through (iv), the Permittee shall conduct the following maintenance requirements:

   i. Cleaning of the scrubber internals and mist eliminators at intervals sufficient to prevent buildup of solids or other fouling;

   ii. Inspect each scrubber at intervals of no less than 3 months with:

      A. Cleaning or replacement of any plugged spray nozzles or other liquid delivery devices;

      B. Repair or replacement of missing, misaligned, or damaged baffles, trays, or other internal components;

      C. Repair or replacement of droplet eliminator elements as needed;

      D. Repair or replacement of heat exchanger elements used to control the temperature of fluids entering or leaving the scrubber; and

      E. Adjustment of damper settings for consistency with the required air flow.

f. The owner or operator of an affected hydrochloric acid* storage vessel shall inspect each vessel semiannually to determine that the closed-vent system and either the air pollution control device or the enclosed loading and unloading line, whichever is applicable, are installed and operating when required [40 CFR 63.1162(c)].

   * See also Condition 7.8.9(g)

g. Notwithstanding the requirements of 40 CFR 63, Subpart CCC, the Permittee shall:

   i. Record monitored operating data for each scrubber at least twice per shift and initiate corrective action for the scrubber if any recorded data indicates an operating problem with a scrubber;

   ii. Inspect the affected HCL storage vessels on at least a quarterly basis to confirm compliance.

h. Testing for VOM content of coatings shall be performed as follows [35 IAC 219.105(a) and 219.211(a) and Section 39.5(7)(b) of the Act]:

   i. Upon written request by the Illinois EPA, the VOM content of specific coatings used by the coating operations shall be determined according to USEPA Reference Method 24 of 40 CFR 60 Appendix A and the procedures of 35 IAC 219.105(a) and 219.211(a); or

   ii. This testing may be performed by the supplier of a material provided that the supplier provides appropriate documentation for such testing to the Permittee and the Permittee's records directly reflect the application of such materials.

i. Pursuant to Sections 39.5(7)(a) and (d) of the Act, the Permittee shall measure or monitor the pressure differential and scrubbant flow rate on the fume scrubbers controlling the cleaner sections on Galvanizing Lines #7A and #8, as follows:

   i. The pressure differential shall be determined in inches of water column.

   ii. Scrubbant flow rate shall be determined in gallons per minute (gpm).

   iii. Pressure differential and scrubbant flow rate shall be recorded at least once per shift if data is not automatically recorded.

j. Pursuant to Sections 39.5(7)(a) and (d) of the Act, the Permittee shall operate instrumentation for the #8 Galvanizing Furnace for the NO_x concentration (ppm) in the flue gas exhaust stream and the inlet temperature (°C or °F) of the associated NO_x catalytic converter, as follows:

   i. NO_x concentration (ppm) and inlet temperature shall be recorded at least once per shift if hourly average data is not automatically recorded.

ii. The Permittee shall follow manufacturer's procedures for the operation and maintenance of the NO_x instrumentation.

7.8.10 Recordkeeping Requirements

The Permittee shall maintain records of the following items for the affected finishing operations, pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. Recordkeeping required for the pickling line by the NESHAP:

i. The "general records" required by the NESHAP, as required by 40 CFR 63.10(b)(2) and 63.1165.

ii. Records of the following, as required by 40 CFR 63.1165(b), which records shall be retained for 5 years from the date of each record:

A. Scrubber makeup water flow rate and recirculation water flow rate if a wet scrubber is used;

B. Calibration and manufacturer certification that monitoring devices are accurate to within 5 percent; and

C. Each maintenance inspection and repair, replacement, or other corrective action.

iii. The Permittee shall keep the written operation and maintenance plan on record after it is developed to be made available for inspection, upon request, by the Illinois EPA for the life of the affected source or until the source is no longer subject to the provisions of 40 CFR 63 Subpart CCC. In addition, if the operation and maintenance plan is revised, the Permittee shall keep the previous (i.e., superseded) versions of the plan on record to be made available for inspection by the Illinois EPA for a period of 5 years after each revision to the plan.

iv. If the Permittee operates under manufacturer's specifications or manufacturer's instructions, such manufacturer's documentation shall be kept at the source as part of the required records.

b. Recordkeeping requirements for galvanizing lines:

Pursuant to Sections 39.5(7)(a) and (f) of the Act, the Permittee shall keep the following records for the various emission units on the galvanizing lines:

i. The following records related to the tune-ups conducted on furnaces and process heaters on the lines pursuant to 40 CFR 63.7540(a)(10):

A. Records for each tune-up that include the following: Date and time tune-up was conducted and responsible person; Identification of the unit; Summary of inspections performed and required maintenance; Results of all calibrations performed; and CO concentrations in ppmv in the effluent stream and oxygen in volume percent, before and after the adjustments are made.

B. A copy of the manufacturers specifications for burners used for optimization of emissions and flame pattern during tune-ups.

ii. Records for emission tests, opacity observations, engineering calculations and other compliance determinations conducted for units to verify compliance with applicable standards, limitations and other requirements in Conditions 7.8.3, 7.8.6 and 7.8.7.

iii. Pursuant to 40 CFR 63.7555(h), if the Permittee uses an alternative fuel other than natural gas during a period of natural gas curtailment or supply interruption, the Permittee must keep records of the total hours per calendar year that alternative fuel is burned.

c. Recordkeeping for Galvanizing Line #8:

i. The following design and operating records for Galvanizing Line #8:

A. A file containing the rated heat input capacity of the furnace and each other fuel burning unit (mmBtu/hour), with supporting documentation.

B. Records of monthly and annual natural gas usage (mmscf/mo and mmscf/yr) for the furnace and other fuel burning units on the line.

ii. For the melting kettle, the following records:

A. Records of production (tons of product per month and year).

B. A file containing the emission factor used by the Permittee to calculate PM emissions from the kettle, with supporting documentation, which file shall be reviewed and updated if needed when new emission data become available

to assure that the factor does not understate actual PM emissions.

C. Records for actual PM emissions (lbs/month and tons/year), with supporting calculations.

iii. For the furnace and associated catalytic converter, the following records:

A. Engineering calculations for typical and maximum hourly NO_x emissions before and after control by catalytic converter (lbs/hour), with supporting documentation for the controlled emission rate from the furnace.

B. The normal range of operating parameters (inlet temperature and NO_x concentration in the exhaust stream) for the catalytic converter.

C. An operating log or other records for the catalytic converter that include information confirming proper operation on a daily basis and provide detailed information for any upset of the catalytic converter.

D. An inspection and maintenance log or other records for the catalytic converter that identify activities performed, with date, description and the responsible individual(s).

E. Usage or purchases of reagent for the catalytic converter (pounds/year).

F. Records for actual NO_x emissions of the furnace (tons/year), with supporting calculations.

G. A file containing the emission factors used by the Permittee to calculate emissions of PM/PM_{10}, CO, VOM and SO_2 from the furnace, with supporting documentation, and either engineering calculations for the maximum annual emissions of these pollutants (tons/year) or records of actual emissions of these pollutants (tons/year) to verify compliance with applicable limits.

iv. For the various emission units that combust fuel on the line, the following records:

A. A file containing engineering calculations for the maximum hourly emissions of NO_x (lbs/hour) from each unit or group of units, with supporting documentation.

B. A file containing the emission factors used by the Permittee to calculate emissions from these units, with supporting documentation, and either engineering calculations for the maximum annual emissions of NO_x and other pollutants (tons/year) from each unit or group of units or records of actual emissions(tons/year) to verify compliance with applicable limits.

v. For the cleaner section, the following records:

A. Engineering calculations for typical and maximum hourly PM emissions before and after control by the scrubber (lbs/hour), with supporting documentation for the controlled emission rate from the unit.

B. The normal range of operating parameters of the scrubber.

C. An operating log or other records for the scrubber that include information confirming proper operation on a daily basis and provide detailed information for any upset of the scrubber.

D. An inspection and maintenance log or other records for the scrubber that identify activities performed, with date, description and the responsible individual(s).

E. Records for actual PM emissions (tons/year), with supporting calculations.

vi. A. The records required by Conditions 7.8.10(c)(ii)(B), (c)(iii)(G) and (c)(iv)(B) shall be prepared and copies sent to the Illinois EPA in accordance with Condition 5.9.6(c).

B. Copies of the initial records required by Conditions 7.8.10(c)(iii)(A), (c)(iv)(A) and (c)(v)(A) shall be sent to the Illinois EPA within 45 days of the effective date of these conditions. Copies of revisions to these conditions shall be sent to the Illinois EPA in accordance with Condition 5.9.6(c)(ii).

d. Recordkeeping for the coating operations:

i. Records for coating usage (gal/mo and gal/yr, by coating or category of coating).

ii. Records of the VOM content of each coating or category of coating as applied (pounds/gallon, less exempt compounds), with supporting documentation.

iii. Records for testing or analysis conducted for the VOM content of coatings (pounds/gallon, less exempt compounds) that include identification of the tested coating(s), the results of the analysis, documentation for the analysis methodology, and identification of the person or party that performed the analysis.

7.8.11 Reporting Requirements

a. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations by the affected finishing operations from applicable requirements unless a NESHAP standard specifies a different time frame, as follows:

A. Requirements in Condition 7.8.3(b) through (e).

B. Requirements in Condition 7.8.5-1.

C. Requirements in Condition 7.8.6.

D. Requirements in Condition 7.8.7.

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

iii. The Permittee shall notify the Illinois EPA of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

iv. All deviation reports required by Condition 7.8.11(a) above shall contain the following:

A. Date, time and duration of the deviation;

B. Description of the deviation;

C. Probable cause of the deviation; and

D. Any corrective action or preventive measures taken.

b. The Permittee shall comply with the reporting requirements of 40 CFR 63.1164, including the following:

i. Reporting results of performance tests. As required by 40 CFR 63.10(d)(2), the owner or operator of an affected source shall report the results of any

performance test as part of the notification of compliance status required in 40 CFR 63.1163.

ii. Progress reports. The owner or operator of an affected source who is required to submit progress reports under 40 CFR 63.6(i) shall submit such reports to the Administrator (or the State with an approved permit program) by the dates specified in the written extension of compliance.

iii. Periodic startup, shutdown, and malfunction reports. Pursuant to 40 CFR 63.6(e), the owner or operator of an affected source shall operate and maintain each affected emission source, including associated air pollution control equipment, in a manner consistent with good air pollution control practices for minimizing emissions at least to the level required by the standard at all times, including during any period of startup, shutdown, or malfunction. Malfunctions must be corrected as soon as practicable after their occurrence.

A. Plan. As required by 40 CFR 63.6(e)(3), the owner or operator shall develop a written startup, shutdown, and malfunction plan that describes, in detail, procedures for operating and maintaining the source during periods of startup, shutdown, or malfunction, and a program of corrective action for malfunctioning process and air pollution control equipment used to comply with the relevant standards.

B. Reports. As required by 40 CFR 63.10(d)(5)(i), if actions taken by an owner or operator during a startup, shutdown, or malfunction of an affected source (including actions taken to correct a malfunction) are consistent with the procedures specified in the startup, shutdown, and malfunction plan, the owner or operator shall state such information in a semiannual report. The report, to be certified by the owner or operator or other responsible official, shall be submitted semiannually and delivered or postmarked by the 30th day following the end of each calendar half.

C. Immediate Reports. Any time an action taken by an owner or operator during a startup, shutdown, or malfunction (including actions taken to correct a malfunction) is not consistent with the procedures in the startup, shutdown, and malfunction plan, the owner or operator shall comply with all requirements of 40 CFR 63.10(d)(5)(ii).

c. Pursuant to 35 IAC 219.211(c)(3), for the affected coating operations, the Permittee shall notify the Illinois EPA in the following instances:

i. Any record showing violation of 35 IAC 219.204 shall be reported by sending a copy of such record to the Illinois EPA within 30 days following the occurrence of the violation.

ii. At least 30 calendar days before changing the method of compliance from 35 IAC 219.204 to 35 IAC 219.205 or 219.207, the Permittee shall comply with all requirements of 35 IAC 219.211(d)(1) or (e)(1), respectively. Upon changing the method of compliance from 35 IAC 219.204 to 35 IAC 219.205 or 219.207, the Permittee shall comply with all requirements of 35 IAC 219.204(d) or (e), respectively.

d. i. If the Permittee operates a unit using a fuel other than natural gas, to fire the affected unit during a period of natural gas curtailment or supply interruption, as defined in 40 CFR 63.7575, the Permittee must submit a notification of alternative fuel use within 48 hours of the declaration of each period of natural gas curtailment or supply interruption. The notification must include the information specified in 40 CFR 63.7545(f)(1) through (f)(5) [40 CFR 63.7545(f)].

ii. If the Permittee intends to use fuel other than natural gas and other than during a period of natural gas curtailment or supply interruption as addressed by 40 CFR 63.7545(f), the Permittee must provide 30 days prior notice of the date upon which the fuels will be switched [40 CFR 63.7545(h)].

7.8.12 Operational Flexibility/Anticipated Operating Scenarios

Operational flexibility is not set for the affected finishing operations.

7.8.13 Compliance Procedures

For affected finishing operations, compliance with the applicable standards, limitations and requirements of Conditions 7.8.3, 7.8.5 and 7.8.7 is addressed by the work practices, testing, monitoring, recordkeeping and reporting requirements in Section 7.8 of this permit.

7.8.14 State-Only Conditions

Pursuant to 35 IAC 217.150, 217.152, and 217.160, by the applicable compliance date for 35 IAC Part 217 Subparts D and I, the Permittee shall comply with applicable requirements of these rules for the affected galvanizing furnaces, including:

a. Certifying to the Illinois EPA that each affected galvanizing furnaces will be in compliance with the applicable emission limitation(s) of 35 IAC 217.244(a) by the applicable compliance date.

b. Operation of each affected galvanizing furnaces in a manner consistent with good air pollution control practices to minimize NO_x emissions.

c. Compliance with the applicable NO_x emission limitation(s) in accordance with 35 IAC 217.154 or 217.157.

d. Compliance with the applicable monitoring, recordkeeping and reporting requirements in accordance with 35 IAC 217.157(b) and 217.156.

7.9 Wastewater Treatment Plant

7.9.1 Description

Primary Wastewater Treatment System:

The system is used to treat waste process water generated in both the iron and steelworks manufacturing areas in the facility. Emissions from this system are attributed to the blast furnace (BF) clarifiers, dust ponds, BF ditch, BF lagoon, steelworks ditch, steel works lagoon, and the wastewater treatment plant, itself. The ditches are used to transfer the BF and steelworks wastewater streams to the lagoons. The wastewater treatment plant is a simple system used to remove suspended solids and breakdown organic prior to discharge.

By-Products Wastewater Treatment System:

The system is used to treat waste process water generated in the coke oven by-product plant. Waste process water from the by-products plant is piped to the by-products wastewater treatment plant. The water treated in this system is primarily made up of process wastewater used to cool the processes and equipment used in the by-products plant. The treatment process carried out consists of the use of biological activity to breakdown the organic materials contained in the waste stream.

Note: This narrative description is for informational purposes only and is not enforceable.

7.9.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
Wastewater Treatment	Equalization Tanks	N/R	None
	BFG Clarifiers		
	Aeration Basin Clarifiers		
	Lagoons		
	Sand Filters		

7.9.3 Applicable Provisions and Regulations

The “affected wastewater treatment system” for the purpose of these unit-specific conditions is the treatment systems described in Conditions 7.9.1 and 7.9.2.

7.9.4 Non-Applicability of Regulations of Concern

a. The affected wastewater treatment systems are not subject to the operating and control requirements of 40 CFR 61 Subpart FF in general and 40 CFR 61.344 or 40 CFR 61.343 in particular, as provided by 40 CFR 61.342(a). This determination is based on the amount of benzene waste

generated on site being less than 10 Mg/yr (11 ton/yr). If conditions at the facility change and the total annual benzene calculation increases to 10 Mg/yr or more, the facility will become subject to operating and control requirements of 40 CFR 61 Subpart FF and the Permittee must apply for a revision to this permit, which could affect applicable requirements for the affected wastewater treatment plant.

b. The affected wastewater treatment system is not subject to 40 CFR Part 63, Subpart QQ, National Emission Standards for Surface Impoundments. This determination is based on the applicability criteria of 40 CFR 63.940, which provides that 40 CFR 63 Subpart QQ applies to impoundments when an applicable Subpart of Parts 40 CFR 60, 61 or 63 references the use of Subpart QQ for air emission control. However, applicable Subpart FF does not reference to 40 CFR 63 Subpart QQ.

c. This permit is issued based on the affected wastewater treatment system not being subject to the applicable requirements of 35 IAC 219.301 because the affected plant does not emit photochemically reactive organic material as defined in 35 IAC 211.4690.

7.9.5 Control Requirements and Work Practices

Control requirements and work practices are not set for the affected wastewater treatment systems.

7.9.6 Production and Emission Limitations

The production and emission limits are not set for the affected wastewater treatment systems.

7.9.7 Testing Requirements

Testing requirements are not set for the affected wastewater treatment systems.

7.9.8 Monitoring Requirements

If operation(s) at the facility change, the Permittee shall evaluate whether the change affects the wastewater treatment systems such that it become subject to the requirements of 35 IAC 219.301 and must apply for a revision of this permit.

7.9.9 Recordkeeping Requirements

No recordkeeping requirements are established at this time.

7.9.10 Reporting Requirements

a. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days if the following occurs:

i. The affected wastewater treatment systems become subject to the control requirements of 40 CFR 61 Subpart FF;

ii. The affected wastewater treatment system become subject to 35 IAC 219.301.

b. The notifications described in Condition 7.9.10 above shall contain the following:

i. Date of applicability;

ii. Emission units(s)/operation involved; and

iii. Method by which compliance would be demonstrated.

7.9.11 Operational Flexibility/Anticipated Operating Scenarios

Operational flexibility is not set for the affected wastewater treatment systems.

7.9.12 Compliance Procedures

Compliance procedures are not set for the affected wastewater treatment systems.

7.9.13 State-Only Conditions

State-only conditions are not established.

7.10 Boilers

7.10.1 Description

Boilers 11 and 12 are located in Boiler House 2 and are rated at 225 mmBtu/hour each. Each of these boilers are physically capable of combusting various combinations of natural gas, coke oven gas (COG) and blast furnace gas (BFG). The Permittee has a construction permit to install Flue Gas Recirculation on these boilers for control of NO_x emissions (Construction Permit 10080022).

The Permittee completed construction of a new boiler pursuant to Construction Permit 06070023. The new boiler (Power Boiler #1) is used for cogeneration, producing both electricity and process steam as it supplies high pressure steam which is sent to a steam turbine that generates electricity for use at the source. Low-pressure steam from this turbine is used for manufacturing operations at the source.

BFG is a primary fuel for this boiler. Natural gas would be used for the pilot flame and also for combustion control.

A cooling tower operates in conjunction with the new boiler and associated steam turbine.

Portable boilers not yet constructed.

Note: This narrative description is for informational purposes only and is not enforceable.

7.10.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
Boilers	Boiler House 2 Boiler 11 & 12 – 225 mmBtu/Hr each	Pre-1973	Flue Gas Recirculation (planned)
	Power Boiler #1 (nominal capacity 505 mmBtu/hour)	2009	None
Portable Boilers	Portable Boilers #1 through #4 (planned)	Planned	Low NO_x burners and Flue Gas Recirculation (planned)
Cooling Tower	Cooling Tower associated with Power Boiler #1	2009	None

7.10.3 Applicable Provisions and Regulations

a. i. The “affected boilers” for the purpose of these unit-specific conditions, are Boiler #11 and #12 and Power

Boiler #1 as described in Conditions 7.10.1 and 7.10.2.

ii. The “affected cooling tower” for the purpose of these unit-specific conditions is the unit described in Conditions 7.10.1 and 7.10.2.

b. i. Affected Boilers #11 and #12 may be subject to 40 CFR Part 63, Subpart DDDDD, NESHAP for Industrial, Commercial, and Institutional Boilers and Process Heaters. For these boilers, pursuant to 40 CFE 63.7540(a), unless an affected boiler is operating as a blast furnace gas fuel-fired boiler, as defined in 40 CFR 63.7575, or is otherwise not subject to this NESHAP, beginning on the compliance date of this NESHAP for existing sources, the Permittee shall comply with each applicable emission limit, operating limit, and work practice standard in Table 2 of this NESHAP according to the methods specified in Table 8 to this NESHAP and relevant provisions in 40 CFR 63.7540(a)(1) through (11), as applicable.

ii. In particular, if affected Boiler #11 or #12 is in the Gas 2 subcategory (other gaseous fuel) pursuant to 40 CFR 63.7499, the Permittee shall comply with the following emission limits beginning on the applicable compliance date of 40 CFR 63 Subpart DDDDD, pursuant to 40 CFR 63.7500(a)(1) and Table 2 of this NESHAP:

A. Particulate Matter (PM) emissions shall not exceed 0.043 lb per mmBtu of heat input or 0.026 lb per mmBtu of steam output (3-run average).

B. Hydrogen Chloride (HCl) emissions shall not exceed 0.0017 lb per mmBtu of heat input or 0.001 lb per mmBtu of steam output.

C. Mercury (Hg) emissions shall not exceed 1.3E-05 lb per mmBtu of heat input or 7.8E-06 lb per mmBtu of steam output.*

D. CO emissions shall not exceed 9 ppm by volume on a dry basis corrected to 3 % oxygen or 0.005 lb per mmBtu of steam output.

E. Dioxin/Furans (D/F) emissions shall not exceed 0.08 ng/dscm (TEQ) corrected to 7% oxygen or 3.9E-11 (TEQ) lb per mmBtu of steam output.*

* 1.3E-05 = 0.00013
7.8E-06 = 0.0000078
3.9E-11 = 0.000000000039

c. Affected Boilers #11 and #12 shall not exceed the PM_{10} limitation of 35 IAC 212.458(b)(9):

32.25 ng/J (0.075 lbs/mmBtu) of heat input from the burning of COG.

d. The affected Power Boiler #1 is subject to the NSPS for Industrial-Commercial-Institutional Steam Generating Units, 40 CFR 60 Subpart Db. (See relevant recordkeeping requirements in Condition 7.10.9.)

e. For affected boilers #11 and #12, pursuant to 35 IAC 214.421, no person shall cause or allow the emission of sulfur dioxide into the atmosphere in any one hour period from any existing fuel combustion emission source at a steel mill located in the Chicago or St. Louis (Illinois) major metropolitan area burning any solid, liquid or gaseous fuel, or any combination thereof, to exceed the allowable emission rate determined by the following equation:

$$E = S_S H_S + S_d H_d + S_R H_R + S_G H_G$$

i. Symbols in the equation mean the following:

E = allowable sulfur dioxide emission rate;

S_S = solid fuel sulfur dioxide emission standard which is applicable;

S_d = distillate oil sulfur dioxide emission standard determined from the table in 35 IAC 214.421(d) and equal to 0.46 kg/MW-hr (0.03 lb/mmBtu);

S_R = residual oil sulfur dioxide emission standard which is applicable;

S_G = maximum by-product gas sulfur dioxide emissions which would result if the applicable by-product gas which was burned had been burned alone at any time during the 12 months preceding the latest operation, on or before March 28, 1983, of an emission source using any by-product gas;

H_S = actual heat input from solid fuel;

H_d = actual heat input from distillate fuel oil;

H_R = actual heat input from residual fuel oil;

H_G = actual heat input from by-product gases, such as those produced from a blast furnace.

ii. Metric or English units may be used in the equation as follows:

Parameter	Metric	English
E	kg/hr	lbs/hr
S_S, S_R, S_G	kg/MW-hr	lbs/mmBtu
S_d	0.46 kg/MW-hr	0.3 lbs/mmBtu
H_S, H_d, H_R, H_G	MW	mmBtu/hr

f. The affected boilers are subject to 35 IAC 216.121 which provides that no person shall cause or allow the emission of carbon monoxide into the atmosphere from a fuel combustion emission unit to exceed 200 ppm, corrected to 50 percent excess air [35 IAC 216.121].

g. The affected power boiler #1 is subject to 35 IAC 212.122(a), which provides that no person shall cause or allow the emission of smoke or other particulate matter into the atmosphere from any fuel combustion emission unit for which construction or modification commenced on or after April 14, 1972, with actual heat input greater than 73.2 MW (250 mmBtu/hr), having an opacity greater than 20 percent.

h. The affected boilers #11 and #12 are subject to 35 IAC 212.123(a), which provides that no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to 35 IAC 212.122.

i. Startup Provisions (All affected Boilers)

Pursuant to 35 IAC 201.149 and Part 201, Subpart I, subject to the following terms and conditions for affected Boilers #11, #12 and Power Boiler #1, the Permittee is authorized to violate the applicable opacity and carbon monoxide standards in 35 IAC 212.122(a), 212.123(a) and 216.121 (Conditions 7.10.3(g),(h) and (f)) during startup.

Note: This authorization is provided because the Permittee applied for such authorization in its CAAPP application, generally describing the efforts that will be used “…to minimize startup emissions, duration of individual starts, and frequency of startups.”

i. This authorization does not relieve the Permittee from the continuing obligation to demonstrate that all reasonable efforts are made to minimize startup emissions, duration of individual startups and frequency of startups.

ii. The Permittee shall conduct startup of the affected boilers in accordance with the manufacturer’s written instructions or other written procedures prepared by

the Permittee and maintained at the source (see Condition 7.10.9(d)(i)) for the affected boilers, that are specifically developed to minimize emissions from startups and that include, at a minimum a review of the operational condition of the affected boilers prior to initiating startup of the boiler.

iii. The Permittee shall fulfill applicable recordkeeping requirements of Condition 7.10.9(d).

iv. The Permittee shall fulfill applicable notification and reporting requirements of Condition 5.10.5-1.

v. As provided by 35 IAC 201.265, an authorization in a permit for excess emissions during startup does not shield a Permittee from enforcement for any violation of applicable emission standard(s) that occurs during startup and only constitutes a prima facie defense to such an enforcement action provided that the Permittee has fully complied with all terms and conditions connected with such authorization.

j. Malfunction or Breakdown Provisions (All affected Boilers)

Pursuant to 35 IAC 201.149 and Part 201, Subpart I, subject to the following terms and conditions, the Permittee is authorized to continue to operate affected boilers #11, #12 and Power Boiler #1 in excess of the applicable opacity and carbon monoxide standards in 35 IAC 212.122(a), 212.123(a) and 216.121 (Conditions 7.10.3(g),(h) and (f)) in the event of a malfunction or breakdown.

Note: This authorization is provided because the Permittee has applied for such authorization in its CAAPP application, generally explaining why such continued operation would be required to prevent injury to persons or severe damage to equipment, and describing the measures that will be taken to minimize emissions from any malfunctions and breakdowns.

i. This authorization only allows such continued operation as necessary to prevent injury to persons or severe damage to equipment and does not extend to continued operation solely for the economic benefit of the Permittee.

ii. Upon occurrence of excess emissions due to malfunction or breakdown, the Permittee shall as soon as practicable reduce boiler load, repair the affected boiler, remove the affected boiler from service or undertake other action so that excess emissions cease.

iii. The Permittee shall fulfill the applicable recordkeeping and reporting requirements of Condition

7.10.9(e) and Condition 5.10.5-2. For these purposes, time shall be measured from the start of a particular incident. The absence of excess emissions for a short period shall not be considered to end the incident if excess emissions resume.

iv. Following notification to the Illinois EPA (see Condition 5.10.5-2(a)(i)) of a malfunction or breakdown with excess emissions, the Permittee shall comply with all reasonable directives of the Illinois EPA with respect to such incident.

v. This authorization does not relieve the Permittee from the continuing obligation to minimize excess emissions during malfunction or breakdown. As provided by 35 IAC 201.265, an authorization in a permit for continued operation with excess emissions during malfunction and breakdown does not shield the Permittee from enforcement for any such violation and only constitutes a prima facie defense to such an enforcement action provided that the Permittee has fully complied with all terms and conditions connected with such authorization.

7.10.4 Non-Applicability of Regulations of Concern

a. The emission limitations of 35 IAC 212.324 are not applicable to any emission unit subject to a specific emissions standard or limitation contained in 35 IAC Part 212 Subpart R, pursuant to 35 IAC 212.324 (a)(3).

b. Affected Boilers #11 and #12 are not subject to 35 IAC 217.141 because the heat input capacity of each of these boilers is below the applicability threshold of this rule (250 mmBtu/hr).

c. Power Boiler #1

i. Affected power boiler #1 is not subject to the NSPS for Electric Utility Steam Generating Units (40 CFR 60, Subpart Da) because it is not an electric utility steam generating unit as the term is defined in 40 CFR 60.41Da.

ii. Affected power boiler #1 is not subject to 40 CFR 60, Subpart D because it is subject to the NSPS in 40 CFR 60 Subpart Db as it meets the applicability requirements under 40 CFR 60.40b(a) [40 CFR 60.40b(j)].

iii. Affected Power Boiler #1 is not subject to the SO_2 standards of 40 CFR 60, Subpart Db because it meets the exemption provided at 40 CFR 60.42b(k)(2) [See also Condition 7.10.5(b)].

iv. Affected Power Boiler #1 is not subject to the NO_x standards of 40 CFR 60, Subpart Db pursuant to 40 CFR 60.44b(c), because it has an annual capacity factor for natural gas of 10 percent or less and is subject to a federally enforceable requirement that limits operation to an annual capacity factor of 10 percent or less for natural gas [See Condition 7.10.6(a)(iii)].

v. Affected Power Boiler #1 is not subject to particulate matter standards under 40 CFR 60, Subpart Db because it does not fire solid or liquid fuels.

d. Affected Power Boiler #1 is not subject to 35 IAC 217.121 because it is not “fossil fuel-fired” as defined by 35 IAC 211.2425, i.e., a unit for which fossil fuels provide more than 50 percent of the annual heat input to the unit.

e. Pursuant to 40 CFR 63.7491(k), Power Boiler #1 is not subject to 40 CFR Part 63 Subpart DDDDD because this boiler is a blast furnace gas fuel-fired boiler as defined in 40 CFR 63.7575.

f. Cooling Tower:

i. The affected cooling tower is not subject to 35 IAC 219.986(d), because the cooling tower does not cool process water.

ii. The affected cooling tower is not subject to 40 CFR Part 63 Subpart Q because no chromium-based water treatment chemicals are used.

7.10.5 Control Requirements

a. Requirements for affected Power Boiler #1 from Permit 06070023

i. Emissions of PM and PM_{10} from the affected Power Boiler #1 shall be controlled by the existing BFG pretreatment system, which entails treatment by dust catchers and wet scrubbers [T1].

ii. BFG and natural gas shall be the only fuels fired in the affected Power Boiler #1 [T1].

iii. Affected Power Boiler #1 shall be operated for the primary purpose of supplying steam and electricity to the source with no more than 219,000 MW-hour of excess electricity sent to any utility power distribution system for sale in any calendar year from the electrical generator associated with the unit [T1].

b. Pursuant to 40 CFR 60.42b(k)(2), the sulfur content of the fuel fired in Power Boiler #1 shall not exceed 0.16 lb/mmBtu.

c. Requirements for affected Boilers #11 and #12

Only natural gas, coke oven gas and blast furnace gases are allowed to use as the fuels.

d. Requirements for affected Cooling Tower

Pursuant to 40 CFR 63.402, the Permittee shall not use chromium-based water treatment chemicals in the water cooling tower.

7.10.5-1 Work Practice Requirements

a. Pursuant to Sections 39.5(7)(a) and (d) of the Act, unless the Permittee conducts continuous emission monitoring for CO for an affected boiler, the Permittee shall conduct an annual tune-up for the boiler, as follows, to maintain compliance with 35 IAC 216.121. If annual tune-ups or combustion adjustments are required for an affected boiler pursuant to 40 CFR 63, Subpart DDDDD, these tune-ups shall also be conducted in accordance of applicable provisions of this NESHAP.

i. Each annual tune-up must be no more than 13 months after the previous tune-up. If the boiler is not operating on the required date for a tune-up, the tune-up must be conducted within one week of startup.

ii. Each tune-up shall consist of the following:

A. As applicable, inspect the burner, and clean or replace any components of the burner as necessary (the burner inspection may be delayed until the next scheduled unit shutdown, but each burner must be inspected at least once every 36 months);

B. Inspect the flame pattern, as applicable, and adjust the burner as necessary to optimize the flame pattern. The adjustment should be consistent with the manufacturer’s specifications, if available;

C. Inspect the system controlling the air-to-fuel ratio, as applicable, and ensure that it is correctly calibrated and functioning properly; and

D. Optimize total emissions of CO. This optimization should be consistent with the manufacturer's specifications, if available.

iii. Measure the concentrations in the effluent stream of CO in parts per million by volume (ppmv), and oxygen in volume percent, before and after the adjustments are made (measurements may be either on a dry or wet basis, as long as it is the same basis before and after the adjustments are made); and

iv. Submit a report to the Illinois EPA within 30 days of each tune-up that contains the following information:

A. The identity of the boiler, the date of the tune-up and the individual(s) who performed the tune-up and a summary of their experience with combustion tune-ups of boilers.

B. The concentrations of CO in the effluent stream in ppmv and oxygen in volume percent, measured before and after the adjustments of the boiler;

C. A description of any corrective actions taken as a part of the combustion adjustment; and

D. The type and amount of fuel used over the 12 months prior to the annual adjustment.

b. Pursuant to 40 CFR 63.7530(h), for an affected boiler that is subject to emission limits in 40 CFR 63 Subpart DDDDD, the Permittee must minimize the boiler's startup and shutdown periods following the manufacturer's recommended procedures, if available. If manufacturer's recommended procedures are not available, the Permittee must follow recommended procedures for a boiler of similar design for which manufacturer's recommended procedures are available.

7.10.6 Operational, Production and Emission Limitations

a. Limitations for affected Power Boiler #1 from Permit 06070023:

Note: Permit 06070023 includes certain limitations that apply to the combination of affected power boiler #1 and BFG flare #2, which is a new flare that was also constructed with the boiler. BFG flare #2 is generally addressed in Section 7.4 of this CAAPP permit.

i. The maximum design firing rate of affected Power Boiler #1 shall not exceed 505 mmBtu/hour [T1].

ii. The maximum design BFG input of affected Power Boiler #1 shall not exceed 476 mmBtu/hour [T1].

iii. Fuel usage for affected Power Boiler #1 and BFG flare #2 (see Section 7.4) shall not exceed the following limits (rolling 12-month basis) [T1]:

A. Natural gas: 341,666 mmBtu/year.

B. BFG and natural gas fuel usage combined: 4,511,426 mmBtu/year.

iv. Emissions of PM from affective Power Boiler #1, as measured by USEPA Method 5, shall not exceed 0.03 lb/mmBtu of exhaust [T1].

v. A. Emissions from affective Power Boiler #1 shall not exceed the following limits [T1]:

Pollutant	Mode	
	BFG* (Lbs/mmBtu)	Natural Gas (Lbs/mmBtu)
NO_x	0.05	0.12
CO	0.15	0.0824
VOM	---	0.0054
PM/PM_{10}	0.101	0.0075
SO_2	0.20	0.0006
Indiv. Metal HAP	0.00066	0.00066
Total HAPs	0.0053	0.0053

* BFG mode entails firing a mix of BFG with up to 10 percent natural gas.

B. Compliance with these limits shall be determined as a 3-hour average unless continuous emissions monitoring is conducted, in which compliance shall be determined as a daily average (24 operating hours).

C. Combined emissions from affected Power Boiler #1 and BFG flare #2 (see Section 7.4) shall not exceed the following limits [T1]:

Pollutant	Emissions	
	Tons/Month	Tons/Year
NO_x	12.5	124.74
CO	33.9	338.36
VOM	0.1	0.92
PM/PM_{10}	22.9	228.39
SO_2	45.2	451.14
Indiv. Metal HAP	0.2	1.5
Total HAPs	1.2	12.0

D. Compliance with annual limits in Condition 7.10.6(a) shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12

month total), unless otherwise specified in a particular condition.

b. Limits for the affected Cooling Tower from Permit 06070023 [T1]:

i. The total dissolved solids content of water circulating in the affected cooling tower shall not exceed 4,190 ppm on a monthly basis.

ii. Emissions of PM/PM_{10} from the affected cooling tower shall not exceed 0.39 tons/month and 3.86 tons/year. Compliance with the annual limit shall be determined from a running total of 12 months of data.

7.10.7-1 Current Testing Requirements

The Permittee shall conduct emission testing for the affected boilers as provided below pursuant to Sections 39.5(7)(c),(d) and (p) of the Act.

a. Requirements for affected Boilers #11 and #12:

i. PM and CO emissions shall be measured to determine compliance with 35 IAC 212.458(b)(9) (Condition 7.10.3(c)) and 35 IAC 216.121 (Condition 7.10.3(f)) in accordance with procedures in USEPA Methods 1 through 4 and Method 5 (or Method 201A), as provided in 35 IAC 212.108, and Method 10 or 10B.

ii. The testing shall be completed within 30 months of the effective date of this permit condition and may be done on either affected Boiler #11 or #12, as selected by the Illinois EPA.

iii. In addition to other required information, the test report shall include data for the sulfur and PM content of BFG and COG during the period of testing, with supporting data.

b. Requirements for affected Power Boiler #1:

i. Permittee shall conduct emission tests at least every five years on the affected Power Boiler #1.

ii. CO, NO_x, SO_2, PM_{10}, PM and VOM emissions shall be determined in accordance with the test methods identified below.

iii. These tests shall also include measurements of emissions of metals if the Permittee elects to conduct emissions testing to verify compliance with the limits for metal HAPs, as an alternative to applying data for the metal HAP content of material collected during pretreatment of the BFG.

iv. The following USEPA test methods shall be used for testing of emissions, unless another USEPA method is approved by the Illinois EPA.

Location of Sample Points	Method 1
Gas Flow and Velocity	Method 2
Flue Gas Weight	Method 3
Moisture	Method 4
SO_2	Method 6
PM/PM_{10} (filterable	Methods 201 or 201A*
PM (condensable)	Method 202
VOM	Method 18 or 25A
NO_x	Method 7E or 19
CO	Method 10 or 10B
Metals	Method 29

* The Permittee may also use Method 5 as an alternative to Method 201A, provided that the measured results shall be considered PM_{10}.

v. In addition to other required information, the test report shall include data for the sulfur and PM content of BFG and the metals content of the material removed from raw BFG by the pretreatment system during the period of testing, with supporting calculations.

c. For this emission testing, test notifications and reporting shall be done by the Permittee in accordance with Conditions 8.6.2 and 8.6.3 of this permit.

d. Observation of opacity shall be conducted during all emission tests of affected boilers in accordance with Method 9 and the results of these observations included in the reports for emission testing.

7.10.7-2 Additional Performance Testing Requirements (40 CFR Part 63, Subpart DDDDD)

a. Pursuant to 40 CFR 63.7505(c) and 63.7510, if affected Boiler #11 or #12 is subject to emission limits in 40 CFR 63 Subpart DDDDD, the Permittee must demonstrate compliance with all limits that are applicable using performance testing according to 40 CFR 63.7(a)(2) and 63.7520 and fuel analysis according to 40 CFR 63.7521, including a continuous emissions monitoring system (CEMS) where applicable, in a timely manner. The Permittee may demonstrate compliance with the applicable emission limit for hydrogen chloride or mercury using fuel analysis if the emission rate calculated according to 40 CFR 63.7530(c) is less than the applicable emission limit. Otherwise, the Permittee must demonstrate compliance for hydrogen chloride or mercury using performance testing.

i. Pursuant to 40 CFR 63.7545(d),the Permittee must submit a Notification of Intent to conduct a performance test at least 60 days before the performance test is scheduled to begin.

ii. Pursuant to 40 CFR 63.7510(a), performance tests shall be conducted according to 40 CFR 63.7520(a), (c), (d) and (e) and Table 5 to 40 CFR 63, Subpart DDDDD fuel analysis for each type of fuel burned in the boiler shall be conducted according to 40 CFR 63.7521(a),(b) and (e) and Table 6 to 40 CFR 63, Subpart DDDDD, and performance evaluations for the oxygen monitor shall be conducted according to 40 CFR 63.7525.

b. Pursuant to 40 CFR 63.7530(g), if the Permittee elects to demonstrate that the gaseous fuel fired in affected Boiler #11 or #12 meets the specifications of an “other gas 1 fuel” as defined in 40 CFR 63.7575, an initial fuel specification analyses according to 40 CFR 63.7521(f) through (i) must be conducted.

i. If the mercury and hydrogen sulfide constituents in the gaseous fuels will never exceed the specifications included in the definition, the Permittee shall include a signed certification with the Notification of Compliance Status that the initial fuel specification test meets the gas specifications outlined in the definition of other gas 1 fuels.

ii. Pursuant to 40 CFR 63.7540(c), if the Permittee elects to demonstrate that the unit meets the specifications for hydrogen sulfide and mercury for the other gas 1 subcategory and cannot submit a signed certification under 40 CFR 63.7545(g) because the constituents could exceed or vary above the specifications, the Permittee must conduct monthly fuel specification testing of the gaseous fuels, according to the procedures in 40 CFR 63.7521(f) through (i) and 40 CFR 63.7540(c) and maintain records of the results of the testing as outlined in 40 CFR 63.7555(g).

7.10.8-1 Current Monitoring Requirements

Pursuant to 39.5(7)(a) and (d) of the Act, all affected boilers and the cooling tower are subject to the following monitoring requirements:

a. Opacity Observations

The Permittee shall conduct opacity observations for each affected boiler semi-annually in accordance with 40 CFR Part 60, Appendix A, Method 9. The duration of these

observations shall be a minimum of 30 minutes for each boiler.

b. Cooling Tower

i. The Permittee shall sample and analyze the water being circulated in the affected cooling tower on at least a monthly basis for the total dissolved solids content.

ii. Upon written request by the Illinois EPA, the Permittee shall have the water circulating in the affected cooling tower sampled and analyzed for the presence of hexavalent chromium in accordance with the procedures of 40 CFR 63.404(a) and (b).

c. Analysis of BFG

i. The Permittee shall sample and analyze cleaned BFG after the pretreatment system for sulfur content (lb/scf and lb/mmBtu), using appropriate ASTM methods or other comparable methodology. These measurements shall be conducted on at least a quarterly basis. The records for this activity shall also include operating data for the blast furnaces and the BFG pretreatment system at the time of sampling.

ii. The Permittee shall sample and analyze the cleaned BFG after the pretreatment system for PM content (gr/scf and lbs/mmBtu) and the material collected by the BFG pretreatment system for HAP metal content (by weight, dry basis, for individual metals as addressed by Method 29) using appropriate ASTM methods or other comparable methodology. These measurements shall be conducted at least every two years. The records for this activity shall also include operating data for the blast furnaces and the BFG pretreatment system at the time of sampling.

7.10.8-2 Additional Monitoring Requirements (40 CFR Part 63 Subpart DDDDD)

Unless an affected boiler is operating as a blast furnace gas fuel-fired boiler, as defined in 40 CFR 63.7575, or is otherwise exempt, beginning on the compliance date of this NESHAP for existing sources, the Permittee must:

a. Install, operate, and maintain a continuous oxygen monitor according to the procedures in 40 CFR 63.7525 (a)(1) through (6) and 63.7535. The oxygen level shall be monitored at the outlet of the boilers [40 CFR 63.7525(a)].

b. Monitor the operating parameters identified in Items 7, 8 and 9 of Table 8 of 40 CFR 63 Subpart DDDDD [40 CFR 63.7540(a)].

c. Operation above the established maximum or below the established minimum operating limits shall constitute a deviation of established operating limits listed in Table 4 of 40 CFR 63 Subpart DDDDD except during performance tests conducted to determine compliance with the emission limits or to establish new operating limits. Operating limits must be confirmed or reestablished during performance tests [40 CFR 63.7540(a)(1)].

7.10.9 Recordkeeping Requirements

The Permittee shall maintain records of the following items, pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. Affected Power Boiler #1:

i. A file which contains supporting documentation which demonstrates the maximum design firing rate of the affected boiler (mmBtu/hour), the maximum design BFG input, and the manufacturer’s guarantees for the emission rates of the natural gas burners in the affected boiler.

ii. NSPS Data

A. The applicable recordkeeping required by the NSPS for startup, shutdown and malfunction, pursuant to 40 CFR 60.7(b).

B. Daily records of the fuel consumption, pursuant to 40 CFR 60.49b(d)(1).

iii. Fuel usage

A. Records for the amounts of fuel burned by type (mmBtu/month and mmBtu/year) for the affected boiler.

B. Records for the amounts of fuel burned for the affected boiler and the new BFG flare, combined, by type (mmBtu/month and mmBtu/year).

iv. Emissions

The Permittee shall keep the following records related to the emissions of affected Power Boiler #1 to verify compliance with the applicable limits in Condition 7.10.6(a):

A. A file containing the emission factors used by the Permittee to determine emissions of pollutants other than SO2 from the affected boiler and BFG Flare #2, with supporting documentation. These records shall be reviewed

and updated by the Permittee as necessary to assure that the emission factors that it uses to determine emissions of the affected boiler do not understate actual emissions. These records shall be prepared and copies sent to the Illinois EPA in accordance with Condition 5.9.6(c).

B. Records of emissions of NO_x, CO, VOM, PM/PM_{10}, SO_2 and HAPs (tons/month and tons/year) from this boiler, with supporting calculations.

C. Records of summation of emissions of NO_x, CO, VOM, PM/PM_{10}, SO_2 and HAPs from this boiler and BFG Flare #2 (tons/month and tons/year), with supporting calculations.

v. Records of the electricity from the generator associated with Power Boiler #1 sent to the grid for sale per calendar year (MW-hours).

b. Affected Cooling Tower:

i. The Permittee shall keep records of the water circulation capacity of the cooling tower (gallons/minute, hourly average), with supporting calculations.

ii. The Permittee shall keep records of emissions of PM/PM_{10} (tons/month and tons/year), with supporting calculations.

c. Affected Boilers #11 and #12:

i. The following operating information for each boiler:

Usage of each type of fuel (natural gas, COG and BFG gas), in million ft^3 per month and million ft^3 per year.

ii. The Permittee shall keep inspection, maintenance, and repair logs with dates and the nature of such activities for each boiler.

iii. A file containing the emission factors used by the Permittee to determine emissions of NO_x and CO from affected Boilers #11 and #12, with supporting documentation. These records shall be reviewed and updated by the Permittee as necessary to assure that the emission factors that it uses to determine NO_x and CO emissions of these boilers do not understate actual emissions.

d. Records for Startups of Affected Boilers, pursuant to Section 39.5(7)(b) of the Act

i. The Permittee shall maintain startup procedures for each affected boiler, as required by Condition 7.10.3(i)(ii).

ii. The Permittee shall maintain the following records for each startup of an affected boiler:

A. Date, time and duration of the startup.

B. A description of the startup and reason(s) for the startup.

C. Whether a violation of an applicable standard may have occurred during startup accompanied by the information in Condition 7.10.9(d)(iv) if a violation may have or did occur.

D. Whether the established startup procedures, maintained above, were followed accompanied by the information in Condition 7.10.9(d)(iii) if there were departure(s) from those procedures.

iii. If the established startup procedures were not followed during a startup, the Permittee shall maintain the following records:

A. A description of the departure(s) from the established procedures.

B. The reason(s) for the departure(s) from the established procedures.

C. An explanation of the consequences of the departure(s) for emissions, such as whether the departure(s) prolonged the startup or resulted in additional emissions, and if so:

1. The actions taken to minimize emissions and the duration of the startup; and

2. An explanation whether similar incidents might be prevented in the future and if so, the corrective actions taken or to be taken to prevent similar incidents.

iv. If a violation did or may have occurred during a startup, the Permittee shall maintain the following records:

A. Identification of the applicable standard(s) that were or may have been violated.

B. An explanation of the nature of such violation(s), including the magnitude of such excess emissions.

C. A description of the actions taken or to be taken to minimize the magnitude of emissions and duration of the startup.

D. An explanation whether similar incidents could be prevented or ameliorated in the future and if so, a description of the actions taken or to be taken to prevent similar incidents in the future.

e. Records for Malfunctions or Breakdowns

Pursuant to 35 IAC 201.263, the Permittee shall maintain records of continued operation of the affected boilers as addressed by Condition 7.10.3(j), during malfunctions or breakdowns, which at a minimum, shall include the following records. The preparation of these records shall be completed within 45 days of an incident, unless the Permittee conducts a root cause analysis for the incident, in which case the preparation of these records, other than the root cause analysis, shall be completed within 120 days of the incident.

i. Date, time and duration of the incident.

ii. A detailed description of the incident, including:

A. A chronology of significant events during and leading up to the incident.

B. Relevant operating data for the unit, including information such as operator log entries and directives provided by management during the incident.

C. The measures taken to reduce the quantity of emissions and the duration of the incident including the resources utilized to address the incident.

D. The magnitude of emissions during the incident.

iii. An explanation why continued operation of an affected boiler was necessary to prevent personnel injury or prevent equipment damage.

iv. A discussion of the cause(s) or probable cause(s) of the incident including the following:

A. Whether the incident was sudden, unavoidable, or preventable, including:

1. Why the equipment design did not prevent the incident;

2. Why better maintenance could not have avoided the incident;

3. Why better operating practices could not have avoided the incident; and

4. Why there was no advance indication for the incident.

B. Whether the incident stemmed from any activity or event that could have been foreseen, avoided or planned for.

C. Whether the incident was or is part of a recurring pattern indicative of inadequate design, operation or maintenance.

v. A description of any steps taken or to be taken to prevent similar future incidents or reduce their frequency and severity.

vi. As an alternative to keeping the records required by Condition 7.10.9(e)(iv), the Permittee may perform a root cause analysis. For this purpose, a root cause analysis is an analysis whose purpose is to determine, correct and eliminate the primary causes of the incident and the excess emissions resulting there from. If the Permittee performs a root cause analysis method that would define the problem, define all causal relationships, provide a causal path to the root cause, delineate the evidence, and provide solutions to prevent a recurrence. Such an analysis shall be completed within one year of the incident.

f. Records for the emission testing conducted on the affected boilers.

g. If the Permittee operates under manufacturer’s specifications or manufacturer’s instructions, such manufacturer’s documentation shall be kept at the source as part of the required records.

h. Unless an affected boiler is operating as a blast furnace gas fuel-fired boiler, as defined in 40 CFR 63.7575, or is otherwise exempt, beginning on the compliance date of this NESHAP for existing sources, the Permittee must keep records in accordance with 40 CFR 63.7555(a) through (h) as applicable.

7.10.10 Reporting Requirements

a. i. The Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations of the affected boilers and affected cooling tower from the following applicable requirements unless a NESHAP standard specifies a different time frame, pursuant to Section 39.5(7)(f)(ii) of the Act:

A. Requirements in Condition 7.10.3(b), (d) and (e) through (h).

B. Requirements in Condition 7.10.5.

C. Requirements in Condition 7.10.6.

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

b. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

c. All deviation reports described in Condition 7.10.10(a) and (b) above shall contain the following:

i. Date, time and duration of the deviation;

ii. Description of the deviation;

iii. Probable cause of the deviation; and

iv. Any corrective actions or preventive measures taken.

d. Reporting on the State malfunction and breakdown authorization shall be performed in accordance with Condition 5.10.5-2.

e. For affected Power Boiler #1, the Permittee shall comply with the applicable reporting requirements of the NSPS, as specified in 40 CFR 60.7 and 60.49b.

f. Unless an affected boiler is operating as a blast furnace gas fuel-fired boiler, as defined in 40 CFR 63.7575, or is otherwise exempt, beginning on the compliance date of this NESHAP for existing sources, the Permittee must report each instance in which it did not meet each emission limit and operating limit in Tables 1 through 4 to 40 CFR 63 Subpart DDDDD that are applicable. These instances are deviations from the established emission limits. These deviations must be reported according to the requirements in 40 CFR 63.7550.

g. Reporting on the State startup authorization shall be performed in accordance with Condition 5.10.5-1.

h. Reporting on the Federal SSM authorization shall be performed in accordance with Condition 5.10.5-3.

7.10.11 Compliance Procedures

For affected boilers, compliance with the applicable standards of Condition 7.10.3, the work practice requirements of Condition 7.10.5-1, and the production/operating and the emission limits of Condition 7.10.6 is addressed by the work practices, testing, monitoring, recordkeeping and reporting requirements in Section 7.10 of this permit.

7.10.12 State-Only Conditions

a. Applicable requirements for affected Boilers #11 and #12 from Permit 10080022:

i. Pursuant to 35 IAC 217.150, 217.152, and 217.160, by the applicable compliance date for 35 IAC Part 217 Subparts D and E, the Permittee shall comply with applicable requirements of these rules for the affected boilers, including:

A. Compliance with the applicable NO_x emissions limitation in lb/mmBtu, calculated in accordance with 35 IAC 217.164(b), on an ozone season (May 1 through September 30) and annual basis [35 IAC 217.164(b)].

B. Operation of each affected boiler in a manner consistent with good air pollution control practices to minimize NO_x emissions [35 IAC 217.150(e)].

C. Certifying to the Illinois EPA that the affected boilers will be in compliance with the applicable emissions limitation of 35 IAC 217.164 by the applicable compliance date [35 IAC 217.152 and 217.155(b)].

D. Installation, operation and maintenance of a Continuous Emissions Monitoring System (CEMS) on each affected boiler to measure emissions of NO_x, with accompanying recordkeeping and reporting for the operation and maintenance of each CEMS [35 IAC 217.157(a)(2) and 217.156(b)(9), (b)(10) and (j)].

ii. Recordkeeping Requirements [39.5(7)(e) of the Act]

Beginning on the compliance date of 35 IAC 217 Subparts D and E, the Permittee shall keep the following records for each Boiler #11 and #12:

A. Usage of each type of fuel (natural gas, coke oven gas and blast furnace gas), in million ft^3 per month and million ft^3 per year.

B. The actual heat input in mmBtu per ozone season and mmBtu per year, for each fuel, with supporting documentation for the heat content of each fuel.

C. The applicable NO_x emission limitation in lb/mmBtu for each ozone season and each calendar year, calculated in accordance with 35 IAC 217.164(b).

D. The average hourly NO_x emission data.

E. The ozone season and annual NO_x emissions (pounds).

F. The ozone season average and annual average NO_x emission rates (lbs/mmBtu heat input) calculated within 30 days of the end of the averaging periods (i.e. calculated by October 30 for ozone season averaging period and by January 30 for annual averaging period).

G. Inspection, maintenance, and repair logs with dates and the nature of such activities for each affected boiler.

iii. Reporting Requirements [39.5(7)(f) of the Act]

If there is any deviation of the requirements of Condition 7.10.12, the Permittee shall promptly report to the Illinois EPA as specified below and report shall include a description of the deviation, the probable cause of the deviation, corrective actions taken, and any preventive measures taken:

A. Deviations from the NO_x emission limitation in 35 IAC 217.164(b) shall be reported within 30 days of such occurrence.

B. Other deviations shall be reported in a semi-annual report.

7.10.13 Construction Permit Conditions for Equipment that is not yet built

Applicable requirements for portable Boilers #1 through #4 from Permit 10100042:

a. Pursuant to the NSPS, 40 CFR 60.11(d), at all times the Permittee shall, to the extent practicable, maintain and operate each portable boiler in a manner consistent with good air pollution control practices for minimizing emissions.

b. Pursuant to 35 IAC 216.121, the emission of carbon monoxide (CO) from each portable boiler shall not exceed 200 ppm, corrected to 50 percent excess air.

c. Pursuant to 35 IAC 212.123(a), the opacity of the exhaust from each portable boiler shall not exceed 30 percent, except as provided in 35 IAC 212.123(b).

d. This permit is issued based on the emissions of HAPs as listed in Section 112(b) of the Clean Air Act from the affected boilers being less than 10 tons per year of a single HAP and 25 tons per year of any combinations of such HAPs, so that these boilers are considered a minor source for HAPs.

e. This permit is issued based on the portable boilers not being subject to the control requirements of 35 IAC 217, Subparts D and E, which establish requirements that reflect Reasonably Available Control Technology (RACT) for boilers related to emission of nitrogen oxide (NO_x). This is because the NO_x emissions from each portable boiler are restricted to less than 15 tons per year and to less than 5 tons per ozone season, pursuant to 35 IAC 217.150(a), as addressed further.

f. Natural gas shall be the only fuel fired in the portable boilers.

g. The maximum design heat input capacity of each portable boiler, as defined by the NSPS, 40 CFR 60.41c, shall not exceed 100 mmBtu/hour.

Note: If a portable boiler were to have a heat input capacity of greater than 100 mmBtu/hr, it would be subject to the NSPS, 40 CFR 60 Subpart Db, rather than Subpart Dc.

h. i. The total consumption of natural gas by the portable boilers shall not exceed 1,738 million scf per year, combined.

ii. Beginning Calendar year 2012 or such later date, the natural gas usage by each portable boiler shall not exceed 812 million scf per year and 267 million scf

during each ozone season (May 1 through September 30).

i. The portable boilers shall only be used to address interruptions in the normal steam supply to the Granite City Works. For this purpose, the portable boilers and existing boilers may operate simultaneously, as may be needed to ensure availability of the portable boilers and facilitate transitions between existing boilers and the portable boilers.

j. i. Short-term emissions from each portable boiler shall not exceed 0.036 lb of NO_x/mmBtu and 3.6 and 3.8 lbs/hour, for NO_x and CO, respectively.

ii. Annual emissions from the portable boilers, combined shall not exceed the following limits. These limits are established based on total fuel usage of 1,738 million scf per year. Compliance with these limitations and the annual fuel consumption limit shall be determined from a running total of 12 months of data.

Pollutant	Emission Limit (ton/year)
NO_x	31.9
CO	33.2
VOM	3.5
$PM/PM_{10}/PM_{2.5}$	1.1
SO_2	1.3
Individual HAP[1]	1.8
Total HAP	3.5

[1] Individual HAP refers to individual pollutants, such as Formaldehyde, Benzene, Toluene, Hexane, etc.

k. Beginning Calendar Year 2012, the NO_X emissions of each portable boiler shall be less than the applicability thresholds of 35 IAC 217, Subparts D and E, i.e., less than 15 tons per year and less than 5 tons during each ozone season.

l. The Permittee shall operate and maintain the portable boilers in accordance with good air pollution control practices to assure proper functioning of equipment and minimize malfunctions, including maintaining the boiler in accordance with written procedures developed for this purpose.

m. Within 90 days after a written request from the Illinois EPA or such later date agreed to by the Illinois EPA, the Permittee shall have NO_X and CO emissions of portable

boiler(s), as specified in the request, measured by an independent testing service approved by the Illinois EPA.

n. The Permittee shall maintain the following records for the portable boilers:

i. A file containing the following information:

A. The maximum design heat input capacity of each portable boiler, mmBtu/hour, with supporting documentation.

B. The maximum fuel flow rate to each portable boiler, in scf/hour and mmBtu/hour, with supporting documentation.

C. The guarantee or other information for the NO_x and CO emission rates of each portable boiler, in lb/hour and in lb/mmBtu (NO_x only), with supporting documentation.

ii. An operating log or other records for the portable boilers that, at a minimum, shall include the following information:

A. Information identifying each period when portable boiler(s) are operated, with the explanation why the boiler(s) need to be operated to maintain the normal steam supply for the source.

B. If the maximum design heat input capacity of the portable boiler is more than 95 mmBtu/hour, operating records to demonstrate that the boiler is not fired at more than 100 mmBtu/hour.

C. Information for each startup and shutdown, including date, time and duration, as required by 40 CFR 60.7(b).

D. Information for any incident in which the operation of each portable boiler continued during malfunction or breakdown, as required by 40 CFR 60.7(b). These records shall include date, time, and duration; a description of the incident; whether emissions exceeded or may have exceeded any applicable standard; a description of the corrective actions taken to reduce emissions and the duration of the incident; and a description of the preventative actions taken.

iii. An inspection, maintenance, and repair log with dates and the nature of such activities for the portable boilers.

iv. The following records for the natural gas usage of the portable boilers:

A. Natural gas usage of each boiler, pursuant to 40 CFR 60.48c(g) (scf/month).

B. Total natural gas usage of the boilers (scf/year).

v. Records of the monthly and annual emissions of NO_x, CO, $PM/PM_{10}/PM_{2.5}$, VOM, SO_2, and HAPs from the boilers (tons/month and tons/year), with supporting data and calculations.

vi. Beginning Calendar year 2012, records of NO_x emissions for each portable boiler for the calendar year (ton/year) and for the ozone season (ton/season).

o. Pursuant to 40 CFR 60.7(a)(3) and 60.48c(a), the Permittee shall furnish the Illinois EPA with written notification of initial startup of each portable boiler. This notification shall be submitted within 15 days after the initial startup of the portable boiler, postmarked by such date, and include the following information. For this purpose, a separate notification shall be provided each time that portable boiler(s) are installed at the Granite City Works.

i. The design heat input capacity of the boiler and identification of the fuels to be combusted in the boiler, pursuant to 40 CFR 60.48c(a)(1).

ii. The annual capacity factor at which the Permittee anticipates operating the boiler based on fuel fired, pursuant to 40 CFR 60.48c(a)(3).

iii. With the notification required from above, the Permittee shall also provide the manufacturer and serial number of portable boiler(s).

p. The Permittee shall notify the Illinois EPA of deviations of the portable boilers with the requirements of Condition 7.10.13 within 30 days of an occurrence. Reports shall describe the deviation, the probable cause of such deviations, the corrective actions taken, and any preventive measures taken.

7.11 Internal Combustion Engine

7.11.1 Description

A diesel fuel fired emergency engine-generator is used for power outages at the facility.

Note: This narrative description is for informational purposes only and is not enforceable.

7.11.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
Engine	Emergency Engine-Generator (maximum power output 3,500 HP)	2001	None

7.11.3 Applicable Provisions and Regulations

a. The “affected engine” for the purpose of these unit-specific conditions, is the emission unit described in Conditions 7.11.1 and 7.11.2.

b. The affected engine is subject to 35 IAC 212.458(b)(7) and (c), which provides that its PM_{10} emissions shall not exceed 22.9 mg/scm (0.01 gr/scf), provided however that this limit shall not apply if there are no visible emissions, except if a stack test is performed. The absence of visible emissions is not a defense to a finding violation.

c. The affected engine is subject to 35 IAC 212.123(a), which provides that no person shall cause or allow the emission of smoke or other particulate matter, with an opacity greater than 30 percent, into the atmosphere from any emission unit other than those emission units subject to the requirements of 35 IAC 212.122, except as allowed by 35 IAC 212.123(b) and 212.124.

d. The affected engine is subject to 35 IAC 214.301 and 35 IAC 214.304/214.122, which provides that no person shall cause or allow the emission of sulfur dioxide into the atmosphere from any process emission source to exceed 2000 ppm and from any fuel burning process emission unit burning distillate oil to exceed 0.3 lbs/mmBtu.

7.11.4 Non-Applicability of Regulations of Concern

a. The affected engine is not subject to 40 CFR Part 63 Subpart ZZZZ because it is not a spark ignition engine.

b. The affected engine is not subject to 40 CFR Part 60 Subpart IIII, because the affected engine was manufactured before 2006 and was not modified or reconstructed

thereafter, so does not meet applicable criteria in 40 CFR 60.4200(a).

c. The affected engine is not subject to 35 IAC Part 217, because the affected engine is not a type of process emission unit addressed by Part 217.

d. The affected engine is not subject to the requirements of 35 IAC 212.321 because it does not have a process weight rate as defined in 35 IAC 211.5250.

e. The affected engine is not subject to 35 IAC 216.121, because the affected engine is not by definition a fuel combustion emission unit.

f. 35 IAC 212.324 is not applicable to the affected engine pursuant to 35 IAC 212.324(a)(3), because the affected engine is subject to 35 IAC 212.458(b)(7), an emission limitation in 35 IAC Part 212, Subpart R.

7.11.5 Control Requirements and Work Practices

The operation of the emergency generator is limited to 500 hours per year [00060003, T1].

7.11.6 Production and Emission Limitations from Permit 00060003 [T1]

a. Emissions of the affected engine shall not exceed the following limits:

Pollutant	Emissions (lbs/hr)	Emissions (T/yr)
PM	2.48*	0.62
CO	21.11*	5.3
NO_x	79.49*	19.9
SO_2	12.54	3.1

* Operation at a level of 10 percent higher than the applicable hourly emissions limits above is allowed during startup.

b. Compliance with annual limits shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total) [T1].

7.11.7 Testing Requirements

Upon the written request from the Illinois EPA, the emission tests shall be conducted by the Permittee for the affected engine to verify compliance with emission limits in Condition 7.11.6 as follows [Sections 39.5(7)(c), (d) and (p) of the Act].

a. The following USEPA test methods shall be used, unless another USEPA method is approved by the Illinois EPA.

Location of Sample Points	Method 1
Gas Flow and Velocity	Method 2
Flue Gas Weight	Method 3
Moisture	Method 4
PM	Method 5
NO_x	Method 7E or 19
CO	Method 10 or 10B

b. Observations of opacity shall be conducted during these emission tests in accordance with Method 9 and the results of these observations included in the reports for emission testing.

c. For this emission testing, test notifications and reporting shall be done by the Permittee in accordance with Conditions 8.6.2 and 8.6.3 of this permit.

7.11.8 Monitoring Requirements

a. The Permittee shall perform annual sampling and analysis for sulfur content (lbs/mmBtu) in the fuel for the affected engine or obtain a certification for each fuel supplied delivery for the affected engine [Section 39.5(7)(d) of the Act].

b. The Permittee shall conduct opacity observations for the affected engine in accordance with Method 9 on an annual basis if the affected engine starts for purposes of reliability testing. The duration of Method 9 test shall be equal to 30 minutes or the duration of the reliability test, whichever is less [Section 39.5(7)(p) of the Act].

7.11.9 Recordkeeping Requirements

The Permittee shall maintain records of the following items for the affected engine, pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. A file for the affected engine containing:

i. The manufacturer’s emission guarantees or emission data for the engine, for PM, CO and NO_x, both during normal operation and startup (lbs/hour and lbs/gallon) and manufacturer’s data for fuel consumption and exhaust flow rate from the engine, with supporting documentation.

ii. Engineering calculations to demonstrate that PM emissions comply with 35 IAC 212.458(b)(7) and to determine the greatest sulfur content (lbs/mmBtu) in fuel with which compliance with 35 IAC 214.301 and 35 IAC 214.304/214.122 would be shown.

iii. The emission rate(s) used by the Permittee to determine emissions of the affected engine when these rates are different from the manufacturer's rates, accompanied by supporting documentation. Copies of these records shall be submitted to the Illinois EPA, with initial records submitted within 15 days of the date that the records are prepared or 30 days after the effective date of this permit, whichever is later and subsequent revisions to these records submitted within 15 days of the date that the Permittee completes preparation of revised records.

b. Records of fuel consumption (gal/month and gal/year).

c. Records of hours of operation (hrs/yr).

d. Records for number of startups.

e. Records for the sulfur content (lbs/mmBtu) of fuel as determined by sampling and analyses of fuel or copies of supplier certifications for sulfur content of fuel and identification of any use of oil whose sulfur content exceeded the level for compliance, as determined pursuant to Condition 7.11.9(a)(ii).

f. Records of emissions of PM, CO, NO_x and SO_2 (tons/month and tons/year) from the engine with supporting calculations. For this purpose, PM, CO and NO_x emissions shall be calculated from fuel usage and number of startups and the manufacturer's emission guarantees for emission rates or such higher emission rate(s) that accurately reflect actual operation of the engine. SO_2 emissions shall be calculated from the sulfur content of the fuel and fuel usage, assuming complete conversion of sulfur to SO_2.

g. Records for stack tests and opacity observations.

7.11.10 Reporting Requirements

a. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations by the affected engine as follows:

A. Requirements in Condition 7.11.3(b), (c) and (d).

B. Requirements in Condition 7.11.5.

C. Requirements in Condition 7.11.6.

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

b. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

c. All deviation reports described in Condition 7.11.10 above shall contain the following:

i. Date, time and duration of the deviation;

ii. Description of the deviation;

iii. Probable cause of the deviation; and

iv. Any corrective action or preventive measures taken.

7.11.11 Operational Flexibility/Anticipated Operating Scenarios

Operational flexibility is not set for the affected engine.

7.11.12 Compliance Procedures

For the affected engine, compliance with the applicable standards of Condition 7.11.3, the control/work practice requirements of Condition 7.11.5, and the production/emission limits of Condition 7.11.6 is addressed by testing, monitoring, recordkeeping and reporting requirements in Section 7.11 of this permit.

7.11.13 State-Only Conditions

State-only conditions are not being established.

7.12 Gasoline Storage and Dispensing

7.12.1 Description

Gasoline storage and dispensing is conducted for the Permittee's fleet of gasoline fueled vehicles. There are several such stations at the facility, so that fleet vehicles do not have to travel on public roads to reach the fueling stations.

Note: This narrative description is for informational purposes only and is not enforceable.

7.12.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
Gasoline Storage	Four storage tanks located at: Storeroom (1,000 gallons capacity); Machine Shop (1,000 gallons capacity); Wastewater Facility (250 gallons capacity); Blast Furnace Facility(1,000 gallons capacity)	N/A	Control Practices: Submerged loading pipe (all tanks) and Stage I system (tanks with 1,000 gallons capacity)

7.12.3 Applicable Provisions and Regulations

a. The "affected gasoline storage tanks", for the purpose of these unit-specific conditions are the tanks described in Conditions 7.12.1 and 7.12.2 above.

b. The affected gasoline storage tank at the wastewater facility is subject to the following:

No person shall cause or allow the loading of any organic material into any stationary tank having a storage capacity of greater than 946 l (250 gal), unless such tank is equipped with a permanent submerged loading pipe [35 IAC 219.122(b)].

c. Pursuant to 35 IAC 219.583(c)(1), the affected gasoline storage tanks at the storeroom, machine shop and blast furnace facility are subject to the following requirements of 35 IAC 219.583(a): No person shall cause or allow the transfer of gasoline from any delivery vessel into any stationary storage tank at a gasoline dispensing facility unless:

i. The tank is equipped with a submerged loading pipe [35 IAC 219.583(a)(1)].

ii. The vapors displaced from the storage tank during filling are processed by a vapor control system [35 IAC 219.583(a)(2)].

iii. All tank vent pipes are equipped with pressure/vacuum relief valves that are designed and shall be set to resist a pressure of at least 3.5 inches water column and to resist a vacuum of no less than 6.0 inches water column [35 IAC 219.583(a)(3)].

d. Pursuant to 35 IAC 219.585(a), all the affected gasoline storage tanks are subject to the following: No person shall sell, offer for sale, dispense, supply, offer for supply, or transport for use in Illinois gasoline whose Reid vapor pressure exceeds the applicable limitations set forth below during the regulatory control periods, which shall be June 1 to September 15.

i. The Reid vapor pressure of gasoline, a measure of its volatility, shall not exceed 7.2 psi (9.68 kPa) during the regulatory control period [35 IAC 219.585(b)].

ii. The Reid vapor pressure of ethanol blend gasolines having at least nine percent (9%) but not more than ten percent (10%) ethyl alcohol by volume of the blended mixture, shall not exceed the limitations for gasoline set forth in Condition 7.12.2(d)(i) above by more than 1.0 psi (6.9 kPa) [35 IAC 219.585(c)].

7.12.4 Non-Applicability of Regulations of Concern

a. This permit is issued based on the affected gasoline storage tank not being subject to the NSPS for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquid Storage Vessels), 40 CFR Part 60, Subpart Kb, because each tank is less than 40 cubic meters (10,566 gallons).

b. This permit is issued based on the affected gasoline storage tanks not being subject to 35 IAC 219.121, because each affected tank is less than 40,000 gallons [35 IAC 219.121].

c. This permit is issued based on the affected gasoline storage tanks not being subject to 35 IAC 219.122(a), because each affected tank is less than 40,000 gallons [35 IAC 219.122].

d. The affected gasoline storage tanks are not subject to 35 IAC 219.301 because the affected gasoline storage tanks do not use organic material. In addition, the storage tanks are regulated by 35 IAC 219.122(b) and 35 IAC 219.583(c)(1).

e. The affected gasoline storage and dispensing operations are not part of a bulk gasoline plant (35 IAC 219.581) or bulk gasoline terminals (35 IAC 219.582) pursuant to relevant definitions in 35 IAC Part 211.

f. This permit is issued based on the gasoline storage and dispensing operations performed at wastewater facility not being subject to 35 IAC 219.583(a)(2) and (a)(3) pursuant to 35 IAC 219.583(b)(3), because the tank capacity is less than 575 gallons.

g. The affected gasoline storage tanks are not eligible for the exemption from the permitting in 35 IAC 219.583(e) because they are not located at retail dispensing operations, as defined at 35 IAC 211.5630.

7.12.5 Control Requirements and Work Practices

The affected gasoline storage tanks (other than the affected gasoline storage tank at the wastewater facility) are subject to the following control requirements and work practices:

a. Pursuant to 35 IAC 219.583(c), each owner of a gasoline dispensing operation shall:

i. Install all control systems and make all process modifications required by Condition 7.12.3(c) (see also 35 IAC 219.583(a)) [35 IAC 219.583(c)(1)];

ii. Provide instructions to the operator of the gasoline dispensing operation describing necessary maintenance operations and procedures for prompt notification of the owner in case of any malfunction of a vapor control system [35 IAC 219.583(c)(2)]; and

iii. Repair, replace or modify any worn out or malfunctioning component or element of design [35 IAC 219.583(c)(3)].

b. Pursuant to 35 IAC 219.583(d), each operator of a gasoline dispensing operation shall:

i. Maintain and operate each vapor control system in accordance with the owner’s instructions [35 IAC 219.583(d)(1)];

ii. Promptly notify the owner of any scheduled maintenance or malfunction requiring replacement or repair of a major component of a vapor control system [35 IAC 219.583(d)(2)];

iii. Maintain gauges, meters or other specified testing devices in proper working order [35 IAC 219.583(d)(3)]; and

iv. Pursuant to 35 IAC 219.583(d)(4), operate the vapor collection system and delivery vessel unloading points in a manner that prevents:

A. A reading equal to or greater than 100 percent of the lower explosive limit (LEL measured as propane) when tested in accordance with the procedure described in EPA 450/2-78-051 Appendix B [35 IAC 219.583(d)(4)(A)]; and

B. Avoidable leaks of liquid during the filling of storage tanks [35 IAC 214.583(d)(4)(B)].

v. Within 15 business days after discovery of the leak by the owner, operator, or the Agency, repair and retest a vapor collection system which exceeds the limits of Condition 7.12.5(iv) above [35 IAC 219.583(d)(5)].

c. Pursuant to 35 IAC 219.584(a), the Permittee shall ensure that each gasoline delivery vessel that comes on to the property to fill the affected gasoline storage tanks at the storeroom, machine shop, or blast furnace facility are complying with the following:

i. Shall have a vapor space connection that is equipped with fittings which are vapor tight;

ii. Shall have its hatches closed at all times during unloading operations, unless a top loading vapor recovery system is used;

iii. Shall not internally exceed a gauge pressure of 18 inches of water or a vacuum of 6 inches of water;

iv. Shall be designed and maintained to be vapor tight at all times during normal operations;

v. Shall not be refilled in Illinois at other than a bulk gasoline terminal that complies with the requirements of 35 IAC 219.582 or a bulk gasoline plant that complies with the requirements of 35 IAC 219.581(b).

vi. Shall have a sticker affixed to the tank adjacent to the tank manufacturer's data plate which contains the tester’s name, the tank identification number and the date of the test. The sticker shall be in a form prescribed by the Illinois EPA.

7.12.6 Production and Emission Limitations

Production and emission limitations are not set for the affected gasoline storage tanks.

7.12.7 Testing Requirements

a. Pursuant to 35 219.583(a)(4), the Permittee shall demonstrate compliance with the pressure/vacuum relief valves specifications of Condition 7.12.3(c)(iii) at a gasoline dispensing operation by measuring and recording the pressure indicated by a pressure/vacuum gauge at each tank vent pipe 30 days after installation of each pressure/vacuum relief valve, and at least annually thereafter. The test shall be performed on each tank vent pipe within two hours after product delivery into the respective storage tank. For manifold tank vent systems, observations at any point within the system shall be adequate.

b. The Permittee shall test the relief valves whenever there is a modification of an existing vapor control system [39.5(7)(d) and (p) of the Act].

7.12.8 Monitoring Requirements

The Permittee shall perform the following monitoring pursuant to Sections 39.5(7)(a) and (d) of the Act.

a. The Permittee shall perform semi-annual inspections of the gasoline storage and dispensing operations at the storeroom, machine shop and blast furnace while the tank is being filled.

   i. Retractors, hoses, breakaways, swivels

   ii. Adapters, vapor caps, rubber gaskets, and spill containment buckets

b. The Permittee shall perform an annual inspection of the gasoline storage tank at wastewater facility and dispensing operation to ensure that a submerged loading pipe is physically present and the condition of the pipe for integrity.

7.12.9 Recordkeeping Requirements

The Permittee shall maintain records of the following items for the affected gasoline storage tanks, pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. Records of the testing and repair of the vapor collection system and pressure/vacuum relief valves, pursuant to Condition 7.12.7.

b. Records of gasoline throughput (gallons per month and gallons per year).

c. For the affected gasoline storage tanks during the regulatory control period, the Permittee shall keep the following records:

i. Retain a copy of an invoice, bill of lading, or other documentation used in normal business practice stating that the Reid vapor pressure of the gasoline complies with the Reid vapor pressure standard as provided in 35 IAC 219.585(h)(1)(A);

ii. Maintain records on the Reid vapor pressure, quantity received and date of delivery of any gasoline or ethanol blends arriving at the gasoline operation [35 IAC 219.585(h)(2)].

d. Copies of the annual certification(s) from the supplier of gasoline that all the delivery vessels have been tested and are in compliance with the requirements of Condition 7.12.5(c).

e. A copy of operating and maintenance procedures and instructions for the tanks and vapor control systems.

f. Records for all inspections.

7.12.10 Reporting Requirements

a. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations by the affected gasoline storage tanks from applicable requirements, as follows:

A. Requirements in Condition 7.12.3(b) through (d).

B. Requirements in Condition 7.12.5(a) and (b).

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

b. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

c. All deviation reports described in Condition 7.12.10 above shall contain the following:

i. Date, time and duration of the deviation;

ii. Description of the deviation;

iii. Probable cause of the deviation; and

iv. Any corrective action or preventive measures taken.

7.12.11 Operational Flexibility/Anticipated Operating Scenarios

Operational flexibility is not set for the affected gasoline storage tanks.

7.12.12 Compliance Procedures

For the affected gasoline storage tanks, compliance with the applicable standards of Condition 7.12.3 is addressed by the work practices, testing, monitoring, recordkeeping and reporting requirements described in Section 7.12 of this permit.

7.12.13 State-Only Conditions

State-only conditions are not being established.

7.13 Fugitive Dust

7.13.1 Description

Fugitive dust is emitted from vehicle traffic, unloading operations, wind erosion of piles, roadways, parking lots and other open areas at the facility. The source also emits fugitive dust from an on-site landfill for furnace dusts and other industrial wastes.

Note: This narrative description is for informational purposes only and is not enforceable.

7.13.2 List of Emission Units and Air Pollution Control Equipment

Emission Unit	Description	Date Constructed	Emission Control Equipment
Fugitive Emissions	Landfill Vehicular Traffic on Roadways, Parking Lots and Other Open Areas Unloading Operations Storage Piles and associated activities Beaching Areas	N/A	N/A

7.13.3 Applicable Provisions and Regulations

a. The “affected activities” for the purpose of these unit-specific conditions, are the activities described in Conditions 7.13.1 and 7.13.2 above.

b. The affected activities are subject to 35 IAC 212.306 which provides that all normal traffic pattern roads and parking facilities which are located on mining or manufacturing property shall be paved or treated with water, oils or chemical dust suppressants. All paved areas shall be cleaned on a regular basis. All areas treated with water, oils or chemical dust suppressants shall have the treatment applied on a regular basis, as needed, in accordance with the operating program required by 35 IAC 212.309, 212.310 and 212.312.

c. All storage piles of materials with uncontrolled emissions of fugitive particulate matter in excess of 45.4 Mg per year (50 T/yr) which are located within a source whose potential particulate emissions from all emission units exceed 90.8 Mg/yr (100 T/yr) shall be protected by a cover or sprayed with a surfactant solution or water on a regular basis, as needed, or treated by an equivalent method, in

accordance with the operating program required by 35 IAC 212.309, 212.310 and 212.312 of 35 IAC Part 212 Subpart K [35 IAC 212.304(a)].

d. Applicable emission limitations established by 35 IAC 212.316:

i. Emission Limitations for Storage Piles. No person shall cause or allow fugitive particulate matter emissions from any storage pile to exceed an opacity of 10 percent, to be measured four ft from the pile surface.

ii. Additional Emissions Limitations for the Granite City Vicinity as defined in 35 IAC 212.316(e)(1):

Emissions Limitations for Roadways or Parking Areas Located at Integrated Iron and Steel Manufacturing Plants. No person shall cause or allow fugitive particulate matter emissions from any roadway or parking area located at a slag processing facility or integrated iron and steel manufacturing plant to exceed an opacity of 5 percent.

iii. Pursuant to 35 IAC 212.316(f), emission limitation for all other activities (see the definition for emission unit in 35 IAC 211.1950). Unless an activity has been assigned a particulate matter, PM_{10}, or fugitive particulate matter emissions limitation elsewhere in 35 IAC 212.316 or in Subparts R or S of 35 IAC Part 212, no person shall cause or allow fugitive particulate matter emissions from any such activity to exceed an opacity of 20 percent.

e. All conveyor loading operations to storage piles specified in 35 IAC 212.304 shall utilize spray systems, telescopic chutes, stone ladders or other equivalent methods in accordance with the operating program required by 35 IAC 212.309, 212.310 and 212.312 [35 IAC 212.305].

7.13.4 Non-Applicability of Regulations of Concern

The landfill operated on the site is not subject to 35 IAC Part 220 for municipal waste landfills. The landfill serves only the needs for Permittee’s operations in accepting industrial waste generated on-site and no municipal or any off-site waste is accepted by this landfill.

7.13.5 Control Requirements and Work Practices

a. Pursuant to permit #95010001 [T1], the Permittee shall comply with the following on-site and off-site fugitive dust control requirements:

i. On-site fugitive dust control

A. The Permittee shall sweep or flush at least every day the paved access area below the BOF ESP where ESP dust collection bags (i.e., super-sacks, storage bags or other containers for ESP dust) are used, stored and transported.

B. The Permittee shall implement a housekeeping program for the non-roadway areas below and around the BOF ESP. This program shall, at a minimum, contain the following:

1. The ground and other accessible areas where dust may gather shall be swept or cleaned at least every day;

2. Cleaning shall be performed in such a manner as to minimize the escape of dust into the atmosphere;

3. Dust collection bags shall be inspected at least daily for rips, tears, or insecure connection to the discharge of the ESP hoppers;

4. Dust collection bags shall be inspected after removal from, and connection to, the discharge of the ESP hoppers;

5. Ripped or torn bags shall be taken out of service and transported in a covered truck.

C. Unpaved Roads. For unpaved roads that are part of normal traffic patterns (including roads B, C, E, N, F-F, and CS(2)) the Permittee shall apply a chemical dust suppressant at least three times a month, with the following exceptions:

1. Road segment G-G, which shall be sprayed at least quarterly;

2. Road segment L, which shall be sprayed at least 4 times per month.

3. All other unpaved roads shall be treated as necessary.

4. Applications of suppressant may be less frequent than specified above if weather conditions, i.e., precipitation or temperature, interfere with the schedule for spraying, provided each such instance shall be recorded in accordance with the

daily records for on-site fugitive dust control required by Condition 7.13.9(b).

D. Paved roadways and areas. Paved roadways and areas shall be maintained in good condition by the Permittee.

On paved roadways and other areas, the Permittee shall sweep or flush as follows:

1. Road segments D, K, M, F, G, J, R, and O shall be swept or flushed at least daily;

2. Road segments P, V, W, X, Z, D-D, E-E, and CS(1) shall be swept or flushed at least five days per week;

3. Road segments S and T shall be swept or flushed at least every other day;

4. Road segments A and H shall be swept or flushed at least once per month;

5. All gate areas leading from the steelworks area shall be swept or flushed at least daily;

6. All gate areas leading from the iron making area shall be swept or flushed at least five times per week.

7. The above on-site dust control measures shall be conducted to maximize their effectiveness by performing said measures when the roads or areas are not obstructed by parked vehicles and by preferentially using filter sweeping (e.g., Enviro-Whirl sweeper) for the gate areas, the roads and areas surrounding the BOPF shop and BOF ESP.

b. The fugitive dust control measures outlined above do not relieve the Permittee from complying with additional control measures identified in the PM_{10} contingency plan as required by Condition 5.3.3 of this permit [95010001, T1R].

c. The landfill operated by the Permittee shall not accept any off-site wastes, including municipal, hospital/medical or hazardous wastes [Section 39.5(7)(l) of the Act].

d. Pursuant to the Road Cleaning Program required by Permit #06070088, the Permittee shall comply with the following control requirements (for purposes of this condition

affected road segments are those identified in Condition 7.13.5(d)(iii):

i. Good air pollution control practices shall be implemented to minimize and reduce nuisance dust from the affected road segments.

ii. Cleaning of affected road segments shall be performed using vacuum cleaning equipment (such as Enviro-Whirl). Any dust laden air shall be vented through a filtering system on the vacuum cleaning equipment before discharge to atmosphere.

The handling of material collected by vacuum cleaning equipment during road cleaning shall be enclosed or shall utilize spraying, pelletizing, screw conveying or other equivalent methods to control PM emissions from transfer of material for disposal.

iii. Affected road segments shall be cleaned on the following frequency except during extended periods of inclement weather that act to prevent emissions of fugitive dust from the affected road segments:

A. Cleaning on a twice weekly basis:

Road Segment	Segment Boundaries
Madison Ave	16th & 20th Streets
Central 20th Street	Madison St. & USS Gate
East 20th Street	USS Gate & Rte 203
21st Street	Rte 203 and Monroe St.
North Edwardsville Rd	20th & Nameoki (Rte 203)

B. Cleaning on a twice monthly basis:

Road Segment	Segment Boundaries
Rock Road	Rte 3 & W. 20th St. (Overpass Approach)
West 20th St.	Rte 3 & Rock Road
Rock Road	W. 20th & Benton St. (Railroad Overpass)
Niedringhaus	Benton St. and 16th St.
16th Street	Niedringhaus & Madison St.
South Edwardsville Rd	20th & McCambridge Ave (Rte 203)
McCambridge Ave	Edwardsville Rd (Rte 203) & 2nd St.
Route 162	Nameoki Rd (Rte 203) & Railroad Tracks
Benton Street	Rock Rd. and Niedringhaus

7.13.6 Production and Emission Limitations

Total fugitive emission of PM/PM_{10} from the roadways at the source shall not exceed 27 tons/year. Compliance with the

annual limits shall be determined based on a calendar year pursuant to Permit 95010001 [T1].

7.13.7 Testing Requirements

a. Opacity observations shall be conducted by a qualified observer in accordance with procedures published in 40 CFR Part 60, Appendix A, Method 9, except as specified below.

i. Opacity readings on each roadway or parking area shall be conducted at least annually. On unpaved roadways or parking areas, the reading shall not be conducted within three days of the application of any dust suppressants.

ii. The Permittee shall observe, one day per calendar month, the opacity of emissions from each active coal storage pile and areas travelled by equipment hauling coal from these coal storage piles to coal processing operations unless prolonged weather conditions preclude scheduled observations. In addition, the observer shall remain in the area for at least 3 hours to perform opacity readings on other coal piles which become active during this 3 hour period.

iii. All opacity readings conducted on visible emissions generated by vehicular traffic on roadways, parking areas and heavy equipment traffic associated with storage piles, shall be in accordance with the procedures specified in 35 IAC 212.109.

iv. All opacity readings on storage piles shall be measured four feet above the pile surface. The duration of opacity observations for each test shall be at least 30 minutes (five 6-minute averages) or 12 minutes without visible emissions.

b. Upon written request by the Illinois EPA, such testing shall be conducted for specific affected operations(s) within 45 calendar days of the request or on the date agreed upon by the Illinois EPA, whichever is later. As least 30 days prior to the scheduled test date, the Permittee shall submit a detailed test plan to the Illinois EPA, describing the manner of operations of the affected activity and all control measures that will be implemented during the testing. The results of the testing will be submitted within thirty calendar days of the completion of the tests.

c. The testing conditions from above are established in accordance with requirements of 39.5(7)(p) of the Act.

d. Pursuant to Permit 06070088, the Permittee shall conduct silt loading measurements as follows [T1] (for purposes of

this condition affected road segments are those identified in Condition 7.13.5(d)(iii)):

i. The Permittee shall conduct measurements of the silt loading on the affected road segments, with sampling and analysis conducted using the “Procedures for Sampling Surface/Bulk Dust Loading,” Appendix C.1 in Compilation of Air Pollutant Emission Factors, USEPA, AP-42. A series of samples shall be taken to determine the average silt loading on each affected road segment and address the change in silt loadings as related to the amount and nature of vehicle traffic.

ii. Measurements for “controlled” silt loading shall be repeated at least every three years pursuant to the Road Cleaning Program of Condition 7.13.5(d).

iii. Measurements for “controlled” silt loadings shall be conducted upon written request by the Illinois EPA, as specified in the request, which shall be completed within 75 days of the Illinois EPA’s request.

7.13.8 Monitoring Requirements

a. Except as provided in Condition 7.13.8(b), the Permittee shall perform inspections of the affected activities on at least a quarterly basis, including associated control measures, while the affected activities are in use, to confirm compliance with the requirements of Condition 7.13.3. Control measures may include material characteristics. These quarterly inspections may be scheduled so that only a number of affected activities are reviewed during each inspection, provided however, that all affected activities shall be inspected at least once during each calendar year. For the purpose of this condition, all affected activities means each type of material handled. (Sections 39.5(7)(a) and (d) of the Act).

b. The Permittee shall perform inspections, on a once per calendar month basis, during receipt of the truck unloading each contracted supply of coal.

c. As part of the inspections required by 7.13.8(a), the Permittee shall perform observations for visible emissions by Method 22. These observations shall be conducted during the operation of each activity for a minimum of 18 minutes, or for activities that operate on a batch basis, for a minimum of six consecutive batches. If visible emissions are observed, the Permittee shall take corrective action within 2 hours to return the status of the operation to no visible emissions or observations of opacity by Method 9 shall be conducted. For the purpose of this condition, returning the status of operations to no visible emissions

does not include, for any activity, temporary idling of lack of operation between batches.

d. The requirements from above are established pursuant to Sections 39.5(7)(a) and (d) of the Act.

7.13.9 Recordkeeping Requirements

The Permittee shall maintain records of the following items for the affected areas of fugitive emissions, pursuant to Sections 39.5(7)(a) and (e) of the Act:

a. Records required by 35 IAC 212.316(g):

i. The owner or operator of any fugitive particulate matter emission unit subject to 35 IAC 212.316 shall keep written records of the application of control measures for compliance with the opacity limitations of 212.316 and shall submit to the Illinois EPA an annual report containing a summary of such information.

ii. The records shall include at least the following:

A. The name and address of the source;

B. The name and address of the owner and/or operator of the source;

C. A map or diagram showing the location of all emission units controlled, including the location, identification, length, and width of roadways;

D. For each application of water or chemical solution to roadways by truck: the name and location of the roadway controlled, application rate of each truck, frequency of each application, width of each application, identification of each truck used, total quantity of water or chemical used for each application and, for each application of chemical solution, the concentration and identity of the chemical;

E. For application of physical or chemical control agents: the name of the agent, application rate and frequency, and total quantity of agent, and, if diluted, percent of concentration, used each day; and

F. A log recording incidents when control measures were not used and a statement of explanation.

iii. Copies of all records required by 35 IAC 212.316 shall be submitted to the Illinois EPA within ten (10) working days after a written request by the Illinois EPA and shall be transmitted to the Illinois EPA by a company-designated person with authority to release such records.

iv. The records required under 35 IAC 212.316 shall be kept and maintained for at least five (5) years at the source and be available for inspection and copying by Illinois EPA representatives during working hours.

b. i. The Permittee shall maintain daily records relative to the on-site fugitive dust control program which includes the following information at a minimum, pursuant to the Permit 95010001:

A. The date (and time for the gate areas) each road or area was treated;

B. The manner in which the road or area was treated (i.e., filter sweep, conventional sweep, suppressant spray or flush);

C. Detailed information for use of dust suppressant, including but not limited to the application rate, dilution ratio, type of suppressant used, and the number of gallons of suppressant applied;

D. Observations, if any, concerning the condition of the roadway, e.g., presence of parked vehicles, detection of potholes;

E. The amount of precipitation and temperature recorded for each day, and if determination was made to suspend application of suppressant, include name and title of person who made determination to suspend application and explanation; and

F. Any and all suspensions or deviations from the work practices and control procedures of Condition 7.13.5, with a date, description, and explanation for suspension of application.

ii. The Permittee shall keep a record containing calculations and analysis for the emissions from roadways at the source with emissions calculation performed in accordance with the methodology set forth in Section 13.2.1 of AP-42, to verify compliance with Condition 7.13.6. A copy of this record shall be submitted to the Illinois EPA each time it is prepared, with submittal made within 15

days of the date that the Permittee completes the preparation of new or revised calculations and analysis.

c. The Permittee shall maintain the most current versions of the PM_{10} contingency plan and the fugitive particulate matter control program.

d. The Permittee shall keep records of the silt measurements conducted pursuant to Condition 7.13.7(d), including records for the sampling and analysis activities and results.

e. Recordkeeping requirements for the Road Cleaning Program (for purposes of this condition affected road segments are those identified in Condition 7.13.5(d)(iii):

i. A. The Permittee shall keep a record describing the Road Cleaning Program that at a minimum: identify any contractors implementing the program for the Permittee and their duties for implementing the Program under the contract; the equipment used by the Permittee or its contractor for cleaning roads, including for each item of equipment, a description of and the manufacturer’s specifications for collection of silt from roadways and control of dust emissions from the cleaning process; and the standards practices that are used to clean roads under the Program, such as type of equipment, and speed of travel.

B. The Permittee shall keep records for implementation of the Road Cleaning Program that at a minimum: Identify each time that an affected road segment was cleaned, with a description of any circumstances that may have affected the extent or nature of cleaning; and identify each time that scheduled cleaning was not performed, with detailed explanation.

C. The Permittee shall keep records documenting maintenance and repair of road cleaning equipment.

ii. The Permittee shall keep a record containing calculations and analysis for the annual reduction in emissions that is achieved by the Road Cleaning Program, with emissions calculation performed in accordance with the methodology set forth in Section 13.2.1 of AP-42, to verify that the Road Cleaning Program is achieving 236.03 tons/yr reduction, total, of particulate matter determined as PM_{10} from baseline emission levels of 656.87 tons/year from the affected road segments. This record shall be prepared in

conjunction with the measurements of “controlled” silt loadings required by Condition 7.13.7(d). A copy of this record shall be submitted to the Illinois EPA each time it is prepared, with submittal made to the Illinois EPA within 15 days of the date that the Permittee completes the preparation of new or revised calculations and analysis.

7.13.10 Reporting Requirements

The Permittee shall promptly notify the Illinois EPA, Air Compliance Section, of deviations of the affected area of fugitive emissions with the permit requirements, pursuant to Section 39.5(7)(f)(ii) of the Act. Reports submitted by the Permittee shall describe the probable cause of such deviations, and any corrective actions or preventive measures taken.

a. i. Pursuant 35 IAC 212.316(g)(5), the Permittee shall submit a quarterly report to the Illinois EPA stating the following: the dates any necessary control measures were not implemented, a listing of those control measures, the reasons that the control measures were not implemented, and any corrective actions taken. This information includes, but is not limited to, those dates when controls were not applied based on a belief that application of such control measures would have been unreasonable given prevailing atmospheric conditions, which shall constitute a defense to the requirements of 35 IAC 212.316. This report shall be submitted to the Agency thirty (30) calendar days from the end of a quarter. Quarters end March 31, June 30, September 30, and December 31.

ii. Pursuant to permit 06070088, the Permittee shall submit a quarterly report to the Illinois EPA describing the implementation of the Road Cleaning Program during the previous quarter. This report shall at a minimum provide: the number of times each road segment was cleaned; the number of times that cleaning was not performed, with explanation; a description of any significant changes in road cleaning equipment or cleaning practices, with explanation; and a description of other changes to the Road Cleaning Program, including changes in contractors.

b. i. Pursuant to Section 39.5(7)(f)(ii) of the Act, the Permittee shall promptly notify the Illinois EPA, Air Compliance Section, within 30 days of deviations in the affected areas of fugitive emissions, as follows:

A. Requirements in Condition 7.13.3(b) through (e).

B. Requirements in Condition 7.13.5.

C. Requirements in Condition 7.13.6.

ii. All such deviations shall be summarized and reported as part of the semiannual monitoring report required by Condition 8.6.1.

c. The Permittee shall notify the Illinois EPA, Air Compliance Section, of all other deviations as part of the semiannual monitoring reports required by Condition 8.6.1.

d. Deviation reports described in Condition 7.13.10(b) and (c) above shall contain the following:

i. Date, time and duration of the deviation;

ii. Description of the deviation;

iii. Probable cause of the deviation; and

iv. Any corrective action or preventive measures taken.

7.13.11 Operational Flexibility/Anticipated Operating Scenarios

a. Beaching

The following requirements established by Permits 72080034 and 72080036 shall be implemented:

i. Under the following circumstances beaching of iron may occur:

A. In the event that Blast Furnace A or Blast Furnace B must be shut down in order to cast the furnace dry.

B. In the event that an interruption in the BOF steelmaking and/or casting operations will result in a temporary surplus of iron, beyond the capacity of the system to hold, necessitating beaching in order to cast the furnace dry and provide the ability to safely shut down.

C. In the event that the blast furnace produces unusable iron such as high silica or low temperature iron. High silica iron shall be blended and used to the extent possible at the BOF in order to reduce beaching. Low temperature iron shall be used at the BOF to the extent possible until solidification in the car becomes imminent. In other cases of

unusable iron, such iron shall be used when possible to minimize the quantity beached.

ii. In the event that the beaching of iron occurs the Permittee shall beach the iron as follows:

A. Beaching shall be allowed only in the event that alternate receptacles are not available;

B. Beaching shall be allowed only if all reasonable measures are taken to minimize the quantity of liquid metal beached, the frequency of a malfunction or breakdown that necessitates beaching, the duration beaching occurs, and the emissions resulting from beaching; and

C. Beaching shall be allowed at a controlled pour rate not to exceed 20 tons per minute.

b. Prior to material in the beaching pit being dug and transferred to vehicles for recycling to the blast furnaces, it shall be watered or treated with other equivalent techniques to minimize particulate matter emissions during such material handling, unless such measures would cause a hazard or safety issue to employees.

7.13.12 Compliance Procedures

a. Compliance with Condition 7.13.3(b) is addressed by the monitoring requirements in Condition 7.13.8(b) and the records in Condition 7.13.9.

b. Compliance with Condition 7.13.3(c), (d), 7.13.5(a), (d), and 7.13.6 is addressed by the testing in Condition 7.13.7, monitoring requirements in Condition 7.13.8(a) and the records in Condition 7.13.9.

c. Compliance with Condition 7.13.3(e) is addressed by the testing requirements Condition 7.13.7, monitoring in Condition 7.13.8(c) and the records in Condition 7.13.9.

d. Compliance with Condition 7.13.5(c) is addressed by the records in Condition 7.13.9.

7.13.13 State-Only Conditions

State-only conditions are not being established.

8.0 GENERAL PERMIT CONDITIONS

8.1 Permit Shield

Pursuant to Section 39.5(7)(j) of the Act, the Permittee has requested and has been granted a permit shield. This permit shield provides that compliance with the conditions of this permit shall be deemed compliance with applicable requirements which were applicable as of the date the proposed permit for this source was issued, provided that either the applicable requirements are specifically identified within this permit, or the Illinois EPA, in acting on this permit application, has determined that other requirements specifically identified are not applicable to this source and this determination (or a concise summary thereof) is included in this permit.

This permit shield does not extend to applicable requirements which are promulgated after May 2, 2011, unless this permit has been modified to reflect such new requirements.

8.2 Applicability of Title IV Requirements (Acid Deposition Control)

This source is not an affected source under Title IV of the CAA and is not subject to requirements pursuant to Title IV of the CAA.

8.3 Emissions Trading Programs

No permit revision shall be required for increases in emissions allowed under any USEPA approved economic incentives, marketable permits, emissions trading, and other similar programs or processes for changes that are provided for elsewhere in this permit and that are authorized by the applicable requirement [Section 39.5(7)(o)(vii) of the Act].

8.4 Operational Flexibility/Anticipated Operating Scenarios

8.4.1 Changes Specifically Addressed by Permit

Physical or operational changes specifically addressed by the conditions of this permit that have been identified as not requiring Illinois EPA notification may be implemented without prior notice to the Illinois EPA.

8.4.2 Changes Requiring Prior Notification

The Permittee is authorized to make physical or operational changes that contravene express permit terms without applying for or obtaining an amendment to this permit, provided that [Section 39.5(12)(a)(i) of the Act]:

a. The changes do not violate applicable requirements;

b. The changes do not contravene federally enforceable permit terms or conditions that are monitoring (including test methods), recordkeeping, reporting, or compliance certification requirements;

c. The changes do not constitute a modification under Title I of the CAA;

d. Emissions will not exceed the emissions allowed under this permit following implementation of the physical or operational change; and

e. The Permittee provides written notice to the Illinois EPA, Division of Air Pollution Control, Permit Section, at least 7 days before commencement of the change. This notice shall:

i. Describe the physical or operational change;

ii. Identify the schedule for implementing the physical or operational change;

iii. Provide a statement of whether or not any New Source Performance Standard (NSPS) is applicable to the physical or operational change and the reason why the NSPS does or does not apply;

iv. Provide emission calculations which demonstrate that the physical or operational change will not result in a modification; and

v. Provide a certification that the physical or operational change will not result in emissions greater than authorized under the conditions of this permit.

8.5 Testing Procedures

Tests conducted to measure composition of materials, efficiency of pollution control devices, emissions from process or control equipment, or other parameters shall be conducted using standard test methods if applicable test methods are not specified by the applicable regulations or otherwise identified in the conditions of this permit. Documentation of the test date, conditions, methodologies, calculations, and test results shall be retained pursuant to the recordkeeping procedures of this permit. Reports of any tests conducted as required by this permit or as the result of a request by the Illinois EPA shall be submitted as specified in Conditions 8.6.3 and 8.6.4.

8.6 Reporting Requirements

8.6.1 Monitoring Reports

Semiannual reports, including monitoring reports summarizing required monitoring as specified in the conditions of this permit shall be submitted to the Illinois EPA, unless more frequent submittal of such reports is required in Sections 5 or 7 of this permit [Section 39.5(7)(f) of the Act]:

Monitoring Period	Report Due Date
January - June	July 31
July - December	January 31

All instances of deviations from permit requirements must be clearly identified in such reports. All such reports shall be certified in accordance with Condition 9.9.

8.6.2 Test Notifications

Unless otherwise specified elsewhere in this permit, a written test plan for any test required by this permit shall be submitted to the Illinois EPA for review at least 60 days prior to the testing pursuant to Section 39.5(7)(a) of the Act. The notification shall include at a minimum:

a. The name and identification of the affected unit(s);

b. The person(s) who will be performing sampling and analysis and their experience with similar tests;

c. The specific conditions under which testing will be performed, including a discussion of why these conditions will be representative of maximum emissions and the means by which the specified operating parameters, as defined in Section 7 for each emission unit and any control equipment, will be determined;

d. The specific determinations of emissions and operation that are intended to be made, including sampling and monitoring locations;

e. The test method(s) that will be used, with the specific analysis method, if the method can be used with different analysis methods;

f. Any minor changes in standard methodology proposed to accommodate the specific circumstances of testing, with justification; and

g. Any proposed use of an alternative test method, with detailed justification.

8.6.3 Test Reports

Unless otherwise specified elsewhere in this permit, the results of any test required by this permit shall be submitted to the Illinois EPA within 60 days of completion of the testing. The test report shall include at a minimum [Section 39.5(7)(e)(i) of the Act]:

a. The name and identification of the affected unit(s);

b. The date and time of the sampling or measurements;

c. The date any analyses were performed;

d. The name of the company that performed the tests and/or analyses;

e. The test and analytical methodologies used;

f. The results of the tests including raw data, and/or analyses including sample calculations;

g. The operating conditions at the time of the sampling or measurements; and

h. The name of any relevant observers present including the testing company’s representatives, any Illinois EPA or USEPA representatives, and the representatives of the source.

8.6.4 Reporting Addresses

a. Unless otherwise specified in the particular provision of this permit or in the written instructions distributed by the Illinois EPA for particular reports, reports and notifications shall be sent to the Illinois EPA - Air Compliance Unit with a copy sent to the Illinois EPA - Air Regional Field Office.

b. All test protocols, test notifications and test reports shall be sent to the Illinois EPA - Air Compliance Unit with a copy sent to the Illinois EPA - Air Regional Field Office and to the Illinois EPA – Stack Test Specialist.

c. As of the date of issuance of this permit, the addresses of the offices that should generally be utilized for the submittal of reports and notifications are as follows:

i. Illinois EPA - Air Compliance Unit

Illinois Environmental Protection Agency
Bureau of Air
Compliance & Enforcement Section (MC 40)
1021 North Grand Avenue East
P.O. Box 19276
Springfield, Illinois 62794-9276

ii. Illinois EPA – Stack Test Specialist

Illinois Environmental Protection Agency
Division of Air Pollution Control
9511 West Harrison
Des Plaines, Illinois 60016

iii. Illinois EPA - Air Quality Planning Section

Illinois Environmental Protection Agency
Bureau of Air

Air Quality Planning Section (MC 39)
1021 North Grand Avenue East
P.O. Box 19276
Springfield, Illinois 62794-9276

iv. Illinois EPA - Air Regional Field Office

Illinois Environmental Protection Agency
Division of Air Pollution Control
2009 Mall Street
Collinsville, Illinois 62234

v. USEPA Region 5 - Air Branch

USEPA (AR - 17J)
Air & Radiation Division
77 West Jackson Boulevard
Chicago, Illinois 60604

d. Permit applications should be addressed to the Air Permit Section. As of the date of issuance of this permit, the address of the Air Permit Section is as follows:

Illinois Environmental Protection Agency
Division of Air Pollution Control
Permit Section (MC 11)
1021 North Grand Avenue East
P.O. Box 19506
Springfield, Illinois 62794-9506

8.7 Title I Conditions

Notwithstanding the expiration date on the first page of this CAAPP permit, Title I conditions in this permit, which are identified by a T1, T1N, or T1R designation, remain in effect until such time as the Illinois EPA takes action to revise or terminate them in accordance with applicable procedures for action on Title I conditions. This is because these conditions either: (a) incorporate conditions of earlier permits that were issued by the Illinois EPA pursuant to authority that includes authority found in Title I of the CAA (T1 conditions), (b) were newly established in this CAAPP permit pursuant to authority that includes such Title I authority (T1N conditions), or (c) reflect a revision or combination of conditions established in this CAAPP permit (T1R conditions). (See also Condition 1.5.)

9.0 STANDARD PERMIT CONDITIONS

9.1 Effect of Permit

9.1.1 The issuance of this permit does not release the Permittee from compliance with State and Federal regulations which are part of the Illinois State Implementation Plan, as well as with other applicable statutes and regulations of the United States or the State of Illinois or applicable ordinances, except as specifically stated in this permit and as allowed by law and rule.

9.1.2 In particular, this permit does not alter or affect the following [Section 39.5(7)(j)(iv) of the Act]:

a. The provisions of Section 303 (emergency powers) of the CAA, including USEPA's authority under that Section;

b. The liability of an owner or operator of a source for any violation of applicable requirements prior to or at the time of permit issuance;

c. The applicable requirements of the acid rain program consistent with Section 408(a) of the CAA; and

d. The ability of USEPA to obtain information from a source pursuant to Section 114 (inspections, monitoring, and entry) of the CAA.

9.1.3 This permit and the terms and conditions herein do not affect the Permittee's past and/or continuing obligation with respect to statutory or regulatory requirements governing major source construction or modification under Title I of the CAA. Further, neither the issuance of this permit nor any of the terms or conditions of the permit shall alter or affect the liability of the Permittee for any violation of applicable requirements prior to or at the time of permit issuance.

9.1.4 Except as provided by applicable law, the issuance of this permit by the Illinois EPA does not and shall not be construed as barring, diminishing, adjudicating or in any way affecting any currently pending or future legal, administrative or equitable rights or claims, actions, suits, causes of action or demands whatsoever that the Illinois EPA or the USEPA may have against the applicant including, but not limited to, any enforcement action authorized pursuant to the provision of applicable federal and state law.

9.1.5 Notwithstanding the conditions of this permit specifying compliance practices for applicable requirements, pursuant to Section 39.5(7)(j) and (p) of the Act, any person (including the Permittee) may also use other credible evidence to establish compliance or noncompliance with applicable requirements.

9.1.6 In the event of an action to enforce the terms or conditions of this permit, this permit does not prohibit a Permittee from invoking any affirmative defense that is provided by the applicable law or rule.

9.2 General Obligations of Permittee

9.2.1 Duty to Comply

The Permittee must comply with all terms and conditions of this permit. Any permit noncompliance constitutes a violation of the CAA and the Act, and is grounds for any or all of the following: enforcement action; permit termination, revocation and reissuance, or modification; or denial of a permit renewal application [Section 39.5(7)(o)(i) of the Act].

The Permittee shall meet applicable requirements that become effective during the permit term in a timely manner unless an alternate schedule for compliance with the applicable requirement is established.

9.2.2 Duty to Maintain Equipment

The Permittee shall maintain all equipment covered under this permit in such a manner that the performance or operation of such equipment shall not cause a violation of applicable requirements.

9.2.3 Duty to Cease Operation

No person shall cause, threaten or allow the continued operation of any emission unit during malfunction or breakdown of the emission unit or related air pollution control equipment if such operation would cause a violation of an applicable emission standard, regulatory requirement, ambient air quality standard or permit limitation unless this permit provides for such continued operation consistent with the Act and applicable Illinois Pollution Control Board regulations [Section 39.5(6)(c) of the Act].

9.2.4 Disposal Operations

The source shall be operated in such a manner that the disposal of air contaminants collected by the equipment operations, or activities shall not cause a violation of the Act or regulations promulgated there under.

9.2.5 Duty to Pay Fees

The Permittee must pay fees to the Illinois EPA consistent with the fee schedule approved pursuant to Section 39.5(18) of the Act, and submit any information relevant thereto [Section 39.5(7)(o)(vi) of the Act]. The check should be payable to “Treasurer, State of Illinois” and sent to: Fiscal Services

Section, Illinois Environmental Protection Agency, P.O. Box 19276, Springfield, Illinois, 62794-9276.

9.3 Obligation to Allow Illinois EPA Surveillance

Upon presentation of proper credentials and other documents as may be required by law and in accordance with constitutional limitations, the Permittee shall allow the Illinois EPA, or an authorized representative to perform the following [Sections 4 and 39.5(7)(a) and (p)(ii) of the Act]:

a. Enter upon the Permittee's premises where an actual or potential emission unit is located; where any regulated equipment, operation, or activity is located or where records must be kept under the conditions of this permit;

b. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit;

c. Inspect during hours of operation any sources, equipment (including monitoring and air pollution control equipment), practices, or operations regulated or required under this permit;

d. Sample or monitor any substances or parameters at any location:

i. At reasonable times, for the purposes of assuring permit compliance or applicable requirements; or

ii. As otherwise authorized by the CAA, or the Act.

e. Obtain and remove samples of any discharge or emission of pollutants authorized by this permit; and

f. Enter and utilize any photographic, recording, testing, monitoring, or other equipment for the purposes of preserving, testing, monitoring, or recording any activity, discharge or emission at the source authorized by this permit.

9.4 Obligation to Comply with Other Requirements

The issuance of this permit does not release the Permittee from applicable State and Federal laws and regulations, and applicable local ordinances addressing subjects other than air pollution control.

9.5 Liability

9.5.1 Title

This permit shall not be considered as in any manner affecting the title of the premises upon which the permitted source is located.

9.5.2 Liability of Permittee

This permit does not release the Permittee from any liability for damage to person or property caused by or resulting from the construction, maintenance, or operation of the sources.

9.5.3 Structural Stability

This permit does not take into consideration or attest to the structural stability of any unit or part of the source.

9.5.4 Illinois EPA Liability

This permit in no manner implies or suggests that the Illinois EPA (or its officers, agents or employees) assumes any liability, directly or indirectly, for any loss due to damage, installation, maintenance, or operation of the source.

9.5.5 Property Rights

This permit does not convey any property rights of any sort, or any exclusive privilege [Section 39.5(7)(o)(iv) of the Act].

9.6 Recordkeeping

9.6.1 Control Equipment Maintenance Records

A maintenance record shall be kept on the premises for each item of air pollution control equipment. At a minimum, this record shall show the dates of performance and nature of preventative maintenance activities.

9.6.2 Records of Changes in Operation

A record shall be kept describing changes made at the source that result in emissions of a regulated air pollutant subject to an applicable Clean Air Act requirement, but not otherwise regulated under this permit, and the emissions resulting from those changes [Section 39.5(12)(b)(iv) of the Act].

9.6.3 Retention of Records

a. Records of all monitoring data and support information shall be retained for a period of at least 5 years from the date of the monitoring sample, measurement, report, or application. Support information includes all calibration and maintenance records, original strip-chart recordings for continuous monitoring instrumentation, and copies of all reports required by this permit [Section 39.5(7)(e)(ii) of the Act].

b. Other records required by this permit including any logs, plans, procedures, or instructions required to be kept by this permit shall be retained for a period of at least 5

years from the date of entry unless a longer period is specified by a particular permit provision.

9.7 Annual Emissions Report

The Permittee shall submit an annual emissions report to the Illinois EPA, Air Quality Planning Section no later than May 1 of the following year, as required by 35 IAC Part 254.

9.8 Requirements for Compliance Certification

Pursuant to Section 39.5(7)(p)(v) of the Act, the Permittee shall submit annual compliance certifications. The compliance certifications shall be submitted no later than May 1 or more frequently as specified in the applicable requirements or by permit condition. The compliance certifications shall be submitted to the Air Compliance Unit, Air Regional Field Office, and USEPA Region 5 – Air Branch. The addresses for the submittal of the compliance certifications are provided in Condition 8.6.4 of this permit.

a. The certification shall include the identification of each term or condition of this permit that is the basis of the certification; the compliance status; whether compliance was continuous or intermittent; the method(s) used for determining the compliance status of the source, both currently and over the reporting period consistent with the conditions of this permit.

b. All compliance certifications shall be submitted to USEPA Region 5 in Chicago as well as to the Illinois EPA.

c. All compliance reports required to be submitted shall include a certification in accordance with Condition 9.9.

9.9 Certification

Any document (including reports) required to be submitted by this permit shall contain a certification by a responsible official of the Permittee that meets the requirements of Section 39.5(5) of the Act and applicable regulations [Section 39.5(7)(p)(i) of the Act]. An example Certification by a Responsible Official is included as Attachment 1 to this permit.

9.10 Defense to Enforcement Actions

9.10.1 Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for the Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit [Section 39.5(7)(o)(ii) of the Act].

9.10.2 Emergency Provision

a. An emergency shall be an affirmative defense to an action brought for noncompliance with the technology-based emission limitations under this permit if the following conditions are met through properly signed, contemporaneous operating logs, or other relevant evidence [Section 39.5(7)(k) of the Act]:

i. An emergency occurred as provided in Section 39.5(7)(k) of the Act and the Permittee can identify the cause(s) of the emergency.

Note: For this purpose, emergency means a situation arising from sudden and reasonably unforeseeable events beyond the control of the source, as further defined by Section 39.5(7)(k)(iv) of the Act.

ii. The permitted source was at the time being properly operated;

iii. The Permittee submitted notice of the emergency to the Illinois EPA within two working days of the time when emission limitations were exceeded due to the emergency. This notice must contain a detailed description of the emergency, any steps taken to mitigate emissions, and corrective actions taken; and

iv. During the period of the emergency the Permittee took all reasonable steps to minimize levels of emissions that exceeded the emission limitations, standards, or regulations in this permit.

b. This provision is in addition to any emergency or upset provision contained in any applicable requirement. This provision does not relieve a Permittee of any reporting obligations under existing federal or state laws or regulations [Section 39.5(7)(k)(iv) of the Act].

9.11 Permanent Shutdown

This permit only covers emission units and control equipment while physically present at the indicated source location(s). Unless this permit specifically provides for equipment relocation, this permit is void for the operation or activity of any item of equipment on the date it is removed from the permitted location(s) or permanently shut down. This permit expires if all equipment is removed from the permitted location(s), notwithstanding the expiration date specified on this permit.

9.12 Reopening and Reissuing Permit for Cause

9.12.1 Permit Actions

This permit may be modified, revoked, reopened and reissued, or terminated for cause in accordance with applicable provisions of Section 39.5 of the Act. The filing of a request by the Permittee for a permit modification, revocation and reissuance, or termination, or of a notification of planned changes or anticipated noncompliance does not stay any permit condition [Section 39.5(7)(o)(iii) of the Act].

9.12.2 Reopening and Revision

This permit must be reopened and revised if any of the following occur [Section 39.5(15)(a) of the Act]:

a. Additional requirements become applicable to the equipment covered by this permit and three or more years remain before expiration of this permit.

b. Additional requirements become applicable to an affected source for acid deposition under the acid rain program.

c. The Illinois EPA or USEPA determines that this permit contains a material mistake or that inaccurate statement were made in establishing the emission standards or limitations, or other terms or conditions of this permit.

d. The Illinois EPA or USEPA determines that this permit must be revised or revoked to ensure compliance with the applicable requirements.

9.12.3 Inaccurate Application

The Illinois EPA has issued this permit based upon the information submitted by the Permittee in the permit application. Any misinformation, false statement or misrepresentation in the application shall be grounds for revocation and reissuance under Section 39.5(15) of the Act, pursuant to Sections 39.5(5)(e) and (i) of the Act.

9.12.4 Duty to Provide Information

The Permittee shall furnish to the Illinois EPA, within a reasonable time specified by the Illinois EPA any information that the Illinois EPA may request in writing to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit, or to determine compliance with this permit. Upon request, the Permittee shall also furnish to the Illinois EPA copies of records required to be kept by this permit, or for information claimed to be confidential, the Permittee may furnish such records directly to USEPA along with a claim of confidentiality [Section 39.5(7)(o)(v) of the Act].

9.13 Severability Clause

The provisions of this permit are severable. In the event of a challenge to any portion of the permit, other portions of the permit may continue to be in effect. Should any portion of this permit be determined to be illegal or unenforceable, the validity of the other provisions shall not be affected and the rights and obligations of the Permittee shall be construed and enforced as if this permit did not contain the particular provisions held to be invalid and the applicable requirements underlying these provisions shall remain in force [Section 39.5(7)(i) of the Act].

9.14 Permit Expiration and Renewal

Upon the expiration of this permit, if the source is operated, it shall be deemed to be operating without a permit unless a timely and complete CAAPP application has been submitted for renewal of this permit. However, if a timely and complete application to renew this CAAPP permit has been submitted, the terms and all conditions of this CAAPP permit will remain in effect until the issuance of a renewal permit [Section 39.5(5)(l) and (o) of the Act].

Note: Pursuant to Sections 39.5(5)(h) and (n) of the Act, upon submittal of a timely and complete renewal application, the permitted source may continue to operate until final action is taken by the Illinois EPA on the renewal application, provided, however, that this protection shall cease if the applicant fails to submit any additional information necessary to evaluate or take final action on the renewal application as requested by the Illinois EPA in writing. For a renewal application to be timely, it must be submitted no later than 9 months prior to the date of permit expiration.

9.15 General Authority for the Terms and Conditions of this Permit

The authority for terms and conditions of this permit that do not include a citation for their authority is Section 39.5(7)(a) of the Act, which provides that the Illinois EPA shall include such provisions in a CAAPP permit as are necessary to accomplish the purposes of the Act and to assure compliance with all applicable requirements. Section 39.5(7)(a) of the Act is also another basis of authority for terms and conditions of this permit that do include a specific citation for their authority.

Note: This condition is included in this permit pursuant to Section 39.5(7)(n) of the Act.

10.0 ATTACHMENTS

Attachment 1 Example Certification by a Responsible Official

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Attachment 2 Emissions of Particulate Matter from Process Emission Units

10.2.1. Process Emission Units for Which Construction or Modification Commenced On or After April 14, 1972

a. New Process Emission Units for Which Construction or Modification Commenced On or After April 14, 1972 [35 IAC 212.321].

b. No person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced on or after April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in subsection (c) of 35 IAC 212.321 [35 IAC 212.321(a)].

i. The emissions of particulate matter into the atmosphere in any one hour period from the affected coating lines shall not exceed the allowable emission rates specified in the following equation:

$$E = A\ (P)^B$$

Where:

P = Process weight rate

E = Allowable emission rate

ii. For process weight rates of 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.214	2.54
B	0.534	0.534

iii. For process weight rates in excess of 408 Mg/hr (450 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	11.42	24.8
B	0.16	0.16

c. Limits for Process Emission Units for which Construction or Modification Commenced On or After April 14, 1972 [35 IAC 212.321(c)]:

Metric		English	
P	E	P	E
Mg/hr	kg/hr	T/hr	lb/hr
0.05	0.25	0.05	0.55
0.1	0.29	0.10	0.77
0.2	0.42	0.2	1.10

360.0	28.0	400.00	62.00
408.0	30.1	450.00	66.00
454.0	30.4	500.00	67.00

10.2.2 Process Emission Units for Which Construction or Modification Commenced Prior to April 14, 1972

a. No person shall cause or allow the emission of particulate matter into the atmosphere in any one hour period from any new process emission unit, either alone or in combination with the emission of particulate matter from all other similar process emission units for which construction or modification commenced prior to April 14, 1972, at a source or premises, exceeds the allowable emission rates specified in subsection (c) of 35 IAC 212.322 [35 IAC 212.322(a)].

b. The emissions of particulate matter into the atmosphere in any one hour period from the affected unit shall not exceed the allowable emission rates specified in the following equation:

$$E = C + A\ (P)^B$$

Where:

P = Process weight rate

E = Allowable emission rate

i. For process weight rates up to 27.2 Mg/hr (30 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	1.985	4.10
B	0.67	0.67
C	0	0

ii. For process weight rates in excess of 27.2 Mg/hr (30 T/hr):

	Metric	English
P	Mg/hr	T/hr
E	kg/hr	lbs/hr
A	25.21	55.0
B	0.11	0.11

Attachment 3 Current Emission Factors for Certain Emission Limits

This attachment provides information, based on information provided by the Permittee as of the date of issuance of this revised permit, on the emission factors used by the Permittee to demonstrate compliance with certain emission limits for Material Handling Operations (Section 7.1), Blast Furnace Operations (Section 7.4), Basic Oxygen Process Operations (Section 7.5) and Continuous Casting Activities (Section 7.6), which limits have been carried over from Construction Permit/PSD Approval 95010001. (See also Condition 5.13.)

Operation (Permit Condition)	Pollutant	Emission Factor	Basis
Material Handling Operations (Section 7.1)			
Ladle Metallurgy Material Handling (7.1.6(b)(i))	PM	0.00355 lb/ton	steel
	PM10	0.00355 lb/ton	steel
BOF Additive System (7.1.6(b)(ii))	PM	0.00032 lb/ton	steel
	PM10	0.00032 lb/ton	steel
Flux conveyor Operations (7.1.6(b)(iii))	PM	0.0016 lb/ton	steel
	PM10	0.0016 lb/ton	steel
Iron Pellet Screening (7.1.6(b)(iv))	PM	0.00279 lb/ton	iron pellets
	PM10	0.00279 lb/ton	iron pellets
Blast Furnace Operations (Section 7.4)			
Casthouse (7.4.6(b))	PM	0.0703 lb/ton	iron
	PM_{10}	0.0703 lb/ton	iron
	SO_2	0.2006 lb/ton	iron
	NO_x	0.0144 lb/ton	iron
	VOM	0.0946 lb/ton	iron
Blast Furnace Uncaptured Emissions (7.4.6(c))	PM	0.031 lb/ton	iron
	PM_{10}	0.0155 lb/ton	iron
	SO_2	0.0104 lb/ton	iron
	NO_x	0.0007 lb/ton	iron
	VOM	0.0047 lb/ton	iron
Blast Furnace Charging (7.4.6(d))	PM	0.0024 lb/ton	iron pellets
	PM_{10}	0.0024 lb/ton	iron pellets
Slag Pits (7.4.6(e))	PM	0.00417 lb/ton	iron
	PM_{10}	0.00417 lb/ton	iron
	SO_2	0.01 lb/ton	iron
Iron Spout (7.4.6(f))	PM	0.02548 lb/ton	iron
	PM_{10}	0.02548 lb/ton	iron
	SO_2	0.0073 lb/ton	iron

Operation (Permit Condition)	Pollutant	Emission Factor	Basis
Basic Oxygen Process Operations (Section 7.5)			
BOF Electrostatic Precipitator (7.5.6(c))	PM	0.16 lb/ton	steel
	PM_{10}	0.16 lb/ton	steel
	NO_x	0.0389 lb/ton*	steel
	VOM	0.006 lb/ton**	steel
	CO	8.993 lb/ton	steel
	Lead	0.1934 lb/hr	-

Baghouse #1 (7.6.6(a))	PM	0.00355 lb/ton	steel
	PM_{10}	0.00355 lb/ton	steel
Continuous Caster Molds (7.6.6(b))	PM	0.006 lb/ton	steel
	PM_{10}	0.006 lb/ton	steel
	NO_x	0.05 lb/ton	steel
Cont. Caster Spray Chambers (7.6.6(c))	PM	0.00852 lb/ton	steel
	PM_{10}	0.00852 lb/ton	steel
Slab Cutoff (7.6.6(d))	PM	0.0071 lb/ton	steel
	PM_{10}	0.0071 lb/ton	steel
Slab Ripping (7.6.6(e))	PM	0.00722 lb/ton	steel
	PM_{10}	0.00722 lb/ton	steel

* As of the date of issuance of this permit, the Permittee had not notified the Illinois EPA of the updated NOx emission factor that it will be using for the BOF ESP as a consequence of the results of recent testing that indicated that a factor of 0.0389 pounds/ton would understate actual emissions. The NOx emission rates measured during such testing, in April 2012 and July 2012, were, respectively, 0.1273 and 0.1535 pounds per ton of steel.

** As of the date of issuance of this permit, the Permittee had not notified the Illinois EPA of the updated VOM emission factor that it will be using for the BOF ESP as a consequence of the results of recent testing that indicated that a factor of 0.006 pounds/ton would understate actual emissions. The VOM emission rates measured during such testing in April 2012 and July 2012, respectively, were 0.023 and 0.0153 pounds per ton of steel.

Mr. Donald Sutton
Manager, Permit Section
Division of Air Pollution Control
Illinois Environmental Protection Agency
1340 North 9th Street
Springfield, Illinois 62702

Subject: Application for a Construction Permit to increase production at the following operations. A & B Blast Furnaces, BOF and Continuous Casters 1 & 2, Application Nos. BF 089460 0, BOF 089457 0, and CC 089421 0, respectively; I.D. No. 119813 AAI

Dear Mr. Sutton:

Granite City Division (GCD) of National Steel Corporation is requesting a Construction Permit to increase production at the subject operation.

Over the last three years National Steel Corporation has reported net income (losses) excluding unusual and extraordinary items of ($247) million dollars. GCD must increase production capacity to improve profitability during the current strong steel market and reduce production cost in order to improve competitiveness and assure its long-term survival. GCD currently employs more than 3,000 workers and contributes in excess of 1 billion dollars annually to the local economy. The Granite City, City Counsel recently passed a resolution recognizing GCD's future viability as absolutely essential to the success of government services in the area and requesting favorable consideration of the proposal production increases.

The attached permit application addresses the environmental impact of the proposed production increase. GCD recognizes the need and has committed the resources necessary to meet all applicable environmental requirements.

RECEIVED
IEPA
JAN - 5 1995
COLLINSVILLE OFFICE

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

GCD is requesting an expedited review of its application and issuance of the permit modification. GCD requests a public hearing be held by the IEPA as soon as practicable within the time of the permit review process.

Should you have any questions regarding this application please contact Larry Siebenberger, telephone (618) 451-3391.

1.0 INTRODUCTION

1.1 PROJECT OVERVIEW

The Granite City Division of National Steel Corporation is proposing to increase production at it's steel mill in Granite City, Illinois. This application is proposed to permit an increase the production rate of the existing Blast Furnaces, Basic Oxygen Furnaces, and Continuous Casters. Operation of the furnaces is for 24 hours per day, 365 days per year.

The Granite City Steel mill is located in Madison County, Illinois. The largest city near the facility is St. Louis, which is located approximately 15 kilometers southwest of the Granite City steel mill. The latitude and longitude of the mill are approximately 38:41:55 and 90:08:42. The facility occupies approximately 1,100 acres of land in an area primarily used for industrial and agricultural purposes. A site location map is provided in **Figure 1-1**. A site map is provided in **Figure 1-2**. There are no listed federal Prevention of Significant Deterioration (PSD) Class I areas located within 100 km of the project site.

1.2 RECENT PERMITTING HISTORY

Granite City Steel obtained a permit from Illinois EPA in January 1994 to increase the production rate of Blast Furnaces to 6,500 net tons per day and Basic Oxygen Furnaces to 7,600 net tons per day. The permitted production rate for the continuous caster remained at 6,900 net tons per day (permit #119813AAI dated January 4, 1994).

1.3 APPLICATION INFORMATION

The applicant for this project is as follows:

Granite City Division of
National Steel Corporation
20th and State Streets
Granite City, Illinois 62040

SR 1953

The applicant contact is Mr. Larry Siebenberger. Mr. Siebenberger may be contacted at (618) 451-3391.

The Granite City Division of National Steel Corporation proposes to increase production from their two blast furnaces, two basic oxygen furnaces, and two continuous casters. The production increases proposed in this application are as follows:

- Increase the blast furnaces' production from 6,500 net tons per day (NTPD) to 9,100 NTPD
- Increase the Basic Oxygen Furnaces' production from 7,600 NTPD to 10,300 NTPD
- Increase the continuous casters' production from 6,900 NTPD to 10,300 NTPD

Based on an analysis to determine the net emissions changes resulting from the proposed project, the production increase would result in a net increase of sulfur dioxide (SO_2), carbon monoxide (CO), nitrogen oxides (NO_x), total suspended particulate matter (TSP), volatile organic material (VOM), and lead (Pb) emissions. Emissions of particulate matter less than 10 microns in diameter (PM_{10}) would decrease as a result of the production increase.

The Granite City facility is located in an area that is designated as attainment for SO_2, CO, and Pb and nonattainment for ozone (including NO_x and VOM) and particulate matter (including TSP and PM_{10}). The net emission increases for SO_2 and CO are in excess of the applicable Prevention of Significant Deterioration (PSD) significance levels of 40 and 100 tons per year, respectively. Therefore, the proposed increase in production is considered a major modification requiring a Best Available Control Technology (BACT) analysis. The net emission increases for Pb and the nonattainment pollutants are all below the PSD and new source review (NSR) significance levels. Therefore no additional control technology analyses for these pollutants are necessary.

Related to the production increase, the amount of fuel used by the boilers at the mill may also increase. However, the increase in fuel use by the boilers will not bring total fuel use

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

to an amount greater than allowed by Granite City Steel's existing permits. Also, the fuels types used by the boilers will not change. Therefore, the boilers are not considered part of the major modification and are exempt from BACT review as specified in the federal regulations at 40 CFR 52.21(b)(2)(iii). Increases in emissions due to increased fuel use will, however, be included in the air quality modeling analysis for this application.

It should also be noted that the actual increase in the use of blast furnace gas can only be estimated at this time. This is because actual operation of the blast furnaces at the proposed production level is needed to determine the actual increase in the blast furnace gas generated. Granite City Steel has estimated the increase in blast furnace gas for this application and is confident that the total emissions associated with this fuel for the production increase will be no greater than that represented in this application. Depending on the actual fuel mix and steam demand that accompanies the production increase, Granite City Steel may consider replacement of some existing boilers or modifications to existing boilers to more efficiently use blast furnace gas which would otherwise be flared. Again, these boiler changes would not adversely affect the total emissions associated with the fuel mix. Such changes, if they appear prudent, will be discussed with IEPA prior to implementation.

SR 1955

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

2.0
PROCESS DESCRIPTION

2.1 GENERAL DESCRIPTION OF THE MILL

The Granite City Division of National Steel Corporation owns and operates an integrated steel mill in Granite City, Illinois. Integrated steel manufacturing involves raw material preparation, iron production, iron preparation, and steel production.

2.2 GENERAL PROCESS DESCRIPTION

In this mill, iron is produced in blast furnaces by reducing iron bearing material with a hot gas. The charge, consisting of iron ore, coke, limestone, and other materials, is heated to a temperature above 900°C in the blast furnace. Air heated from 870°C to 1100°C is blown through tuyeres into bottom of the furnace. Oxygen in the air reacts with coke, forming carbon monoxide, which in turn reduces the iron oxides in the ore to iron. Limestone and other fluxs in the charge combine with the sulfur in the charge to form sulfates, which float to the top of the mix and are removed in the slag. A trace amount of sulfur is present in the blast furnace gas as it exits due to the reactions and oxidation taking place in the furnace. Molten iron and slag, accumulated in the hearth of the furnace, are drained into a trough equipped with a skimmer and a dam, resulting in the separation of molten iron from the slag.

The molten iron is further desulfurized by injecting a desulfurization reagent through a lance into the hot metal in the torpedo car using a carrier gas. This process is conducted in a desulfurization station located inside the BOF shop. The constituents of this reagent are typically CaC_2 which desulfurizes the molten metal, and $CaCO_3$ which provides the CO_2 gas required to mix the metal with the desulfurization agent. This treatment can reduce the sulfur content of the metal to less than 0.005%. Sulfur in the molten metal reacts to form calcium sulfate compounds, which are skimmed off the molten metal as slag. A collection hood collects emissions from the desulfurization process.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

The basic oxygen furnace receives a charge composed of approximately 30% metal scrap and 70% molten iron. High purity oxygen is injected below the surface of the molten metal converting it into molten steel. Limestone is added to the charge to form a slag to capture the oxidation products.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

3.0
EMISSION INFORMATION AND NETTING ANALYSIS

3.1 EXISTING AND PROPOSED EMISSION RATES

Emission rates used for calculation of pollutant emissions from the Blast Furnace, BOF and Continuous Casters are based on published emission factors, laboratory analysis, and emission test results.

Fuel related emissions increases related to the proposed production increase were based on use of the following emission factors listed on the following pages. Emission factors for process related emissions are based on published emission factors or, where appropriate, stack test results.

Stack test results used in the analysis include:

- August, 1993 test at BOF Electrostatic Precipitator Stack (PM, NO_x, CO)
- July, 1993 test at Blast Furnace Iron Spout Baghouse (SO_2)
- July, 1993 test at Blast Furnace Casthouse Baghouse (PM, SO_2, NO_x, VOC)

FUEL RELATED EMISSION FACTORS

3.2 REGULATORY ANALYSIS

The proposed modification at the Granite City mill will be subject to both state and federal requirements. Illinois has promulgated air pollution control requirements which apply to both existing and new facilities. The source is subject to the requirements of the Prevention

of Significant Deterioration (PSD) regulations. Madison County, where the facility is located is designated moderate nonattainment for ozone and attainment for all other criteria pollutants.

On June 19, 1978, the EPA promulgated regulations governing Prevention of Significant Deterioration of air quality to implement provisions of the Clean Air Act Amendments of 1977. These regulations were changed as a result of the December 14, 1979 decision of the U.S. Court of Appeals for the District of Columbia (Alabama Power Company, et al. vs. Costle). Final rules pursuant to this decision were promulgated on August 7, 1980.

The PSD regulations apply to major sources - i.e., any of the 28 source categories listed in the regulations which emit, or have the potential to emit, more than 100 tons per year of any pollutant subject to regulation under the Clean Air Act, or any other source category which has the potential to emit more than 250 tons per year of any pollutant subject to regulation under the Act. The PSD regulation also applies to the proposed modification of an existing major source, if the emission increase exceeds the significant emission rates defined in the regulations. The proposed production increase will result in an emission increase greater than the PSD significant level of 100 and 40 tons per year for CO and SO_2 respectively. Thus, the proposed modification will be subject to the PSD regulations for CO and SO_2.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

3.3 NETTING ANALYSIS

The Granite City Division of National Steel Corporation intends to increase production at their Blast Furnaces, Basic Oxygen Furnaces, and Continuous Casters. The proposed production level is set out in the following table.

PRODUCTION AREA	PROPOSED PRODUCTION (NTPD)
BLAST FURNACE	9,100
BOF SHOP	10,300
CASTERS	10,300 (liquid steel to the casters)

There will be changes in regulated air pollutants accompanying this increase in production. Production related emission increases and contemporaneous emission changes were calculated in accordance with Illinois Environmental Protection Agency (IEPA) regulations for Construction and Modification of Major Stationary Sources (Part 203).

A baseline period for this analysis was chosen to be the period August 1992 through July 1994. Emission changes (related to the production increase and contemporaneous changes) were calculated for:

- Carbon Monoxide (CO)
- Nitrogen Oxides (NO_X)
- Sulfur Dioxide (SO_2)
- Particulate Matter less than 10 Microns (PM_{10})
- Particulate Matter (TSP)
- Volatile Organic Material (VOM)
- Lead (Pb)

The following conclusions were reached regarding the magnitude of the net emission changes related to the production increase and contemporaneous emissions changes:

POLLUTANT	NET EMISSION CHANGE
Carbon Monoxide	Significant
Nitrogen Oxides	Not Significant
Sulfur Dioxide	Significant
Total Suspended Particulate Matter	Not Significant
Particulate Matter less than 10 Microns	Not Significant
Volatile Organic Material	Not Significant
Lead	Not Significant

On the basis of these results, only carbon monoxide (CO) and sulfur dioxide (SO_2) will be considered further in the New Source Review process. Information contained in this section concerning the net emission changes for the significant pollutants are presented for information only since these pollutants will be considered in the review process.

3.3.1 BASE PERIOD SELECTION AND NETTING PROCEDURE

The first step in the air quality permitting process is a "netting" evaluation. This evaluation is used to determine whether an air quality permit and subsequent New Source Review is needed. The analysis considers the increase in emissions that will accompany the proposed project. The increase is measured against a base period which is typically taken as the actual annual emissions averaged over the 24 most recent months. Other base periods can be established if they can be shown to be more representative of normal source operations.

The base period used for this analysis is August 1, 1992 through July 31, 1994. This period was selected because it represents the most recent available 24 month period consistent with IEPA Regulation 203.104. While this period has been used for this analysis, it should be noted that there was significant downtime related to furnace repairs in 1992 which has the effect of depressing base period production.

Changes in emissions expected as a result of the proposed increase in production were in most cases scaled from the base period average actual annual emission rate based on fuel usage and production rates consistent with the proposed production increase. A factor was developed by dividing the proposed production levels by the base period production levels as shown in the following table. Appendix B contains additional information on the base period production. **Figure 3-1** shows production trends for the mill.

PRODUCTION AREA	AUGUST 1992 - JULY 1994 PRODUCTION (NTPD)	PROPOSED PRODUCTION (NTPD)	RATIO
BLAST FURNACE	5,643	9,100	1.613
BOF SHOP	6,612	10,300	1.558
CASTERS	6,612	10,300 (liquid steel to casters)	1.558

In certain instances where there is an allowable emission limitation, that limitation was used as the basis of calculating the potential emissions levels associated with the proposed production limit increases.

The netting analysis also considers contemporaneous emission changes, both increases and decreases. Contemporaneous changes are defined as changes that have occurred over the past five years.

Particulate Matter (TSP and PM_{10}), Nitrogen Oxides (NO_X), Volatile Organic Material (VOM), Lead (Pb), and Carbon Monoxide (CO) were evaluated.

For each pollutant for which the source is major, the net emission change is compared against significance levels specified in new source review guidelines. If the net changes in emissions that result from the planned project plus contemporaneous changes for any single pollutant exceed the applicable significance level, the project is treated as a major modification of the source. The significance levels applicable for this project are:

Pollutant	Significance Level (tons per year)
Carbon Monoxide	100
Nitrogen Oxides	40
Sulfur Dioxide	40
Total Suspended Particulate	25
Particulate Matter < 10 microns	15
Volatile Organic Material	40
Lead	0.6

The procedures, assumptions, and results are discussed for each pollutant considered.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

3.3.2 POLLUTANT ANALYSES

3.3.2.1 CARBON MONOXIDE

CO emissions that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Continuous Casters
- Boilers 1-12
- By-Products Flare
- BOF Vessels
- Ladle Dryer & Preheater

Table 3-1 presents the estimated increases in CO emissions associated with the production increase. The total increase in CO emissions is 6,514 tons per year.

Based on information provided by Granite City Steel, there have been two projects within the five year contemporaneous time frame which resulted in changes to CO emissions. Appendix C presents information on the emission changing projects.

Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1, 1991	-22.1
Shutdown of Batch Annealing	December, 1991	-1.2
Net Decrease		**-23.3**
Proposed Production Increase	To Be Determined	+6,513.7
Net Emission Change		**+6,490.4**

On the basis of these calculations, the proposed production increase would result in a net CO emission increase in excess of the significance level (100 tpy). Thus the production increase would be classified as a major modification and Prevention of Significant Deterioration review requirements would apply for this pollutant.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

3.3.2.2 NITROGEN OXIDES

Nitrogen Oxides emission sources that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Continuous Casters
- Boilers 1-12
- By-Products Flare
- BOF Vessels
- Ladle Dryer & Preheater
- Caster Molds
- Blast Furnace Casthouse

Table 3-2 presents the estimated increases in NO_X emissions associated with the production increase. The total increase in NO_X emissions is estimated to be 256 tons per year.

Based on information provided by Granite City Steel, there have been two projects within the five year contemporaneous time frame which resulted in changes to NO_X emissions. Appendix C presents information on the emission changing projects.

Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1, 1991	-217.8
Shutdown of Batch Annealing	December, 1991	-8.7
Net Decrease		**-226.5**
Proposed Production Increase	To Be Determined	+256.3
Net Emission Change		**+29.8**

On the basis of these calculations, the proposed production increase would result in a net NO_X emission change below the significance level (40 tpy). Thus the production increase would not require Prevention of Significant Deterioration (for NO_2) or Nonattainment New Source Review (for O_3).

3.3.2.3 SULFUR DIOXIDE

SO_2 emissions that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Continuous Casters
- Boilers 1-12
- By-Products Flare
- BOF Vessels
- Ladle Dryer & Preheater
- Blast Furnace Casthouse

Table 3-3 presents the estimated increases in SO_2 emissions associated with the production increase. The expected increase in SO_2 emissions is 481 tons per year.

Based on information provided by Granite City Steel, there have been two projects within the five year contemporaneous time frame which resulted in changes to SO_2 emissions. Appendix C presents information on the emission changing projects.

Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1, 1991	-0.34
Shutdown of Batch Annealing	December, 1991	-0.04
Net Decrease		**-0.4**
Proposed Production Increase	To Be Determined	+481.04
Net Emissions Change		**+480.6**

On the basis of these calculations, the proposed production increase would result in a net SO_2 emission increase in excess of the significance level. Thus the production increase would

be classified as a major modification and Prevention of Significant Deterioration requirements would apply for this pollutant.

3.3.2.4 PARTICULATE MATTER

Particulate Matter (PM_{10} and TSP) emissions that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Boilers 1-12
- By-Products Flare
- BOF Vessels
- Continuous Casters
- Ladle Dryer & Preheater
- Blast Furnace Process Emission Points
- BOF Shop Process Emission Points
- Continuous Caster Process Emission Points
- Fugitive Emissions from Roads and Materials Handling

Particulate matter emission increases are affected by the types and amounts of fuel used in each process unit that will be affected by the production increase.

Appendix C presents information regarding fugitive emissions changes from roads and materials handling areas. **Figures 3-2, 3-3,** and **3-4** show the road network used in this analysis.

The baseline set of information used is from a 1988 fugitive emission inventory. Based on that information, emissions were scaled to a base period (August, 1992 to July 1994) estimate using the increase in production (16.9%) and then reductions were calculated to reflect road paved or to be paved for credit, and additional proposed controls to paved and unpaved roads.

The specific fugitive dust control program that is proposed in addition to paving includes:

- three times a month spraying of unpaved roads (except when not required because of naturally wet or frozen conditions); and

- daily sweeping of paved roads shown on **Figures 3-2, 3-3, and 3-4.**

Table 3-4 and **Table 3-5** present the estimated changes in PM_{10} and TSP emissions associated with the production increases and fugitive dust controls to roads. The total increase in PM_{10} and TSP emissions is 9 and 27 tons per year, respectively. In both cases, the decrease in emissions are due to reductions in unpaved road fugitive dust emissions, paving of some previously unpaved roads, and sweeping of paved roads.

Based on information provided by Granite City Steel, there have been five projects (in addition to control of fugitive emissions from roads) within the five year contemporaneous time frame which resulted in changes to PM_{10} emissions. Appendix C presents information on the emission changing projects.

Projects considered in calculating the net PM_{10} emission change are listed in the table below.

PROJECT	DATE	PM_{10} EMISSION CHANGE (tpy)
Remove Blast Furnace Slag Spout Hood	January, 1990	+4.9
# 2 Caster Production	December 1, 1990	+11.7
Ingot Teeming Shutdown	April 1, 1991	-22.4
Shutdown of Blooming Mill	April 1, 1991	-3.4
Shutdown of Batch Annealing	December, 1991	-0.2
Net Decrease		**-9.4**
Proposed Production Increase	To Be Determined	+9.4
Net Emissions Change		**0.0**

Projects considered in calculating the net TSP emission change are listed in the table below.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

PROJECT	DATE	TSP EMISSION CHANGE (tpy)
Remove Blast Furnace Slag Spout Hood	January, 1990	+4.9
# 2 Caster Production	December 1, 1990	+11.7
Ingot Teeming Shutdown	April 1, 1991	-22.4
Shutdown of Blooming Mill	April 1, 1991	-3.4
Shutdown of Batch Annealing	December, 1991	-0.2
Net Decrease		**-9.4**
Proposed Production Increase	To Be Determined	+9.5
Net Emissions Change		**+0.1**

On the basis of these calculations, the proposed production increases and additional dust controls will result in a net decrease in PM_{10} and net increase in TSP particulate matter emissions. Because the TSP increase is less than the 25 tons per year significance threshold, the production increase will not trigger Nonattainment New Source Review for PM_{10} or TSP.

3.3.2.5 VOLATILE ORGANIC MATERIAL

The Blast Furnace Casthouse is the primary source of Volatile Organic Material (VOM) emissions increase that would result from the proposed production increase.

Table 3-6 presents the estimated increases in VOM emissions associated with the production increase. The total increase in VOM emissions is estimated at 67.7 tons per year. The increased emissions due to production increases were estimated by increasing 1993 emissions proportionally.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Based on information provided by Granite City Steel, there have been three projects within the five year contemporaneous time frame which resulted in changes to VOM emissions. Appendix C presents information on the emission changing projects.

Projects considered in calculating the net VOM emission change are listed in the table below.

PROJECT	DATE	EMISSION REDUCTION (tpy)
Installation NESHAP Controls Coke By-Product	July, 1991	-31.6
Shutdown of Blooming Mill	April 1, 1991	-0.9
Shutdown of Batch Annealing	December, 1991	-0.3
Net Decrease		**-32.9**
Proposed Production Increase	To Be Determined	+67.7
Net Emissions Change		**+34.8**

On the basis of these calculations, the proposed production increase would result in a net increase in VOM emissions below the applicable significance level of 40 tons per year. Thus the production increase would not require a Nonattainment New Source Review for this pollutant.

3.3.2.6 LEAD

Table 3-7 presents the estimated increases in lead emissions associated with the production increase. The total increase in lead emissions is estimated at 0.48 tons per year. The increased emissions due to production increases were estimated by increasing 1993 emissions proportionally.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

On the basis of these calculations, the production increase results in increased lead emissions less than the 0.6 tons per year significance threshold. Therefore, a PSD Review for this pollutant is not required.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4.0
BEST AVAILABLE CONTROL TECHNOLOGY REVIEW

4.1 REQUIREMENTS AND APPLICABILITY

BACT is defined as an emission limitation based on the maximum degree of reduction of each pollutant subject to regulation which would be emitted from any proposed major stationary source or major modification which the Administrator (on a case-by-case basis, taking into account energy, environmental and economic impacts, and other costs) determines is achievable for such pollutant. BACT limitations must not cause the exceedance of any applicable New Source Performance Standards (NSPS) and/or National Emission Standards for Hazardous Pollutants (NESHAP).

The requirement to conduct a BACT analysis and determination is set forth in Section 165(a)(4) of the Clean Air Act and in federal regulations at 40 CFR 52.21(j). BACT must also comply with all the applicable limits established by the State of Illinois.

BACT is required for each regulated major source pollutant emitted in excess of the significant emission rates. Individual BACT determinations are to be performed for each pollutant subjected to a PSD review emitted from the same emission unit. The BACT determination must also separately address, for each regulated pollutant with a significant emission increase at the source, air pollution controls for each emissions unit or pollutant emitting activity subject to review.

Based on emission estimates for the proposed project, a BACT review is required for both SO_2 and CO control for the proposed project and is presented in the following format:

- BACT procedures
- Control Technology Review
- Previous BACT Determinations
- BACT Conclusion

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Preparation of the BACT analysis included in this document incorporates the most recent "top-down" BACT guidance (EPA, 1990) by United States Environmental Protection Agency (EPA) for PSD permit determinations. That is, for each pollutant, the most stringent emission limit potentially applicable for a given pollutant was considered and then compared to the proposed project to determine its technical and economic feasibility.

When the most stringent technically feasible emission limitation is not selected as BACT, justification must be provided in terms of adverse economic, environmental, or energy impacts. Several other factors may be considered in justification of rejecting more stringent controls, including:

a. A showing that utilizing the control would adversely impact the project's financial viability.

b. A showing that the costs associated with the control are significantly higher for this specific project than for other similar projects that have installed this control system or in general for controlling the pollutant.

c. A showing that those economic considerations outweigh the energy and environmental benefits.

4.2 SO_2 CONTROL TECHNOLOGY REQUIREMENTS AND APPLICABILITY

The sources of SO_2 emissions impacted by the proposed production increases and considered as a part of the BACT review include the blast furnace stoves, the blast furnace casthouse, the ladle dryer preheater and the continuous casters. The increase in iron-making by the blast furnaces may correspondingly increase the production of process blast furnace gas.

4.2.1 INHERENTLY LOWER-EMITTING PROCESSES/PRACTICES

4.2.1.1 Blast Furnace Stoves

The blast furnace stoves will burn increased amounts of blast furnace gas and comparable amounts of natural gas to accommodate the production increase. Due to the low

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

concentrations of SO_2 and other pollutants in blast furnace gas and natural gas, these products are typically thought of as clean burning fuels[1].

Emissions of SO_2 will be impacted by the quantity of fuel required and the sulfur content of the fuel. For example, blast furnace gas has trace amounts of sulfur but is lower in heating value than natural gas or fuel oil. Therefore, it takes a much greater volume of blast furnace gas to provide the same heat energy as these other fuels. The greater volume and respective sulfur concentration must be compared to the lower volumes and respective sulfur concentration for natural gas or fuel oil to determine a lower emitting practice.

Based on fuel data for each type of fuel used, the lowest emitting fuel for SO_2 is natural gas (approximately 6.0×10^{-4} lbs/mmBtu). The next lowest emitting fuel for SO_2 is blast furnace gas (approximately 8.3×10^{-2} lbs/mmBtu). There may be a small increase in fuel oil use associated with the production increase. Fuel oil combustion results in SO_2 emissions of approximately 1.0 lb/mmBtu.

Increased quantities of blast furnace gas will be produced by the blast furnaces with the proposed production increase. If this fuel is not used in the blast furnace stoves or in other combustion sources, it must be flared. Although blast furnace gas is a higher emitting fuel than natural gas, substituting natural gas at the blast furnace stoves would still result in the combustion of the blast furnace gas at the flare. Therefore, combustion of blast furnace gas in the blast furnace stoves is the inherently lowest emitting practice on a plant-wide basis.

4.2.1.2 Casthouse Emissions

As discussed in Section 2.2, SO_2 emissions from iron-making operations are limited by process practices employing limestone and other fluxing agents in the burden. Due to the reducing atmosphere and the fluxes used in the furnace burden to remove impurities, wide ranges of sulfur in the burden are efficiently removed (98+ %), predominately into the slag. Some trace amounts of sulfur are also in the iron. This necessary burden practice of adding limestone and fluxes effectively and effectively reduces SO_2 emissions to trace amounts[4]. No other lower emitting practices are in use in the steel industry[3,4,5].

SR 1975

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4.2.1.3 Ladle Dryer Preheater and Continuous Caster Emissions

The ladle dryer preheater and continuous casters may require an increase in fuel usage as a result of the production increase. However, because natural gas is the only fuel used at these units, the lowest emitting practice is in place and will continue to be employed.

4.2.2 SO_2 CONTROL TECHNOLOGY OPTIONS

There are no add-on SO_2 control technologies currently in use in the steel industry for SO_2 control at blast furnace stoves using process blast furnace gas, or to control SO_2 at the blast furnace casthouse, ladle dryer preheater and continuous casters.

4.2.3 INFEASIBLE OPTIONS - SO_2

The proposed production increases to the blast furnaces will result in increased blast furnace gas generation and require additional fuel combustion in the blast furnace stoves. Blast furnace gas and natural gas are considered clean fuels and are the preferred supplemental fuels for the increased combustion needs based on inherently lower emitting practices.

Blast furnace gas is a low Btu fuel (approximately 80 Btu/cubic feet). Because of its low Btu value, large volumes of blast furnace gas are necessary to produce the required heat energy for the proposed production increases. Because the use of blast furnace gas in some processes is limited by other factors, such as physical limitations of the gas lines and burners, natural gas may also be used as a supplemental fuel. However, the overall quantity of natural gas usage throughout the plant will remain constant.

Blast furnace gas and natural gas typically contains approximately 0.01 and 0.001 percent sulfur (by weight). Based on these low sulfur concentrations, SO_2 reduction using add-on controls is technically infeasible.

4.2.4 SELECTED BACT - SO_2

Based on a review of the BACT/LAER clearinghouse, information obtained from the U.S. EPA Control Technology Group, and literature from the U.S. EPA Office of Air Quality

Planning and Standards, no add-on BACT determination has been made for SO_2 emissions at these sources. Based on the extremely low concentrations of SO_2 in blast furnace gas, control of SO_2 emissions at blast furnace stoves is not practiced in the steel industry[3,4,5].

The combustion of blast furnace gas in the blast furnace stoves to supplement existing fuel combustion is the only feasible option to support the proposed production increases. Therefore, this option is determined as BACT for SO_2.

Sulfur dioxide emissions from the blast furnace casthouse are effectively controlled by the solubility of sulfur containing gases in the liquid iron and the efficiency of fluxing to remove impurities, including SO_2. Based on the low SO_2 concentrations in casthouse emissions, reduction using add-on controls is technically infeasible. SO_2 emissions from the blast furnace casthouse are effectively reduced by using current industry work practices. This option is selected as BACT for casthouse SO_2 emissions.

The use of natural gas in the ladle dryer preheater and continuous casters is the only feasible control option to support the proposed production increases based on inherently lower emitting practices.

4.3 CO CONTROL TECHNOLOGY REQUIREMENTS AND APPLICABILITY

The major sources of CO emissions impacted by the proposed production increases include the blast furnace stoves, the basic oxygen furnaces (BOF), the ladle dryer preheater and the continuous casters. CO emissions may increase as a result of additional process blast furnace firing in the stoves, additional steel production at the BOF and additional fuel requirements at the ladle dryer preheater and continuous casters. A BACT review requires an evaluation of inherently lower-emitting processes/practices and technically feasible add-on controls.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4.3.1 INHERENTLY LOWER-EMITTING PROCESSES/PRACTICES

4.3.1.1 Blast Furnace Stoves

CO formation results from the incomplete combustion of fossil fuels and oxidation of carbon containing materials. The better the combustion practices, the lower the CO formation.

Good combustion practices requires the following elements:

- Proper fuel/air mixture
- Proper mixing
- High temperature

Good combustion practice is the inherently lowest emitting method of controlling CO emissions from combustion sources[2,6].

4.3.1.2 Basic Oxygen Furnaces (BOF)

CO is formed in the BOFs by oxidizing carbon in the molten iron. Because high-purity oxygen is the industry standard for making steel, there is no lower-emitting practice for this source.

4.3.1.3 Ladle Dryer Preheater and Continuous Casters

The ladle dryer preheater and continuous casters may require an increase in fuel usage as a result of the production increase. However, because natural gas is the only fuel used at these units, the lowest emitting practice is in place and will continue to be employed.

4.3.2 CO CONTROL TECHNOLOGY OPTIONS

The following control technologies are currently available to control CO emissions from affected sources.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4.3.2.1 Blast Furnace Stoves

The following add-on control technology options are currently available to control CO emissions from the blast furnace stoves:

- Direct Combustion (flaring)
- Thermal Oxidization
- Catalytic Oxidation

Direct Combustion

Flaring is a combustion control process in which combustible gases are burned in an open flame in the open air using a specially designed burner tip. Completeness of combustion in a flare is governed by flame temperature, residence time in the combustion zone, turbulent mixing, and available oxygen. The major factors affecting flare combustion efficiency are gas flammability, auto-ignition temperature, heating value (Btu/scf), density, and flame zone mixing.

The heating value affects flame stability, emissions, and flame structure. A lower heating value produces a cooler flame that does not favor combustion and is more easily extinguished.

Thermal Oxidizers

Thermal oxidizers refer to any device that uses a flame combined within an enclosed chamber to convert combustible gases to carbon dioxide and water. Thermal oxidizers operate most effectively at temperatures between 1,300 to 1,500°F with a residence time of 0.1 to 0.5 seconds. By raising the temperature, the residence time for complete combustion can be reduced and vice versa. However, temperature is the more important process variable. The removal efficiency for CO is in the range of 90 to 95 percent.

Besides temperature and residence time, the concentration of the pollutant in the gas stream also affects operation of the system. The concentration of the pollutant dictates the amount

of supplemental fuel required. Low concentrations of the combustible gas require increased supplemental fuel usage.

Catalytic Oxidation

Catalytic incinerators employ a bed of active material (catalyst) that facilitates the overall combustion reaction. The catalyst is a substance that speeds up the rate of a chemical reaction at a given temperature without being permanently altered. The use of a catalyst in an enclosed combustor enables oxidation at temperatures in the range of 500 to 600°F. Common catalysts used in catalytic oxidation units are platinum or other metals. The catalysts are placed on an alumina pellet support or honeycomb support. The typical removal efficiency with this type of control is 90 percent.

Certain contaminants contained in the exhaust gas streams will chemically react or alloy with the catalyst and cause deactivation, including most heavy metal compounds. Sulfur is also considered a catalyst poison, but its effect is reversible.

4.3.2.2 Basic Oxygen Furnaces (BOF)

The BOF receives a charge composed of approximately 30 percent scrap and 70 percent molten iron and converts it to molten steel by utilizing a jet of high purity oxygen. The oxygen oxidizes the carbon and silicon in the molten iron, removes them, and provides heat for melting scrap.

Two primary systems for hooding and combustion of the BOF gases are currently used. The following control technologies are currently available and in use to control CO emissions from BOF vessels.

- Closed-hood combustion with exhaust stack flare
- Open-hood combustion with no additional controls

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Closed-Hood Combustion w/Flare

A closed hood system suppresses combustion at the hood and collects the gases for combustion of CO at an exhaust stack flare. In a closed-hood system movable skirts seal the top of the furnace to limit air induction. Suppressed combustion hoods discourage air infiltration, with as low as 5 percent theoretical air. By suppressing combustion, the CO concentration is increased and the gases are more easily flared.

Open-Hood Combustion

Open combustion hoods allow excess air to be introduced in quantities up to 300 percent. With open hoods there is a gap between the hood and the furnace top into which air can be induced. In an open-hood system CO gases are combusted in the primary hood system with the addition of the excess air.

4.3.2.3 Ladle Dryer Preheater and Continuous Casters

There are no add-on CO control technologies currently in use in the steel industry for CO control at the ladle dryer preheater or continuous casters.

4.3.3 INFEASIBLE OPTIONS - CO

Low concentrations of CO are not effectively and efficiently controlled by emissions control devices[8]. Due to the low concentrations of CO gas in the exhaust stream of the blast furnace stoves, which are below the lower explosive limit (LEL) of 12.5 percent for CO, sustained combustion (flaring) cannot occur[7] without the use of a supplemental fuel. Because the use of supplemental fuel at the flare would result in higher emissions of other pollutants and the formation of additional CO, this is an infeasible option.

The Granite City facility is already equipped with an open hood system on the BOFs where CO is combusted in the hood. Switching to a closed-hood system would require a large capital expense and would be economically infeasible. The residual CO from open-hood combustion is at a concentration level that is not technically feasible to treat further.

SR 1981

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4.3.4 SELECTED BACT - CO

A review of BACT/LAER Clearinghouse, U.S. EPA Control Technology Group, and U.S. EPA Office of Air Quality and Planning literature was conducted to determine the current BACT status for sources within the steel industry. Based on this review and the previous evaluation of BACT options, the following BACT determinations for CO were made for sources impacted by the proposed production increases.

4.3.4.1 BACT - Blast Furnace Stoves

BACT literature indicates that blast furnace stoves at steel mills are not using add-on control equipment for CO emissions control. CO emissions can be adequately controlled by the use of good combustion practices. Therefore the BACT recommendation for control of CO emissions from the blast furnace stoves is the maintenance of good combustion practices.

4.3.4.2 BACT - Basic Oxygen Furnaces (BOF)

The open hood system used by Granite City Steel is a process control with the CO being combusted in the hood system. This type of process does not use add-on controls. After combustion in the open hood system, the CO average concentration is approximately 2500 ppm. This concentration is too low for additional CO control to be technically feasible[8]. Therefore, the existing open hood system, operated in the manner necessary to produce a quality product, is determined to be BACT for the BOFs.

5.0
AIR QUALITY IMPACT ASSESSMENT

5.1 BACKGROUND

The proposed production increases at National Steel Corporation's Granite City Steel mill will result in a facility-wide net emission increase of carbon monoxide (CO) and sulfur dioxide (SO_2) of greater than 100 and 40 tons per year, respectively. Therefore, the proposed production increases constitute a major modification to an existing major stationary source, and subject the mill (for the respective pollutants) to the Federal Clean Air Act's (CAA) New Source Review (NSR) process.

The NSR process requires a major stationary source undergoing a major modification to demonstrate that the modification will not cause or contribute to an exceedance of the National Ambient Air Quality Standards (NAAQS). NSR also requires the source to demonstrate that emissions of specific attainment air pollutants will not deteriorate the existing air quality above incremental amounts established by the CAA. Federal and state regulations have been developed to meet the requirements set forth in the CAA.

The Prevention of Significant Deterioration (PSD) program is a part of the NSR process that states have implemented for major new and modified sources of air pollution, in regions currently in attainment the NAAQS. An air quality impact assessment is one of the requirements which must be conducted in order to receive a PSD permit to construct or modify a source. This section will address the air quality impact assessment requirements which are necessary to receive a PSD permit. The air quality analyses presented in this section satisfy the regulatory requirements given in the Code of Federal Register 40 CFR 52.21(k) and 40 CFR 52.21(m).

Once source and pollutant applicability have been determined, dispersion modeling is typically used to estimate potential ambient pollutant impacts from a major modification. Initially, only the incremental emission increases resulting from the major modification are modeled. If the impacts from these emissions exceed the CAA's ambient significance levels, a more refined modeling analysis must be conducted to demonstrate overall compliance with

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

NAAQS and PSD increments. **Table 5-1** provides the ambient significance levels for CO and SO_2 impacts. **Table 5-2** presents the CO and SO_2 NAAQS (The Illinois Ambient Air Quality Criteria Pollutant Standards are identical to the NAAQS). **Table 5-3** lists the applicable Class II PSD SO_2 increments.

Another set of ambient impact limits which are applicable to PSD reviews are the de minimis ambient monitoring concentrations given in **Table 5-4**. These concentrations are used to determine whether site specific ambient air monitoring may be required prior to construction or modification. Concentrations greater than the values presented in **Table 5-4** could require preconstruction monitoring for up to a year, however, nearby existing representative monitoring data can often be substituted if available, approved by IEPA, and QA/QC certified according to federal guidelines.

The Illinois Environmental Protection Agency (IEPA) has recently conducted extensive dispersion modeling analyses in and around the Granite City Steel mill. The purpose of this modeling was to demonstrate NAAQS attainment for SO_2 and particulate matter. The IEPA modeling successfully demonstrated NAAQS compliance based on federally enforceable state operating permit (FESOP) SO_2 and PM_{10} emission rates for the Granite City Steel mill. SO_2 emission rates proposed for the production increases are no greater than the proposed FESOP limits. Therefore, NAAQS modeling will not be performed.

IEPA also provided a major portion of the data used in the modeling analyses. Included in the data provided are:

- meteorology (five years surface and upper air);
- receptors (three grid files of varying resolution and coverage);
- stack parameters; and
- downwash and wake effect parameters.

5.2 AREA DESCRIPTION

The Granite City Steel mill is located in Madison County, Illinois. Madison County is located in east-central Illinois. The largest city near the mill is St. Louis, Missouri which is located approximately 15 kilometers southwest of the site. The Granite City Steel mill is situated at a surface elevation of approximately 420 feet above mean sea level. The

SR 1985

elevations within a five kilometers radius of the site range from 400 to 430 feet, which are below the stack height elevations of all existing sources at the mill. Therefore, the site is located in an area consisting of simple terrain, and terrain elevations were not included as part of the modeling analyses.

Based on classification systems recognized by the EPA, the project area can be classified as rural. EPA guidance presents two alternative procedures to determine whether the character of an area is predominately urban or rural: 1) land use or 2) population density. The area classification system developed by Auer (1978) was used to classify the area as rural, based on color codes on the USGS maps and population density.

5.3 MODEL SELECTION

A dispersion modeling analysis for the Granite City Steel mill was performed using EPA computer models which evaluate the ambient impact of air pollution sources by simulating the processes of transport and diffusion of effluents in the atmosphere. The procedures recommended by EPA Region V, the Illinois Environmental Protection Agency (IEPA), and the *Guideline on Air Quality Models* (Revised), (EPA-450/12-78-027R) were followed for the modeling analysis.

The revised Industrial Source Complex Short Term (ISCST2) model, version 92062 was selected to predict ambient concentration increases. The ISCST2 model is frequently used in PSD modeling analyses and has gained wide acceptance by the modeling community since options are available to depict emission rate scalars, particle size data, building wake effects and downwash, cavity effects, and various types of emission sources.

The ISCST2 model is a steady-state Gaussian plume model designed to estimate ground-level pollutant concentrations from a wide variety of sources associated with an industrial complex in an area having simple terrain. The ISCST2 model utilized the regulatory default options including the following:

- final plume rise;
- stack-tip downwash;
- buoyancy-induced dispersion; and
- no calms processed

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5.4 METEOROLOGICAL DATA

The dispersion modeling analysis was performed using five years (1982-86) of hourly surface meteorological data from the St. Louis International Airport (No. 13994) and twice-daily upper air meteorological data from the Salem Regional Airport (No. 03879). The meteorological data was recommended and supplied to Granite City Steel by the IEPA, and was previously used to conduct dispersion modeling analyses for SIP NAAQS attainment demonstrations. These data were received from IEPA in a preprocessed binary format compatible with the requirements of the ISCST2 model. The meteorological data consisted of hourly observations for the following parameters:

- Wind speed
- Wind direction
- Ambient temperature
- Atmospheric stability
- Mixing heights

These data were used to calculate hourly plume rise and pollutant concentrations at downwind receptor locations for averaging periods of up to a year. Each year was processed individually and maximum predicted concentrations for the worst-case year are reported in the modeling results.

The St. Louis Airport is located approximately 25 kilometers west of the mill and the Salem Regional Airport is located approximately 100 kilometers east of the mill. Both data sets are considered representative of the meteorological conditions in Madison County, Illinois.

5.5 RECEPTORS

The five-year dispersion modeling analysis utilized three IEPA generated UTM cartesian receptor grids with varying spacings (1 to 1,000 meter) and coverage. Potential near-source impacts due to downwash and wake effects were assessed utilizing fenceline receptors generated by IEPA and incorporated into three grids provided. Since terrain elevations are fairly constant, the modeling analysis was performed using only simple terrain (no terrain elevations). A copy of the receptor grid files are provided in Appendix E.

SR 1987

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5.6 PRECONSTRUCTION AMBIENT AIR QUALITY MONITORING

Preconstruction monitoring of the air quality in the area near a proposed major modification is required by the PSD regulations to determine existing background pollutant concentrations prior to evaluating the impacts of the proposed major modification. The PSD regulations stipulate preconstruction monitoring is required if the maximum predicted (modelled) ambient impact concentration exceeds the de minimis PSD monitoring threshold. However, in lieu of a preconstruction monitoring requirement, the IEPA can designate existing representative monitoring data from a nearby site, if available, and if QA/QC certified according to federal guidelines.

The IEPA monitors CO in Madison County at 2001 Edison Street. This location is approximately 3 blocks (<0.5 kilometers) northwest of the Granite City Steel mill. This location should be considered nearby and representative of background conditions at the site. Therefore, preconstruction monitoring should not be necessary.

The IEPA monitors SO_2 in Madison County at four locations. The nearest monitoring station to the Granite City Steel mill is located in South Roxanna. This monitoring station is approximately 16 kilometers northeast of the Granite City Steel mill. However, because IEPA has already conducted extensive NAAQS SO_2 modeling and determined compliance for the area based on this modeling (at least in-so-far as it relates to the Granite City Steel mill), preconstruction monitoring should not be necessary.

The 1993 Illinois Annual Air Quality Report states that the maximum 1-hour CO average was 8.0 parts per million (9,200 $\mu g/m^3$) and the maximum 8-hour CO average was 3.7 parts per million (4,255 $\mu g/m^3$). These levels are below the 40,000 and 10,000 $\mu g/m^3$ 1-hour and 8-hour NAAQS, respectively.

The 1993 Illinois Annual Air Quality Report states that the maximum 3-hour SO_2 average was 0.171 parts per million (447 $\mu g/m^3$), the maximum 24-hour SO_2 average was 0.063 parts per million (164 $\mu g/m^3$), and the annual SO_2 average was 0.011 parts per million (28.6 $\mu g/m^3$). These levels are below the 1,300, 365, and 80 $\mu g/m^3$ 3-hour, 24-hour and annual NAAQS, respectively.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5.7 SOURCE DATA

The proposed production increases at the Granite City Steel mill will be achieved utilizing existing production equipment. Therefore, only the total emissions from the existing source points will change. The source parameters (stack height, temperature, etc.) are expected to remain the same.

The source data for the SO_2 and CO sources impacted by the proposed production increases are presented in **Table 5-5**. The primary source points at the mill are the blast furnace stoves, boilers, baghouse, the ladle preheater/dryer stacks, the blast furnace casthouse and roof vents, the iron spout baghouse vent and the continuous caster stacks. The ladle preheater/dryers were assumed to exhaust through a single stack for this modeling analysis.

5.8 MODELING PROTOCOL

The dispersion modeling analysis was conducted in three steps. Initially, worst-case individual impacts were determined by modeling each source individually for the five year period. From this modeling, a worst-case combined impact was determined by adding together all individual worst-case impacts regardless of time period (within an averaging period) or receptor location. If this process demonstrated that the combined impacts were below the CAA ambient significance levels, NAAQS levels or applicable PSD Class II increments, no further analyses were conducted. If, however, the combined impacts were calculated to be above the NAAQS levels (with background levels included) or PSD Class II increments, a refined modeling analysis (taking into account the same time period and receptor locations) was performed to evaluate the specific combined impact cases which appeared to exceed the NAAQS or PSD increments.

5.8.1 INDIVIDUAL IMPACT MODELING

To determine the individual worst-case impacts, a Chi/Q modeling analysis was conducted utilizing a nominal emission rate of one gram per second for each source. Once the modeling was completed, the applicable emission rates "Q" (in grams per second) for each individual source were multiplied to the Chi/Q impacts and the worst-case individual source impacts were determined.

For example, the maximum eight-hour Chi/Q impact from the basic oxygen furnace (BOF) for the five year modeling period was 4.3226 $\mu g/m^3$ (1983). Multiplying this impact to the 174.12 gram per second increase in CO emissions from the proposed production increases to the BOF results in a maximum eight-hour CO impact of 752.65 $\mu g/m^3$.

5.8.2 COMBINED IMPACT MODELING

Once the individual worst-case impacts were determined, the next step was to evaluate the worst-case combined impacts. To achieve this, it was first necessary to separate the combustion sources from the process sources.

Combustion sources (in this assessment) are defined as sources that burn fuels for the sole purpose of generating steam or thermal energy. These sources can be used interchangably, that is, fuel burned in one source can be switched immediately to a different source. Therefore, to determine the worst case impacts from the combustion sources (and to maximize operating flexibility), the total emissions from all additional fuel combustion were applied to each combustion source, and the combustion source that was determined to have the highest impact (Boiler 12) was used in the combined impact analysis.

The worst-case combustion source impacts (Boiler 12) were then added to the worst-case individual process source impacts to arrive at a combined worst-case impact. These impacts were then compared to the CAA's ambient significant impact levels. If the significant impact levels were exceeded, the combined impacts were compared to the applicable NAAQS or PSD Class II increment. If the NAAQS or PSD Class II increments were exceeded, additional modeling was required.

5.8.3 REFINED MODELING

If the worst-case combined impacts were greater than the NAAQS (CO) or the PSD Class II increments (SO_2), refined modeling was necessary. Since IEPA has already conducted extensive modeling to demonstrate SO_2 NAAQS compliance, this modeling was not repeated.

Refined modeling combines sources into a single modeling run and evaluates the combined impacts of these sources on particular receptor locations and at particular time periods. This

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

modeling typically results in much lower combined impacts because it is likely that two or more sources are not impacting on the same receptor point at the same time.

5.9 MODELING RESULTS

The results of the dispersion modeling indicate that the proposed production increases will not cause or contribute to a violation of a NAAQS, or cause an exceedance of an applicable PSD Class II increment.

5.9.1 SIGNIFICANT IMPACT DETERMINATION

As described in Section 5.9.1, individual Chi/Q modeling was conducted for all CO and SO_2 sources impacted by the proposed production increases. **Table 5-6** gives the CO modeling results, and **Table 5-7** gives the SO_2 modeling results.

The worst-case combined 1-hour impact levels for CO are 1,730.2 $\mu g/m^3$. This impact is less than the applicable significant impact level of 2,000 $\mu g/m^3$. However, the worst-case combined 8-hour impact level for CO was 798.0 $\mu g/m^3$, which is greater than the 500.0 $\mu g/m^3$ applicable significant impact level. Therefore, the CO impacts are considered significant and require further evaluation for NAAQS compliance.

The worst-case combined 3-hour, 24-hour and annual impacts for SO_2 are modeled to be 233.3, 120.5 and 13.8 $\mu g/m^3$, respectively. These impacts are greater than their respective 25, 5 and 1 $\mu g/m^3$ applicable significant impact levels. Therefore, the SO_2 impacts are also significant and require further evaluation for PSD Class II increment consumption.

5.9.2 NAAQS DETERMINATION - CO

Table 5-8 presents the worst-case individual and combined modeling results for all CO sources at the Granite City Steel mill. Based on these modeling results, the worst-case combined 1-hour impacts from the Granite City Steel sources is 5,095.3 $\mu g/m^3$. If a representative background concentration of 9,200 $\mu g/m^3$ is added to this impact, the total worst-case 1-hour impact is 14,295.3 $\mu g/m^3$. This impact is below the NAAQS of 40,000

$\mu g/m^3$, therefore, the production increase does not cause or contribute to a 1-hour CO NAAQS exceedance.

Based on the modeling results, the worst-case combined 8-hour impacts from the Granite City Steel sources is 2,291.3 $\mu g/m^3$. If a representative background concentration of 4,255 $\mu g/m^3$ is added to this impact, the total worst-case 8-hour impact is 6,546.3 $\mu g/m^3$. This impact is below the NAAQS of 10,000 $\mu g/m^3$, therefore, the production increase does not cause or contribute to a 1-hour CO NAAQS exceedance.

5.9.3 PSD CLASS II INCREMENT CONSUMPTION - SO_2

SO_2 increment is consumed by sources in a specific area that increase their emission of SO_2 after the SO_2 baseline date has been established for that area. The increment can be expanded in a similar fashion if sources in a specific area decrease their SO_2 emissions after the baseline date. Based on data provided by IEPA, the SO_2 baseline date was established for the Kilngas - Wood River Gas Turbine project in December 1982. This project was eventually cancelled. Since this time, two additional PSD projects that would have been potential SO_2 increment consumers were proposed and ultimately cancelled.

IEPA and Granite City Steel were unable to identify the number and magnitude of minor source increment changes that have occurred since 1983. However, SO_2 monitoring data for Madison County indicate that SO_2 concentrations are remaining constant or trending downward. Therefore, we can conclude that at least the full Class II PSD increments for SO_2 should be available.

Table 5-9 presents the worst-case individual and combined modeling results for all SO_2 sources affected by the proposed production increases at the Granite City Steel mill. Based on these results, the worst-case combined impacts are below the 3-hour and annual Class II increments of 512 and 20 $\mu g/m^3$, respectively but exceed the 24-hour Class II increment of 91 $\mu g/m^3$.

To further evaluate the 24-hour average combined SO_2 impacts from the Granite City Steel sources, refined modeling was performed. The refined modeling evaluated the impacts of each individual combustion source combined with the three process sources (A&B Blast

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Furnace Casthouse, A&B Blast Furnace Uncaptured Roof Fugitives, and the Iron Spout Baghouse). A total of seven modeling runs were made to evaluate these combinations:

- Blast Furnace Stove A + 3 process sources;
- Blast Furnace Stove B + 3 process sources;
- Boiler House 1 (Boilers 1-7) + 3 process sources;
- Boiler House 1 (Boilers 8-10) + 3 process sources;
- Boiler 11 + 3 process sources;
- Boiler 12 + 3 process sources; and
- By-products flare + 3 process sources

Table 5-10 presents the summary results of the refined modeling analyses. The results show that the maximum combined 24-hour SO_2 impact of 86.1 $\mu g/m^3$ is less than the Class II increment of 91 $\mu g/m^3$.

6.0
ADDITIONAL IMPACT ANALYSIS

The additional impact analysis required under 40 CFR 52.21(o) are the following:

1. Impacts on soils and vegetation that would result from the modification

2. Air quality and visibility impact on Class I areas within 100 km

3. Impacts on endangered species

4. Socioeconomic analysis

The air quality modeling projections performed in Section 5.0 have demonstrated that the proposed modification will not cause or contribute to an exceedance of the applicable National Ambient Air Quality Standard (NAAQS) or cause an exceedence of a PSD Class II increment. The same can be said for any other anticipated effects that the proposed modification might have upon the surrounding areas of Madison county. Although the source impact analysis is a quantitative, mathematical determination evaluated in relative numerical terms, other impact analyses are generally more qualitative and descriptive in nature. The following sections summarize those additional considerations and demonstrate in each case that the proposed modification will produce no adverse effects.

CLASS I AREA IMPACTS

The nearest Federal Class I area to the Granite City Steel mill is the Mingo National Wilderness Area which is approximately 210 km southwest of the mill. The next closest Class I area (Hercules-Glades) is about 330 km southwest of the mill. The distance from the Class I area to the mill is greater than 100 km; therefore no air quality impact analyses were performed to evaluate impacts within the wilderness area.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

VISIBILITY IMPACT ANALYSIS IN CLASS I AREAS

The Clean Air Act Amendments require evaluation of new emission sources to determine potential impact on visibility in Class I areas. Mandatory Class I areas include international parks, national wilderness areas, national memorial parks and other areas redesignated to Class I areas by the state. The nearest Class I area is the Mingo National Wilderness Area in Popular Bluff, Missouri, located approximately 210 km south-west of Granite City mill.

The current regulation governing PSD review addresses the prevention of visibility impairment in federal Class I areas. No visibility impact analysis for the Class I area was performed, as the nearest Class I area is more than 200 km from the Granite City mill and no impact is expected.

SOILS AND VEGETATION ANALYSIS

Soils and vegetation analysis applies only to those areas in which there is vegetation of significant commercial or recreational value. There are no vegetation or soil types in Granite City area which would be harmed by concentrations of criteria pollutants below the national ambient air quality standard. Therefore, no soils or vegetation analyses are required for the proposed modification.

IMPACTS ON ENDANGERED SPECIES

No impacts will occur to any listed endangered or threatened species, since none are known or likely to occur in the project area.

SOCIOECONOMIC ANALYSIS

The proposed modification at the Granite City mill will have a positive ecomonic impact for the company and therefore for the community surrounding the mill. The infrastructure surrounding the mill is already established due to the existing industrial nature of the area. Therefore, it is not anticipated that there will be secondary air quality impacts due to the increase in production.

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct a sulfur dioxide compliance test program on the Blast Furnace Iron Spout Baghouse exhaust stack on July 1, 1993.

Methodology

Sampling was conducted following USEPA Methods 1-4 and 6 as detailed in the Code of Federal Regulations, CFR40, Part 60, 1992 and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from two 3" diameter test ports located on on the stack exhaust. The test ports were located eight diameters downstream and two diameters upstream from the last flow disturbances. The stack diameter at this sampling location was 82 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 8 points on two traverses for a total of 16 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas CO_2, O_2 and N_2 Content (USEPA Method 3)

The stack gas molecular weight was determined following EPA Method 3. Gas samples were collected in a 60 liter Tedlar bag using ARI's integrated bag collection system and analyzed for CO_2, O_2 and N_2 (by difference) using a Hays Orsat type gas analyzer after each sampling run.

Stack Gas Moisture Content (USEPA Method 4)

Moisture sampling was conducted simultaneously with the sulfur dioxide sampling per USEPA Method 4 using large EPA Method 5 impingers.

Sulfur Dioxide Determination (USEPA Method 6)

Sulfur dioxide sampling was conducted in accordance with EPA Method 6 using large EPA Method 5 impingers.

The first impinger contained 100 mls of 80% IPA to collect SO_3. The second, third and fourth impingers contained 100 mls of 10% hydrogen peroxide. The fifth impinger contained 200 grams of silica gel.

The test repetition times varied with each batch cycle time. The test times were 77, 83 and 67 minutes for runs 1 through 3, respectively.

A final leak check and 20 minute purge were conducted at the completion of each run.

The SO_2 samples were analyzed at ARI's laboratory using standard titrations to a thorin endpoint with barium chloride as specified in EPA Method 6.

Dear Sir:

Subject: July 1, 1993 Blast Furnace Simultaneous Cast Emissions Compliance Test results for the Casthouse and Iron Spout Baghouses.

Attached please find "The Final Report" regarding the July 1st emission test as required by special conditions 4e, g, and h of the Construction Permit for the Blast Furnace and Basic Oxygen Furnace Production Increase (application no. 92090104) for Granite City Division.

Compliance was achieved in accordance with USEPA Methods 1-5, 6, 6c, 7e, 9, and 25a. The attached information indicates the following emissions rates:

BLAST FURNACE CASTHOUSE BAGHOUSE

Emissions Type	Avg. Conc.	Limit
Particulate	.003 gr/dscf	.010 gr/dscf
Sulfur Dioxide	96.1 lbs/hr	n/a
Nitrogen Oxide	6.9 lbs/hr	n/a
VOM (as C_1)	40.6 lbs/hr	n/a

BLAST FURNACE IRON SPOUT BAGHOUSE

Emissions Type	Avg. Conc.	Limit
Sulfur Dioxide	3.5 lbs/hr	n/a

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct an emission compliance test program on the Blast Furnace Cast House Baghouse exhaust stack on July 1, 1993.

The purpose of this formal test program was to determine total particulate, sulfur dioxide (SO_2), nitrogen oxides (as NO_2) and volatile organic compounds (as C_1) emissions over the duration of simultaneous casting operations.

Methodology

Sampling was conducted following USEPA Methods 1-5, 6C, 7E and 25A as detailed in the Code of Federal Regulations, CFR40, Part 60, 1992 and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from four 3" diameter test ports located on the stack exhaust. The test ports were located two diameters downstream and one-half diameters upstream from the last flow disturbances. The stack diameter at this location was 132.0 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 6 points on four traverses for a total of 24 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas CO_2, O_2 and N_2 Content (USEPA Method 3)

The stack gas molecular weight was determined following EPA Method 3. Gas samples were collected in a 60 liter Tedlar bag using ARI's integrated bag collection system and analyzed for CO_2, O_2 and N_2 (by difference) using a Hays Orsat type gas analyzer after each sampling run.

Stack Gas Moisture Content

Moisture sampling was conducted simultaneously with the particulate sampling in the back half of the Method 5 sampling train per USEPA Method 4.

Stack Particulate Sampling Train

The particulate sampling train used during the test series was an Andersen Samplers, Incorporated Method 5 sampling train. The major components are described below:

1. Nozzle - Type 316 stainless steel with sharp tapered leading edge.

2. Probe - Heated glass lined probe with attached pitot tube and stack temperature thermocouple connected to a heated filter holder.

3. Andersen Samplers, Incorporated Sample Case and Control Module - as per EPA Method 5 test specifications.

Sampling Train Assembly

The sample train was assembled as follows:

1. A stainless steel nozzle was selected, sized to maintain isokinetic sampling and attached to the heated glass lined probe.

2. A preweighed filter was placed in the filter holder and its number noted on the data sheets.

3. 100 mls of deionized distilled water was placed in the first and second impinger.

4. The third impinger was assembled dry.

5. 200 grams of dry silica gel was placed in the fourth impinger.

6. The clean glassware and entire sampling train was then assembled at the sampling location.

Sampling Train Leak Check Procedures (Pre and Post)

1. The pump was started.

2. The course flow adjustment valve was opened.

3. Flow through the dry gas meter was checked.

4. The probe inlet was plugged.

5. The fine flow adjustment valve was adjusted to yield a vacuum gauge reading of 15 in Hg.

6. If the flow exceeded .02 ACFM, the pump was shut off and all connections were rechecked for tightness and the leak test procedure was repeated until acceptable results were obtained.

Pitot Tube Leak Check Procedure

1. A positive (or negative) pressure was created in the pitot line to be checked.

2. The line was then plugged to hold the pressure and the magnehelic gauge was monitored to watch for any change in the manometer fluid level.

3. If the fluid level changed, the system was rechecked for leaks and the leak check procedure was repeated until no leaks were found.

Particulate Sampling Procedure

Crushed ice was added to the impinger compartment, the nozzle was uncapped and the probe was introduced into the stack to the first sampling point. The dry gas meter reading was recorded and sampling was started. At each point, a pitot reading was made and the sampling rate was adjusted using K-Factor calculations which were based on preliminary temperature, pressure and moisture estimates. When sampling at the last point in the port was completed, the pump was turned off and the probe was carefully removed from that port.

Initially the sampling was conducted for 2.5 minutes on each of the 24 points. When the simultaneous casting operation exceeded the time required to complete the full four port sampling run of 60 minutes, sampling was continued for 2.5 minutes per traverse point while traversing the stack in reverse order. The total sampling times were 77, 82.5 and 67.5 minutes for runs 1, 2 and 3 respectively.

A final leak test was performed on the sampling train as previously described. The umbilical cord was disconnected and the sample case and probe were then disassembled.

Particulate Sample Recovery

1. The filter was removed from the heated filter holder and placed in a clean Petrie dish and labeled as Container #1.

2. A brush was used to clean the nozzle and other fittings as required. The acetone washings from the inner surfaces of the nozzle, and upstream portion of the filter holder were collected in a bottle and labeled as Container #2.

3. The contents of impinger #4 were transferred to a clean bottle to be weighed at a later time for moisture content and was labeled as Container #3.

4. The contents of impingers #1, #2, and #3 were placed in a graduated cylinder to measure the total volume of water collected.

Particulate Sample Analysis

1. Container #1 - At ARI's laboratory, the container was opened and placed in a desiccator and allowed to dry to a constant weight. Each filter and any loose matter were then weighed to the nearest 0.1 mg.

2. Container #2 - At ARI's laboratory, the contents of this container were transferred to a tared beaker and allowed to evaporate at room temperature in a fume hood. It was then placed in a desiccator and weighed on an analytical balance to the nearest 0.1 mg.

3. Container #3 - The contents of this container were transferred to a tared beaker and the weight of the silica gel was determined. The difference between this final weight and 200 grams was the total moisture collected by the silica gel.

4. The net weight gain recorded for Containers #1 and #2 were summed to yield the total solid particulates collected.

Sulfur Dioxide Determination (USEPA Method 6C)

Sulfur dioxide sampling was conducted following EPA Method 6C protocols. A Western Research Model 721 ATM Photometric SO_2 monitor was used during the testing. Results were recorded on ARI's data logger and computer system.

ARI's sampling system consisted of a heated probe with in-stack filter in each stack followed by a 3-way calibration valve connected to a heated Teflon sample line connected to a 3-way valve at ground level. The Teflon sample line was connected to an ice-cooled condenser to remove moisture followed by a Teflon lined pump. A sample manifold was connected to the exhaust side of the pump with intake lines for ARI's SO_2 and NO_x monitors.

Certified SO_2 calibration standards and zero air were used to calibrate the monitor. The gas standards were introduced directly into the three way valve at the end of the heated sample probe.

Specifically, gas standards of zero air, 491 ppm and 910 ppm SO_2 in N_2 were used for calibration. The SO_2 monitor span was set at 1000 ppm during the testing.

A pre-test and post-test measurement system bias test and calibration error test was done after each test repetition. The average zero and calibration drift values obtained during each test run on the monitor were used to correct the data for each test run.

Nitrogen Oxides Determination (USEPA Method 7E)

Continuous nitrogen oxides (as NO_2) sampling was conducted following EPA Method 7E. The NO_x monitor used was ARI's TECO Model 10 monitor. Data was recorded on ARI's data logger and computer system. Calibration gas and zero air was introduced directly into the 3-way valve for calibration of the NO_x monitor.

A converter efficiency test and response time test were conducted prior to beginning the testing following EPA Method 20 procedures.

A pre-test and post-test measurement system bias test and calibration error test were performed using certified master gas calibration standards of 57.0 ppm, 142.8 ppm and 217.7 ppm NO_x in N_2. The monitor span was set at 250 ppm. Zero and calibration drift test results were well within 3% of span for each calibration gas. The average zero and calibration drift values obtained during each test run on each monitor were used to correct the data for that test run.

Determination of Total VOC (USEPA Method 25A)

Total volatile organic compounds sampling and analysis were conducted on-site on the stack exhaust using a Ratfisch Model RS-55 Total Hydrocarbon Analyzer. The monitor was calibrated using propane as the VOC standard. The VOC concentration was converted to a C_1 basis using the factor of 3 as listed in USEPA Method 25A. The analyzer utilizes a continuous heated FID which keeps the sample gas stream above its dewpoint.

The sampling systems consisted of the following:

1) Stainless steel probe with instack filter holder.

2) 3-way calibration valve and line located at the probe.

3) Heated Teflon line (>250°F) from the probe to the analyzer.

The Ratfisch analyzer was operated at the following conditions:

Oven temperature	:	150°C
Sample backpressure	:	200 m bar
Air	:	11.5 psi
Hydrogen	:	6.0 psi
Response time	:	30 seconds
Chart speed	:	10 cm/hr
Data logger	:	15 sec. - 1 minute average
Span	:	1000 ppm propane

Zero gas and USEPA protocol 1 certified propane standards in N_2 gas standards were used for calibration of the instrument. The calibration gases were introduced at the 3-way calibration valve located at the end of each sample probe. Calibration gases used were 253.9 ppm, 467.1 ppm and 844.2 ppm propane in N_2.

Emission Calculations

The particulate, sulfur dioxide and nitrogen oxides (as NO_2) emission rates in lbs/hr were calculated for each run by multiplying the measured particulate, sulfur dioxide and nitrogen oxides concentrations (lbs/dscf) by the stack gas volumetric flow rate (dscfh).

The volatile organic compound emission rate in lbs/hr were calculated for each run by multiplying the measured VOC concentration (lbs/scf wb) by the stack gas volumetric flow rate (scfh wb).

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct a formal emission test program on the exhaust stack associated with the electrostatic precipitator serving the basic oxygen furnace on August 27-28, 1993.

Testing was conducted on August 27, 1993 with the fan flow rate set at 650,000 cfm on the electrostatic precipitator. As a result ofa delayed ignition condition which occurred at the beginning of the blow on the second run, a fourth run was conducted.

Testing was conducted on August 28, 1993 with the fan flow rate set at 680,000 cfm. Three sample runs were done at this condition.

Methodology

Sampling was conducted following USEPA Methods 1-5, 7E and 10 as detailed in the Code of Federal Regulations, CFR40, Part 60, 1992 and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from four 3" diameter test ports located on the stack exhaust. The test ports were located two diameters downstream and one-half diameters upstream from the last flow disturbances. The stack diameter at this location was 147.75 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 6 points on four traverses for a total of 24 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas O_2 and CO_2 Determination (USEPA Method 3A)

Continuous oxygen sampling was conducted in accordance with EPA Method 3A using ARI's OFC Infrared Industries Model IR-2000 oxygen monitor. The monitor results were recorded on a strip chart recorder and ARI's datalogger system.

ARI's sampling system consisted of a heated probe with in-stack filter followed by a 3-way calibration valve connected to a heated Teflon sample line. The Teflon sample line was connected to an ice-cooled condenser to remove moisture followed by a Teflon lined pump. A sample manifold was connected to the exhaust side of the pump with intake lines for ARI's O_2, CO_2, NO_x and CO monitors.

Certified gas standards of zero air, nitrogen and 12.1 O_2 in N_2 calibration gases were introduced at the three-way calibration valve located at the end of the sample probe for calibration of the O_2 monitor. The O_2 monitor span was set at 25% during the testing.

Continuous carbon dioxide sampling was conducted using ARI's Horiba NDIR Model 2000 carbon dioxide monitor. The monitor results were recorded on a strip chart recorder and ARI's datalogger system.

Certified gas standards of nitrogen, 8.2 and 12.9 CO_2 in N_2 calibration gases were used to calibrate the monitor. The CO_2 monitor span was set at 15% during the testing.

Stack Gas Moisture Content

Moisture sampling was conducted simultaneously with the particulate sampling in the back half of the Method 5 sampling trains per USEPA Method 4.

Total Particulate Determination (USEPA Method 5)

Particulate emission sampling was conducted using two Method 5 sampling trains in order to complete each sampling run within a specified time frame and to allow continuous sampling throughout a complete emissions cycle without sampling downtime due to sampling port changes.

Sampling was conducted for 1.5 minutes per point at each of 24 points (six points per port and four ports). The sampling rate during each run was adjusted to compensate for the changes in stack gas temperature and moisture content throughout the cycle to maintain isokinetic sampling. The sampling time for each run varied based on the duration of the cycle. The first 36 minutes consisted of initially sampling the 24 points. Backwards traversing was then performed at each point at 1½ minutes per point until the process cycle was completed.

Stack Particulate Sampling Train

The particulate sampling train used during the test series was an Andersen Samplers, Incorporated Method 5 sampling train. The major components are described below:

1. Nozzle - Type 316 stainless steel with sharp tapered leading edge:

2. Probe - Heated glass lined probe with attached pitot tube and stack temperature thermocouple connected to a heated filter holder.

3. Andersen Samplers, Incorporated Sample Case and Control Module - as per EPA Method 5 test specifications.

Sampling Train Assembly

The sample train was assembled as follows:

1. A stainless steel nozzle was selected, sized to maintain isokinetic sampling and attached to the heated glass lined probe.

2. A preweighed filter was placed in the filter holder and its number noted on the data sheets.

3. 100 mls of deionized distilled water was placed in the first and second impinger.

4. The third impinger was assembled dry.

5. 200 grams of dry silica gel was placed in the fourth impinger.

6. The clean glassware and entire sampling train was then assembled at the sampling location.

Sampling Train Leak Check Procedures (Pre and Post)

1. The pump was started.

2. The course flow adjustment valve was opened.

3. Flow through the dry gas meter was checked.

4. The probe inlet was plugged.

5. The fine flow adjustment valve was adjusted to yield a vacuum gauge reading of 15 in Hg.

6. If the flow exceeded .02 ACFM, the pump was shut off and all connections were rechecked for tightness and the leak test procedure was repeated until acceptable results were obtained.

Pitot Tube Leak Check Procedure

1. A positive (or negative) pressure was created in the pitot line to be checked.

2. The line was then plugged to hold the pressure and the magnehelic gauge was monitored to watch for any change in the manometer fluid level.

3. If the fluid level changed, the system was rechecked for leaks and the leak check procedure was repeated until no leaks were found.

Particulate Sampling Procedure

Crushed ice was added to the impinger compartment, the nozzle was uncapped and the probe was introduced into the stack to the first sampling point. The dry gas meter reading was recorded and sampling was started. At each point, a pitot reading was made and the sampling rate was adjusted using K-Factor calculations which were based on preliminary temperature, pressure and moisture estimates. When sampling at the last point in the port was completed, the pump was turned off and the probe was carefully removed from that port.

The two sampling trains were positioned at their respective port locations with the "A" train serving the South and West ports and the "B" train serving the East and North ports.

At the beginning of each cycle, sampling was started in the South port. Sampling was conducted for 1½ minutes at each of six points in the first port. At the completion of nine minutes of sampling, the second sampling train in the East port was immediately started and sampling conducted in the second port identical to the first. This process was repeated for the North and West ports with sampling and traversing continued backwards from the last sample point (24) until the cycle time was completed. Sampling was conducted continuously throughout the entire cycle.

The sampling rate during each run was adjusted to compensate for the changes in stack gas temperature and moisture content throughout the cycle to maintain isokinetic sampling rate at all times.

A final leak test was performed on the sampling train as previously described. The umbilical cord was disconnected and the sample case and probe were then disassembled.

Particulate Sample Recovery

1. The filter was removed from the heated filter holder and placed in a clean Petrie dish and labeled as Container #1.

2. A brush was used to clean the nozzle and other fittings as required. The acetone washings from the inner surfaces of the nozzle, and upstream portion of the filter holder were collected in a bottle and labeled as Container #2.

3. The contents of impinger #4 were transferred to a clean bottle to be weighed at a later time for moisture content and was labeled as Container #3.

4. The contents of impingers #1, #2, and #3 were placed in a graduated cylinder to measure the total volume of water collected.

Particulate Sample Analysis

1. Container #1 - At ARI's laboratory, the container was opened and placed in a desiccator and allowed to dry to a constant weight. Each filter and any loose matter were then weighed to the nearest 0.1 mg.

2. Container #2 - At ARI's laboratory, the contents of this container were transferred to a tared beaker and allowed to evaporate at room temperature in a fume hood. It was then placed in a desiccator and weighed on an analytical balance to the nearest 0.1 mg.

3. Container #3 - The contents of this container were transferred to a tared beaker and the weight of the silica gel was determined. The difference between this final weight and 200 grams was the total moisture collected by the silica gel.

4. The net weight gain recorded for Containers #1 and #2 were summed to yield the total solid particulates collected.

Nitrogen Oxides Determination (USEPA Method 7E)

Continuous NO_x sampling was conducted following EPA Method 7E. The NO_x monitor used was ARI's TECO Model 10 NO_x monitor. Data was recorded on a dual pen strip chart recorder and ARI's datalogger system. Calibration gas and zero was introduced directly into the 3-way valve for calibration of the NO_x monitor.

A converter efficiency test and response time test were conducted prior to beginning the testing following EPA Method 20 procedures.

A pretest and post-test measurement system bias test and calibration error test were performed using certified master gas NO_x calibration standards of 57.0 ppm, 142.8 ppm and 217.7 ppm NO_x. The NO_x monitor span was set at 250 ppm. Zero and calibration drift test results were well within 3% of span for each calibration gas. The average zero and calibration drift values obtained during each test run on each monitor were used to correct the data for that test run.

Carbon Monoxide Determination (USEPA Method 10)

Continuous carbon monoxide sampling was conducted in accordance with USEPA Method 10. A TECO Model 48 Gas Filter Correlation CO monitor was used for CO analysis. Results were recorded out on a dual pen strip chart recorder and recorded on ARI's datalogger system.

Certified CO calibration standards and zero air were used to calibrate the CO monitor. The gas standards were introduced directly into the three way valve at the end of the heated sample probe.

CO calibration standards of 5,750, 8,748 and 18,600 in N_2 were used to calibrate the CO monitor. The CO monitor span was set at 20,000 ppm during the testing.

A pretest and post-test measurement system bias test and calibration error test was done after each test repetition. The average zero and calibration drift values obtained during each test run on the monitor were used to correct the data for that test run.

Emission Calculations

The stack particulate emission rate (lbs/cycle) for each of the sampling runs was determined by summing the particulate emission rates (lbs/run) determined for each of the two sampling trains "A" and "B" used during each sampling run. This combined total represented the total stack particulate emissions for each complete BOF emissions cycle.

The total nitrogen oxides and carbon monoxide emission rates were calculated by summing the stack flow rate for each run and calculating the emission rate (lb/run) by multiplying the total flow rate (dscf/run) by the nitrogen oxides and carbon monoxide concentrations (lb/dscf).

#12 BOILER STACK
GRANITE CITY STEEL DIVISION: GRANITE CITY, ILLINOIS

I. INTRODUCTION AND SUMMARY

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation located ~~in~~ Granite City, Illinois to conduct a nitrogen oxide emission test on the #12 Boiler exhaust stack on November 4, 1992.

The run was completed on November 4, 1992 when the boiler was operating with natural gas.

Test methods followed those as detailed in the Code of Federal Regulations, CFR40, Part 60, Appendix A; and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Testing was conducted boy Mr. M. Barton, Mr. D. Chapman and Mr. E. Kelly of ARI Environmental. Mr. Jeff Blaies of Granite City Steel was present to coordinate the tests and monitor the process conditions.

This report summarizes the test procedures and results of the test. Included, as appendices, is a documentation of all field test data, calculation summary data, strip chart data and logger data.

The results of the test are summarized below:

#12 Boiler (Natural Gas)

#12 BOILER STACK
GRANITE CITY STEEL DIVISION: GRANITE CITY, ILLINOIS

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct a nitrogen oxide emission test on the #12 Boiler exhaust stack November 4, 1992.

Methodology

Sampling was conducted following USEPA Methods 1-4, 6C, 7E and 10 as detailed in the Code of Federal Regulations, CFR40, Part 60, 1991 and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from two 3" diameter test ports located on the stack exhaust. The test ports were located five diameters downstream and five diameters upstream from the last flow disturbances. The stack diameter at this location was 90.5 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 8 points on two traverses for a total of 16 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas CO_2, O_2 and N_2 Content (USEPA Method 3)

The stack gas molecular weight was determined following EPA Method 3. Gas samples were collected in a 60 liter Tedlar bag using ARI's integrated bag collection system and analyzed for CO_2, O_2 and N_2 (by difference) using a Hays Orsat type gas analyzer after each sampling run.

Stack Gas Moisture Content (USEPA Method 4)

Moisture sampling was conducted following EPA Method 4 on the exhaust stack.

Nitrogen Oxides Determination (USEPA Method 7E)

Continuous NO_x sampling was conducted following EPA Method 7E. The NO_x monitor used was ARI's TECO Model 10 NO_x monitor. Data was recorded on a pen strip chart recorder and ARI's data logger system. Calibration gas and zero air was introduced directly into the 3-way valve for calibration of the NO_x monitor.

The average zero and calibration drift values obtained during each test run on each monitor were used to correct the data for that test run.

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct a nitrogen oxide emission test on the #12 Boiler exhaust stack February 1, 1993.

Methodology

Sampling was conducted following USEPA Methods 1-4, and 7E as detailed in the Code of Federal Regulations, CFR40, Part 60, 1992 and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from two 3" diameter test ports located on the stack exhaust. The test ports were located five diameters downstream and five diameters upstream from the last flow disturbances. The stack diameter at this location was 90.5 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 8 points on two traverses for a total of 16 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas CO_2, O_2 and N_2 Content (USEPA Method 3)

The stack gas molecular weight was determined following EPA Method 3. Gas samples were collected in a 60 liter Tedlar bag using ARI's integrated bag collection system and analyzed for CO_2, O_2 and N_2 (by difference) using a Hays Orsat type gas analyzer after each sampling run.

Stack Gas CO_2 and O_2 Determination (USEPA Method 3A)

Continuous carbon dioxide and oxygen sampling was conducted on the exhaust stack in accordance with EPA Method 3A using ARI's Horiba PIR-2000 carbon dioxide analyzer and OFC Infrared Industries Model IR-2000 oxygen monitor. The monitor's results were recorded on ARI's data logger system.

Calibration gas and zero air were introduced directly into the 3-way valve located at the end of the sample probe. The CO_2 monitor span was set at 15% and the O_2 monitor was set at 25% during the testing.

Stack Gas Moisture Content (USEPA Method 4)

Moisture sampling was conducted following EPA Method 4 on the exhaust stack.

Nitrogen Oxides Determination (USEPA Method 7E)

Continuous NO_x sampling was conducted following EPA Method 7E. The NO_x monitor used was ARI's TECO Model 10 NO_x monitor. Data was recorded on a pen strip chart recorder and ARI's data logger system. Calibration gas and zero air was introduced directly into the 3-way valve for calibration of the NO_x monitor.

The average zero and calibration drift values obtained during each test run on each monitor were used to correct the data for that test run.

NO_x EMISSION TEST
#4 SLAB FURNACE
STACK EMISSION TEST
MAY 19, 1992

Introduction and Summary of Results

On March 19, 1992 the exhaust gas from #4 Slab Furnace was tested for NO_x concentration while burning natural gas. Test Methods followed those detailed in the Code of Federal Regulations, CFR 40, Part 60, Appendix A: and the Quality Assurance Handbook for Air Pollution Measurement. System, Volume III, Stationary Source Specific Methods. The results of the test indicate an average emission rate of .393 lb. NO_x per mmbtu.

Overview

In order to determine the NO_x emissions generated during #4 Slab Furnace was fired on natural gas. Based upon the amount of fuel used during the test and the NO_x lb./hr. obtained by testing the NO_x lb./mmbtu are determined.

Test Methodology and Equipment

Sampling was conducted following USEPA Method 7E. The NO_x monitor used was AIR's TECO Model 10 NO_x monitor. Data was recorded on a dual pen strip chart recorder. Calibration gas and zero air was introduced directly into the 3-way valve for calibration of the NO_x monitor.

The average zero and calibration drift valves obtained during each test run on each monitor were used to correct the data for that test run.

Results

Average concentration of NO_x during the tests are as follows:

Run one	= 96.561 lb./hr.
Run two	= 96.256 lb./hr.
Run three	= 100.960 lb./hr.
Average	= 97.925 lb./hr.

Average fuel usage rate = 250.67 mmbtu/hr.

97.925 lb. NO_x/hr./250.67 mmbtu/hr. = 0.393 lb./mmbtu

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct a sulfur dioxide, nitrogen oxide and carbon monoxide test program on the #4 Slab Furnace exhaust stack on March 19, 1992.

Methodology

Sampling was conducted following USEPA Method 1-4, 6C, 7E and 10 as detailed in the Code of Federal Regulations CFR40, Part 60, 1991 and Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from four 3" diameter test ports located on the stack exhaust. The test ports were located three diameters downstream and three diameters upstream from the last flow disturbances. The stack diameter at this location was 180 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 4 points on four traverses for a total of 16 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Temperature measurements were determined using a Chromel-Alumel thermocouple connected to an Omega digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas CO_2, O_2 and N_2 Content (USEPA Method 3)

The stack gas molecular weight was determined following EPA Method 3. Gas samples were collected in a 60 liter Tedlar bag using ARI's integrated bag collection system and analyzed for CO_2, O_2 and N_2 (by difference) using a Hays Orsat type gas analyzer after each sampling run.

SR 2069

Stack Gas Moisture Content (USEPA Method 4)

Moisture sampling was conducted following EPA Method 4 on the exhaust stack.

Sulfur Dioxide Determination - Instrument Method (USEPA Method 6C)

Sulfur dioxide sampling and analyses were performed on a one-hour continuous basis in accordance with USPEA Method 6C.

A Western Research Model 5R UV monitor was used for the testing zero air and calibration gases were introduced into the 3 way calibration valve located at the end of the heated sample probe.

Nitrogen Oxides Determination (USEPA Method 7E)

Continuous NO_X sampling was conducted following EPA Method 7E. The NO_X monitor used was ARI's TECO Model 10 NO_X monitor. Data was recorded on a dual pen strip chart recorder. Calibration gas and zero was introduced directly into the 3-way valve for calibration of the NO_X monitor.

Carbon Monoxide Determination (USPEA Method 10)

Carbon monoxide sampling and analyses were conducted continuously in accordance with USPEA Method 10. A TECO Model 48 Gas Filter Correlation CO monitor was used for CO analysis. Results were printed out on a dual pen strip chart recorder.

Certified CO calibration standards and zero air were used to calibrate the CO monitor which were introduced directly into the three way valve at the end of the heated sample probe.

INSTALLATION OF NESHAP CONTROLS AT COKE BY-PRODUCT PLANT

VOC Emissions Reduction at Coke By-Product Plant after Installation of NESHAPS Controls

It was reported, in Attachment 2 of the October 8, 1991 submittal of additional information in application for modification of Operating Permits for the Granite City Division Emission Reduction Plant Production Increase Project, that the installation of benzene emission controls (NESHAPS) at the Coke By-Product Recovery Plant would provide a reduction of 31.6 TPY VOC other than benzene. The following is a demonstration of the derivation of that VOC emission reduction.

All calculations are based on 1990 coke production of 577,473 tons.

Emission factors are taken from the publication EPA-450/3-83-016a, "Benzene Emissions from Coke By-Product Recovery Plants - Background Information for Proposed Standards." The NESHAPS emission factors contained in this publication are for benzene only. The emissions of other light oil (L.O.) constituents were calculated by taking the ratio of the mole fraction of each L.O. constituent (liquid) times the vapor pressure of that constituent to the mole fraction of benzene (liquid) times the vapor pressure of benzene, then multiplying that ration by the calculated benzene emissions. It is assumed that all emissions are vapors and that the vapors are in equilibrium with the liquid light oil.

Sample calculation:

For the direct water cooling tower, benzene emissions are calculated as follows:

$$(577{,}473 \text{ tons coke}) \times \frac{2000 \text{ lb.}}{\text{ton}} \times \frac{454 \text{g}}{\text{lb.}} \times \frac{1 \text{ Mg}}{10^6 \text{g}} = 524{,}346 \text{ Mg coke}$$

$$\frac{524{,}346 \text{ Mg coke}}{\text{yr.}} \times \frac{270 \text{g}}{\text{Mg}} \times \frac{1 \text{ lb.}}{454 \text{g}} = 311{,}836 \text{ lb./year}$$

where 270g/Mg = uncontrolled benzene emission factor from Table 3 - 7, attached.

From the Light Oil Constituents table, attached,

Benzene: $y(P^\circ) = .71(96) = 68.16$

where .71 = benzene mole fraction
and 96 = benzene vapor pressure

Similarly,

Toluene: $y(P^\circ) = .159(30) = 4.77$

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Hence, the toluene emissions, with no controls, from the direct water cooling tower are

$$\frac{4.77}{68.16} \text{ (311,836 lb/yr.)} = 21{,}823 \text{ lb. toluene/year}$$

Toluene emissions after installation of NESHAPS controls with 100% efficiency are

21,823 lb. toluene (100 - 100) = 0 lb. toluene/yr.

Emission of benzene, toluene, xylene, ethylbenzene and styrene are calculated, as above, for the various emission sources at the By-Product Plant and presented in the table Emissions of Light Oil Constituents after Installation of NESHAPS Controls at the Coke Oven By-Products Plant, attached.

The non-benzene emissions controlled by the NESHAPS project are then calculated, for each light oil constituent considered, by subtracting the total emissions after controls were applied at all sources from the total emissions prior to application of controls at all sources. These calculations are presented in the table entitled Non-Benzene Emissions Controlled by NESHAPS Project, attached.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Non-Benzene Emissions Controlled by NESHAPS Project

	Total Uncontrolled Emissions	-	Total Uncontrolled Emissions after NESHAPS Controls Installed	=				=	
Toluene	59,584	-	997	=	58,587 lbs.	x	1T / 2000	=	29.3 tons/yr.
Xylene	2,871	-	48	=	2,823 lbs.	x	1T / 2000	=	1.4 tons/yr.
Ethylbenzene	959	-	10	=	949 lbs.	x	1T / 2000	=	0.5 tons/yr.
Styrene	868	-	9	=	859 lbs.	x	1T / 2000	=	0.4 tons/yr.
									31.6 tons/yr.

[a] Emissions were estimated on the basis of number of potentially leaking units. Emission factors are listed in Table 3-6.

SHUTDOWN OF BLOOMING MILL - APRIL 1991

Coke oven gas consumed at Soaking Pits, 1,076,926 MMBtu in 1990

The coke oven gas which was consumed at the Blooming Mill Soaking Pits (firing rate 408 MMBtu/hr/furnace) is to be used at the Hot Strip Slab Furnaces (1-3) (firing rate 321.8 MMBtu/hr/furnace) and Slab Furnace 4 (firing rate 495 MMBtu/hr).

The emission reductions for the displaced use of natural gas on the slab reheat furnaces is based on the AIRS 1990 emission factor for natural gas sources greater than 100 MMBtu/hr and the "ACT for NO_x Emissions from Iron and Steel Mills".

1990

Coke Oven Gas Soaking Pits - General (< 10 MMBtu/hr)

44,134 * 0.003 * 1/2000 = 0.066 tpy PM_{10} emission reduction

1.0
DESCRIPTION OF EXISTING MILL

1.1 GENERAL DESCRIPTION OF MILL

The Granite City Division of National Steel Corporation owns and operates an integrated steel mill in Granite City, Illinois. Integrated steel manufacturing involves raw material preparation, iron production, iron preparation, and steel production.

1.2 GENERAL PROCESS DESCRIPTION

In this mill, iron is produced in blast furnaces by reducing iron bearing material with a hot gas. The charge, consisting of iron ore, coke, limestone, and other materials, is heated to a temperature above 900°C in the blast furnace. Air heated from 870°C to 1100°C is blown through tuyeres into bottom of the furnace. Oxygen in the air reacts with coke, forming carbon monoxide, which in turn reduces the iron oxides in the ore to iron. Limestone and other fluxs in the charge combine with the sulfur in the ore to form sulfates, which float to the top of the mix and are removed in the slag. A trace amount of sulfur are present in the blast furnace gas as it exits due to the reactions and oxidation taking place in the furnace. Molten iron and slag, accumulated in the hearth of the furnace, are drained into a trough equipped with a skimmer and a dam, resulting in the separation of molten iron from the slag.

The molten iron is further desulfurized by injecting a desulfurization reagent through a lance into the hot metal in the torpedo car using a carrier gas. This process is conducted in a desulfurization station located inside the BOF shop. The constituents of this reagent are typically CaC_2 which desulfurizes the molten metal, and $CaCO_3$ which provides the CO_2 gas required to mix the metal with the desulfurization agent. This treatment can reduce the sulfur content of the metal to less than 0.005%. Sulfur in the molten metal react to form calcium sulfate compounds, which are skimmed off the molten metal as slag. A collection hood will collect emissions from the desulfurization process.

The basic oxygen furnace receives a charge composed of approximately 30% metal scrap and 70% molten iron. High purity oxygen is injected below the surface of the molten metal converting it into molten steel. Limestone is added to the charge to form a slag to capture the oxidation products.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

2.0
PROPOSED PROJECT

The Granite City Division of National Steel Corporation proposes to increase production from their two blast furnaces, two basic oxygen furnaces, and two continuous casters. Based on an analysis to determine the net emissions changes resulting from the proposed project, the production increase would result in a net increase of sulfur dioxide (SO_2), carbon monoxide (CO), nitrogen oxides (NO_x), total suspended particulate matter (TSP), volatile organic material (VOM), and lead (Pb) emissions. Emissions of particulate matter less than 10 microns in diameter (PM_{10}) would decrease as a result of the production increase.

The Granite City facility is located in an area that is designated as attainment for SO_2, CO, and Pb and nonattainment for ozone (including NO_x and VOM) and particulate matter (including TSP and PM_{10}). The net emission increases for SO_2 and CO are in excess of the applicable Prevention of Significant Deterioration (PSD) significance levels of 40 and 100 tons per year, respectively. Therefore, the proposed increase in production is considered a major modification requiring a Best Available Control Technology (BACT) analysis. The net emission increases for Pb and the nonattainment pollutants are all below the PSD and new source review (NSR) significance levels. Therefore no additional control technology analyses for these pollutants are necessary.

Related to the production increase, the amount of fuel used by the boilers at the mill will also increase. However, the increase in fuel use by the boilers will not bring total fuel use to an amount greater than allowed by Granite City Steel's existing permits. Also, the fuels types used by the boilers will not change. Therefore, the boilers are not considered part of the major modification and are exempt from BACT review as specified in the federal regulations at 40 CFR 52.21(b)(2)(iii). Increases in emissions due to increased fuel use will, however, be included in the air quality modeling analysis for this application.

It should also be noted that the actual increase in the use of blast furnace gas can only be estimated at this time. This is because actual operation of the blast furnaces at the proposed production level is needed to determine the actual increase in the blast furnace gas generated. Granite City Steel has estimated the increase in blast furnace gas for this application and is

confident that the total emissions associated with this fuel for the production increase will be no greater than that represented in this application. Depending on the actual fuel mix and steam demand that accompanies the production increase, Granite City Steel may consider replacement of some existing boilers or modifications to existing boilers to more efficiently use blast furnace gas which would otherwise be flared. Again, these boiler changes would not adversely affect the total emissions associated with the fuel mix. Such changes, if they appear prudent, will be discussed with IEPA prior to implementation.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

3.0
BEST AVAILABLE CONTROL REVIEW

3.1 REQUIREMENTS AND APPLICABILITY

BACT is defined as an emission limitation based on the maximum degree of reduction of each pollutant subject to regulation which would be emitted from any proposed major stationary source or major modification which the Administrator (on a case-by-case basis, taking into account energy, environmental and economic impacts, and other costs) determines is achievable for such pollutant. BACT limitations must not cause the exceedance of any applicable New Source Performance Standards (NSPS) and/or National Emission Standards for Hazardous Pollutants (NESHAP).

The requirement to conduct a BACT analysis and determination is set forth in Section 165(a)(4) of the Clean Air Act and in federal regulations at 40 CFR 52.21(j). BACT must also comply with all the applicable limits established by the State of Illinois.

BACT is required for each regulated major source pollutant emitted in excess of the significant emission rates. Individual BACT determinations are to be performed for each pollutant subjected to a PSD review emitted from the same emission unit. The BACT determination must also separately address, for each regulated pollutant with a significant emission increase at the source, air pollution controls for each emissions unit or pollutant emitting activity subject to review.

Based on emission estimates for the proposed project, a BACT review is required for both SO_2 and CO control for the proposed project and is presented in the following format:

- BACT procedures
- Control Technology Review
- Previous BACT Determinations
- BACT Conclusion

Preparation of the BACT analysis included in this document incorporates the most recent "top-down" BACT guidance (EPA, 1990) by United States Environmental Protection Agency (EPA) for PSD permit determinations. That is, for each pollutant, the most stringent emission limit potentially applicable for a given pollutant was considered and then compared to the proposed project to determine its technical and economic feasibility.

When the most stringent technically feasible emission limitation is not selected as BACT, justification must be provided in terms of adverse economic, environmental, or energy impacts. Several other factors may be considered in justification of rejecting more stringent controls, including:

a. A showing that utilizing the control would adversely impact the project's financial viability.

b. A showing that the costs associated with the control are significantly higher for this specific project than for other similar projects that have installed this control system or in general for controlling the pollutant.

c. A showing that those economic considerations outweigh the energy and environmental benefits.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4.0
SO_2 CONTROL TECHNOLOGY REVIEW

4.1 REQUIREMENTS AND APPLICABILITY

The sources of SO_2 emissions impacted by the proposed production increases and considered as a part of the BACT review include the blast furnace stoves, the blast furnace casthouse, the ladle dryer preheater and the continuous casters. The increase in iron-making by the blast furnaces may correspondingly increase the production of process blast furnace gas.

4.2 INHERENTLY LOWER-EMITTING PROCESSES/PRACTICES

4.2.1 Blast Furnace Stoves

The blast furnace stoves will burn increased amounts of blast furnace gas and comparable amounts of natural gas to accommodate the production increase. Due to the low concentrations of SO_2 and other pollutants in blast furnace gas and natural gas, these products are typically thought of as clean burning fuels[1].

Emissions of SO_2 will be impacted by the quantity of fuel required and the sulfur content of the fuel. For example, blast furnace gas has trace amounts of sulfur but is lower in heating value than natural gas or fuel oil. Therefore, it takes a much greater volume of blast furnace gas to provide the same heat energy as these other fuels. The greater volume and respective sulfur concentration must be compared to the lower volumes and respective sulfur concentration for natural gas or fuel oil to determine a lower emitting practice.

Based on fuel data for each type of fuel used, the lowest emitting fuel for SO_2 is natural gas (approximately 6.0×10^{-4} lbs/mmBtu). The next lowest emitting fuel for SO_2 is blast furnace gas (approximately 8.3×10^{-2} lbs/mmBtu). There may be a small increase in fuel oil use associated with the production increase. Fuel oil combustion results in SO_2 emissions of approximately 1.0 lb/mmBtu.

Increased quantities of blast furnace gas will be produced by the blast furnaces with the proposed production increase. If this fuel is not used in the blast furnace stoves or in other combustion sources, it must be flared. Although blast furnace gas is a higher emitting fuel than natural gas, substituting natural gas at the blast furnace stoves would still result in the combustion of the blast furnace gas at the flare. Therefore, combustion of blast furnace gas in the blast furnace stoves is the inherently lowest emitting practice on a plantwide basis.

4.2.2 Casthouse Emissions

As discussed in Section 1.2, SO_2 emissions from iron-making operations are limited by process practices. At the blast furnace, sulfurous gases are removed by the molten iron oxide and flux. This effectively reduces SO_2 emissions to trace amounts[4]. No other lower emitting practices are in use in the steel industry[3,4,5].

4.2.3 Ladle Dryer Preheater and Continuous Caster Emissions

The ladle dryer preheater and continuous casters may require an increase in fuel usage as a result of the production increase. However, because natural gas is the only fuel used at these units, the lowest emitting practice is in place and will continue to be employed.

4.3 SO_2 CONTROL TECHNOLOGY OPTIONS

There are no add-on SO_2 control technologies currently in use in the steel industry for SO_2 control at blast furnace stoves using process blast furnace gas, or to control SO_2 at the blast furnace casthouse, ladle dryer preheater and continuous casters.

4.4 INFEASIBLE OPTIONS - SO_2

The proposed production increases to the blast furnaces will result in increased blast furnace gas generation and require additional fuel combustion in the blast furnace stoves. Blast furnace gas and natural gas are considered clean fuels and are the preferred supplemental fuels for the increased combustion needs based on inherently lower emitting practices.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Blast furnace gas is a low Btu fuel (approximately 80 Btu/cubic feet). Because of its low Btu value, large volumes of blast furnace gas are necessary to produce the required heat energy for the proposed production increases. Because the use of blast furnace gas in some processes is limited by other factors, such as physical limitations of the gas lines and burners, natural gas may also be used as a supplemental fuel. However, the overall quantity of natural gas usage throughout the plant will remain constant.

Blast furnace gas and natural gas typically contains approximately 0.01 and 0.001 percent sulfur (by weight). Based on these low sulfur concentrations, SO_2 reduction using add-on controls is technically infeasible.

4.5 SELECTED BACT - SO_2

Based on a review of the BACT/LAER clearinghouse, information obtained from the U.S. EPA Control Technology Group, and literature from the U.S. EPA Office of Air Quality Planning and Standards, no add-on BACT determination has been made for SO_2 emissions at these sources. Based on the extremely low concentrations of SO_2 in blast furnace gas, control of SO_2 emissions at blast furnace stoves is not practiced in the steel industry[3,4,5].

The combustion of blast furnace gas in the blast furnace stoves to supplement existing fuel combustion is the only feasible option to support the proposed production increases. Therefore, this option is determined as BACT for SO_2.

Sulfur dioxide emissions from the blast furnace casthouse are effectively controlled by the solubility of sulfur containing gases in the liquid iron oxide and the efficiency of fluxing to remove impurities, including SO_2. Based on the low SO_2 concentrations in casthouse emissions, reduction using add-on controls is technically infeasible. SO_2 emissions from the blast furnace casthouse are effectively reduced by using current industry work practices. This option is selected as BACT for casthouse SO_2 emissions.

The use of natural gas in the ladle dryer preheater and continuous casters is the only feasible control option to support the proposed production increases based on inherently lower emitting practices.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5.0
CO CONTROL TECHNOLOGY REVIEW

5.1 REQUIREMENTS AND APPLICABILITY

The major sources of CO emissions impacted by the proposed production increases include the blast furnace stoves, the basic oxygen furnaces (BOF), the ladle dryer preheater and the continuous casters. CO emissions may increase as a result of additional process blast furnace firing in the stoves, additional steel production at the BOF and additional fuel requirements at the ladle dryer preheater and continuous casters. A BACT review requires an evaluation of inherently lower-emitting processes/practices and technically feasible add-on controls.

5.2 INHERENTLY LOWER-EMITTING PROCESSES/PRACTICES

5.2.1 Blast Furnace Stoves

CO formation results from the incomplete combustion of fossil fuels and oxidation of carbon containing materials. The better the combustion practices, the lower the CO formation.

Good combustion practices requires the following elements:

- Proper fuel/air mixture
- Proper mixing
- High temperature

Good combustion practice is the inherently lowest emitting method of controlling CO emissions from combustion sources[2,6].

5.2.2 Basic Oxygen Furnaces (BOF)

CO is formed in the BOFs by oxidizing carbon in the molten iron. Because high-purity oxygen is the industry standard for making steel, there is no lower-emitting practice for this source.

5.2.3 Ladle Dryer Preheater and Continuous Casters

The ladle dryer preheater and continuous casters may require an increase in fuel usage as a result of the production increase. However, because natural gas is the only fuel used at these units, the lowest emitting practice is in place and will continue to be employed.

5.3 CO CONTROL TECHNOLOGY OPTIONS

The following control technologies are currently available to control CO emissions from affected sources.

5.3.1 Blast Furnace Stoves

The following add-on control technology options are currently available to control CO emissions from the blast furnace stoves:

- Direct Combustion (flaring)
- Thermal Oxidization
- Catalytic Oxidation

5.3.1.1 Direct Combustion

Flaring is a combustion control process in which combustible gases are burned in an open flame in the open air using a specially designed burner tip. Completeness of combustion in a flare is governed by flame temperature, residence time in the combustion zone, turbulent mixing, and available oxygen. The major factors affecting flare combustion efficiency are gas flammability, auto-ignition temperature, heating value (Btu/scf), density, and flame zone mixing.

The heating value affects flame stability, emissions, and flame structure. A lower heating value produces a cooler flame that does not favor combustion and is more easily extinguished.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5.3.1.2 Thermal Oxidizers

Thermal oxidizers refer to any device that uses a flame combined within an enclosed chamber to convert combustible gases to carbon dioxide and water. Thermal oxidizers operate most effectively at temperatures between 1,300 to 1,500°F with a residence time of 0.1 to 0.5 seconds. By raising the temperature, the residence time for complete combustion can be reduced and vice versa. However, temperature is the more important process variable. The removal efficiency for CO is in the range of 90 to 95 percent.

Besides temperature and residence time, the concentration of the pollutant in the gas stream also affects operation of the system. The concentration of the pollutant dictates the amount of supplemental fuel required. Low concentrations of the combustible gas require increased supplemental fuel usage.

5.3.1.3 Catalytic Oxidation

Catalytic incinerators employ a bed of active material (catalyst) that facilitates the overall combustion reaction. The catalyst is a substance that speeds up the rate of a chemical reaction at a given temperature without being permanently altered. The use of a catalyst in an enclosed combustor enables oxidation at temperatures in the range of 500 to 600°F. Common catalysts used in catalytic oxidation units are platinum or other metals. The catalysts are placed on an alumina pellet support or honeycomb support. The typical removal efficiency with this type of control is 90 percent.

Certain contaminants contained in the exhaust gas streams will chemically react or alloy with the catalyst and cause deactivation, including most heavy metal compounds. Sulfur is also considered a catalyst poison, but its effect is reversible.

5.3.2 Basic Oxygen Furnaces (BOF)

The BOF receives a charge composed of approximately 30 percent scrap and 70 percent molten iron and converts it to molten steel by utilizing a jet of high purity oxygen. The oxygen oxidizes the carbon and silicon in the molten iron, removes them, and provides heat for melting scrap.

Two primary systems for hooding and combustion of the BOF gases are currently used. The following control technologies are currently available and in use to control CO emissions from BOF vessels.

- Closed-hood combustion with exhaust stack flare
- Open-hood combustion with no additional controls

5.3.2.1 Closed-Hood Combustion w/Flare

A closed hood system suppresses combustion at the hood and collects the gases for combustion of CO at an exhaust stack flare. In a closed-hood system movable skirts seal the top of the furnace to limit air induction. Suppressed combustion hoods discourage air infiltration, with as low as 5 percent theoretical air. By suppressing combustion, the CO concentration is increased and the gases are more easily flared.

5.3.2.2 Open-Hood Combustion

Open combustion hoods allow excess air to be introduced in quantities up to 300 percent. With open hoods there is a gap between the hood and the furnace top into which air can be induced. In an open-hood system CO gases are combusted in the primary hood system with the addition of the excess air.

5.3.3 Ladle Dryer Preheater and Continuous Casters

There are no add-on CO control technologies currently in use in the steel industry for CO control at the ladle dryer preheater or continuous casters.

5.4 INFEASIBLE OPTIONS - CO

Low concentrations of CO are not effectively and efficiently controlled by emissions control devices[8]. Due to the low concentrations of CO gas in the exhaust stream of the blast furnace stoves, which are below the lower explosive limit (LEL) of 12.5 percent for CO, sustained

combustion (flaring) cannot occur[7] without the use of a supplemental fuel. Because the use of supplemental fuel at the flare would result in higher emissions of other pollutants and the formation of additional CO, this is an infeasible option.

The Granite City facility is already equipped with an open hood system on the BOFs where CO is combusted in the hood. Switching to a closed-hood system would require a large capital expense and would be economically infeasible. The residual CO from open-hood combustion is at a concentration level that is not technically feasible to treat further.

5.5 SELECTED BACT - CO

A review of BACT/LAER Clearinghouse, U.S. EPA Control Technology Group, and U.S. EPA Office of Air Quality and Planning literature was conducted to determine the current BACT status for sources within the steel industry. Based on this review and the previous evaluation of BACT options, the following BACT determinations for CO were made for sources impacted by the proposed production increases.

5.5.1 BACT - Blast Furnace Stoves

BACT literature indicates that blast furnace stoves at steel mills are not using add-on control equipment for CO emissions control. CO emissions can be adequately controlled by the use of good combustion practices. Therefore the BACT recommendation for control of CO emissions from the blast furnace stoves is the maintenance of good combustion practices.

5.5.1 BACT - Basic Oxygen Furnaces (BOF)

The open hood system used by Granite City Steel is a process control with the CO being combusted in the hood system. This type of process does not use add-on controls. After combustion in the open hood system, the CO average concentration is approximately 2500 ppm. This concentration is too low for additional CO control to be technically feasible[8]. Therefore, the existing open hood system is determined to be BACT for the BOFs.

DRAFT REPORT

Emission Netting Analysis for Proposed Production Increase

Prepared for:

Granite City Division of National Steel Corporation Granite City, Illinois

Prepared by:

Woodward-Clyde
2318 Millpark Drive
St. Louis, Missouri

4E08109
October, 1994

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

THIRD DRAFT

1.0
EXECUTIVE SUMMARY

The Granite City Division of National Steel Corporation intends to increase production at their Blast Furnaces, Basic Oxygen Furnaces, and Continuous Casters. The proposed production level is set out in the following table.

PRODUCTION AREA	PROPOSED PRODUCTION (NTPD)
BLAST FURNACE	9,100
BOF SHOP	10,300
CASTERS	10,300

There will be changes in regulated air pollutants accompanying this increase in production. Production related emission increases and contemporaneous emission changes were calculated in accordance with Illinois Environmental Protection Agency (IEPA) regulations for Construction and Modification of Major Stationary Sources (Part 203).

A baseline period for this analysis was chosen to be the period August 1992 through July 1994. Emission changes (related to the production increase and contemporaneous changes) were calculated for:

- Carbon Monoxide (CO)
- Nitrogen Oxides (NO_X)
- Sulfur Dioxide (SO_2)
- Particulate Matter less than 10 Microns (PM_{10})
- Particulate Matter (TSP)
- Volatile Organic Material (VOM)
- Lead (Pb)

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

The following conclusions were reached regarding the magnitude of the net emission changes related to the production increase and contemporaneous emissions changes:

POLLUTANT	NET EMISSION CHANGE
Carbon Monoxide	Significant
Nitrogen Oxides	Not Significant
Sulfur Dioxide	Significant
Total Suspended Particulate Matter	Not Significant
Particulate Matter less than 10 Microns	Not Significant
Volatile Organic Material	Not Significant
Lead	Not Significant

On the basis of these results, only carbon monoxide (CO) and sulfur dioxide (SO_2) will be considered further in the New Source Review process. Information contained in this report concerning the net emission changes for the significant pollutants are presented for information only since these pollutants will be considered in the review process.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

2.0 INTRODUCTION

The Granite City Division of National Steel Corporation intends to increase production at their blast furnaces, basic oxygen furnaces, and continuous casters. These increases in production require that air quality permitting issues be considered.

The first step in the air quality permitting process is a "netting" evaluation. This evaluation is used to determine whether an air quality permit and subsequent New Source Review is needed. The analysis considers the increase in emissions that will accompany the proposed project. The increase is measured against a base period which is typically taken as the actual annual emissions averaged over the 24 most recent months. Other base periods can be established if they can be shown to be more representative of normal source operations.

The base period used for this analysis is August 1, 1992 through July 31, 1994. This period was selected because it represents the most recent available 24 month period consistent with IEPA Regulation 203.104. While this period has been used for this analysis, it should be noted that there was significant downtime related to furnace repairs in 1992 which has the effect of depressing base period production.

Changes in emissions expected as a result of the proposed increase in production were in most cases scaled from the base period average actual annual emission rate based on fuel usage and production rates consistent with the proposed production increase. A factor was developed by dividing the proposed production levels by the base period production levels as shown in the following table. (Appendix A contains additional information on the base period production and fuel use. Figure 1 shows production trends for the mill.)

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

PRODUCTION AREA	AUGUST 1992 - JULY 1994 PRODUCTION (NTPD)	PROPOSED PRODUCTION (NTPD)	RATIO
BLAST FURNACE	5,643	9,100	1.613
BOF SHOP	6,612	10,300	1.558
CASTERS	6,612	10,300	1.558

In certain instances where there is an allowable emission limitation, that limitation was used as the basis of calculating the potential emissions levels associated with the proposed production limit increases.

The netting analysis also considers contemporaneous emission changes, both increases and decreases. Contemporaneous changes are defined as changes that have occurred over the past five years.

The analysis is carried out individually for each pollutant that will be effected by the proposed change in source operations. In this case, emissions of Sulfur Dioxide (SO_2), Particulate Matter (TSP and PM_{10}), Nitrogen Oxides (NO_X), Volatile Organic Material (VOM), Lead (Pb), and Carbon Monoxide (CO) were evaluated.

For each pollutant for which the source is major, the net emission change is compared against significance levels specified in new source review guidelines. If the net changes in emissions that result from the planned project plus contemporaneous changes for any single pollutant exceed the applicable significance level, the project is treated as a major modification of the source. The significance levels applicable for this project are:

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Pollutant	Significance Level (tons per year)
Carbon Monoxide	100
Nitrogen Oxides	40
Sulfur Dioxide	40
Total Suspended Particulate	25
Particulate Matter < 10 microns	15
Volatile Organic Material	40
Lead	0.6

The procedures, assumptions, and results are discussed for each pollutant considered.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

3.0
CARBON MONOXIDE

CO emissions that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Boilers 1-12
- BOF Vessels
- Continuous Casters
- By-Products Flare
- Ladle Dryer & Preheater

Table 1 presents the estimated increases in CO emissions associated with the production increase. The total increase in CO emissions is 6,514 tons per year.

Based on information provided by Granite City Steel, there have been two projects within the five year contemporaneous time frame which resulted in changes to CO emissions. Appendix B presents information on the emission changing projects.

Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1, 1991	-22.1
Shutdown of Batch Annealing	December, 1991	-1.2
Net Decrease		**-23.3**
Proposed Production Increase	To Be Determined	+6,513.7
Net Emission Change		**+6,490.4**

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

On the basis of these calculations, the proposed production increase would result in a net CO emission increase in excess of the significance level (100 tpy). Thus the production increase would be classified as a major modification and Prevention of Significant Deterioration review requirements would apply for this pollutant.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4.0
NITROGEN OXIDES

Nitrogen Oxides emission sources that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Boilers 1-12
- BOF Vessels
- Caster Molds
- Continuous Casters
- By-Products Flare
- Ladle Dryer & Preheater
- Blast Furnace Casthouse

Table 2 presents the estimated increases in NO_X emissions associated with the production increase. The total increase in NO_X emissions is estimated to be 256 tons per year.

Based on information provided by Granite City Steel, there have been two projects within the five year contemporaneous time frame which resulted in changes to NO_X emissions. Appendix B presents information on the emission changing projects.

Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1, 1991	-217.8
Shutdown of Batch Annealing	December, 1991	-8.7
Net Decrease		**-226.5**
Proposed Production Increase	To Be Determined	+256.3
Net Emission Change		**+29.8**

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

On the basis of these calculations, the proposed production increase would result in a net NO_X emission change below the significance level (40 tpy). Thus the production increase would not require Prevention of Significant Deterioration (for NO_2) or Nonattainment New Source Review (for O_3).

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5.0
SULFUR DIOXIDE

SO_2 emissions that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Boilers 1-12
- BOF Vessels
- Blast Furnace Casthouse
- Continuous Casters
- By-Products Flare
- Ladle Dryer & Preheater

Table 3 presents the estimated increases in SO_2 emissions associated with the production increase. The expected increase in SO_2 emissions is 481 tons per year.

Based on information provided by Granite City Steel, there have been two projects within the five year contemporaneous time frame which resulted in changes to SO_2 emissions. Appendix B presents information on the emission changing projects.

Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1, 1991	-0.34
Shutdown of Batch Annealing	December, 1991	-0.04
Net Decrease		**-0.4**
Proposed Production Increase	To Be Determined	+481.8
Net Emissions Change		**+481.4**

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

On the basis of these calculations, the proposed production increase would result in a net SO_2 emission increase in excess of the significance level. Thus the production increase would be classified as a major modification and Prevention of Significant Deterioration requirements would apply for this pollutant.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

6.0
PARTICULATE MATTER

Particulate Matter (PM_{10} and TSP) emissions that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Boilers 1-12
- By-Products Flare
- BOF Vessels
- Continuous Casters
- Ladle Dryer & Preheater
- Blast Furnace Process Emission Points
- BOF Shop Process Emission Points
- Continuous Caster Process Emission Points
- Fugitive Emissions from Roads and Materials Handlings

Particulate matter emission increases are affected by the types and amounts of fuel used in each process unit that will be affected by the production increase.

Appendix C presents information regarding fugitive emissions increases from roads and materials handling areas. Figures 3 through _ show the road network used in this analysis.

The baseline set of information used is from a 1988 fugitive emission inventory. Based on that information, emissions were scaled to a base period (August, 1992 to July 1994) estimate using the increase in production (16.9%) and then reductions were calculated to reflect road paved or to be paved for credit, and additional proposed controls to paved and unpaved roads.

The specific fugitive dust control program that is proposed in addition to paving includes:

- three times a month spraying of unpaved roads (except when not required because of naturally wet or frozen conditions); and
- daily sweeping of paved roads shown on Figure 3, Figure _,.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Table 4 and Table 5 present the estimated changes in PM_{10} and TSP emissions associated with the production increases and fugitive dust controls to roads. The total increase in PM_{10} and TSP emissions is 8 and 26 tons per year, respectively. In both cases, the decrease in emissions are due to reductions in unpaved road fugitive dust emissions, paving of some previously unpaved roads, and sweeping of paved roads.

Based on information provided by Granite City Steel, there have been five projects (in addition to control of fugitive emissions from roads) within the five year contemporaneous time frame which resulted in changes to PM_{10} emissions. Appendix B presents information on the emission changing projects.

Projects considered in calculating the net PM_{10} emission change are listed in the table below.

PROJECT	DATE	PM_{10} EMISSION CHANGE (tpy)
Remove Blast Furnace Slag Spout Hood	January, 1990	+4.9
# 2 Caster Production	December 1, 1990	+11.7
Ingot Teeming Shutdown	April 1, 1991	-22.4
Shutdown of Blooming Mill	April 1, 1991	-3.4
Shutdown of Batch Annealing	December, 1991	-0.2
Net Decrease		**-9.4**
Proposed Production Increase	To Be Determined	+7.9
Net Emissions Change		**-1.5**

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Projects considered in calculating the net TSP emission change are listed in the table below.

PROJECT	DATE	TSP EMISSION CHANGE (tpy)
Remove Blast Furnace Slag Spout Hood	January, 1990	+4.9
# 2 Caster Production	December 1, 1990	+11.7
Ingot Teeming Shutdown	April 1, 1991	-22.4
Shutdown of Blooming Mill	April 1, 1991	-3.4
Shutdown of Batch Annealing	December, 1991	-0.2
Net Decrease		**-9.4**
Proposed Production Increase	To Be Determined	+25.7
Net Emissions Change		**+16.3**

On the basis of these calculations, the proposed production increases and additional dust controls will result in a net decrease in PM_{10} and net increase in TSP particulate matter emissions. Because the TSP increase is less than the 25 tons per year significance threshold, the production increase will not trigger Nonattainment New Source Review for PM_{10} or TSP.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

7.0
VOLATILE ORGANIC MATERIAL

The Blast Furnace Casthouse is the primary source of Volatile Organic Material (VOM) emissions increase that would result from the proposed production increase.

Table 6 presents the estimated increases in VOM emissions associated with the production increase. The total increase in VOM emissions is estimated at 67.7 tons per year. The increased emissions due to production increases were estimated by increasing 1993 emissions proportionally.

Based on information provided by Granite City Steel, there have been three projects within the five year contemporaneous time frame which resulted in changes to VOM emissions. Appendix B presents information on the emission changing projects.

Projects considered in calculating the net VOM emission change are listed in the table below.

PROJECT	DATE	EMISSION REDUCTION (tpy)
Installation NESHAP Controls Coke By-Product	July, 1991	-31.6
Shutdown of Blooming Mill	April 1, 1991	-0.9
Shutdown of Batch Annealing	December, 1991	-0.3
Net Decrease		**-32.9**
Proposed Production Increase	To Be Determined	+67.7
Net Emissions Change		**+34.8**

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

On the basis of these calculations, the proposed production increase would result in a net increase in VOM emissions below the applicable significance level of 40 tons per year. Thus the production increase would not require a Nonattainment New Source Review for this pollutant.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

8.0
LEAD

Table 7 presents the estimated increases in lead emissions associated with the production increase. The total increase in lead emissions is estimated at 0.48 tons per year. The increased emissions due to production increases were estimated by increasing 1993 emissions proportionally.

On the basis of these calculations, the production increase results in increased lead emissions less than the 0.6 tons per year significance threshold. Therefore, a PSD Review for this pollutant is not required.

REMOVAL OF BLAST FURNACE SLAG SPOUT HOOD - JANUARY 1990

Based on May 8, 1969 submittal for modification of operating permit for "A" and "B" Blast Furnaces. +4.9 TPY

#2 CASTER PRODUCTION - DECEMBER 1990

Summary of Project Emission Changes (tons/yr)[1] (Assuming all steel produced is continuous cast)

Argon Stirring and Baghouse	4.85
Tundish with Shrouds	--
Powder Addition	7.49
Slab Casting	2.01
Slab Cut-off	9.03
Slab Ripping and Baghouse	2.58
	26.0 tons/yr PM_{10}
Caster #1 Actual Emissions	14.3 tons/yr PM_{10}
Caster #2 Actual Emissions	26.0 - 14.3 = 11.7 tons/yr PM_{10}

INGOT TEEMING SHUTDOWN - APRIL 1991

670,000 tons/yr * 0.067 lbs/ton = 22.4 tons/yr PM_{10} reduction

[1]Reference - March 16, 1988 IEPA "Project Summary for Proposed Issuance of an Air Pollution Control Construction Permit for Continuous Caster"

INSTALLATION OF NESHAP CONTROLS AT COKE BY-PRODUCT PLANT

VOC Emissions Reduction at Coke By-Product Plant after Installation of NESHAPS Controls

It was reported, in Attachment 2 of the October 8, 1991 submittal of additional information in application for modification of Operating Permits for the Granite City Division Emission Reduction Plant Production Increase Project, that the installation of benzene emission controls (NESHAPS) at the Coke By-Product Recovery Plant would provide a reduction of 31.6 TPY VOC other than benzene. The following is a demonstration of the derivation of that VOC emission reduction.

All calculations are based on 1990 coke production of 577,473 tons.

Emission factors are taken from the publication EPA-450/3-83-016a, "Benzene Emissions from Coke By-Product Recovery Plants - Background Information for Proposed Standards." The NESHAPS emission factors contained in this publication are for benzene only. The emissions of other light oil (L.O.) constituents were calculated by taking the ratio of the mole fraction of each L.O. constituent (liquid) times the vapor pressure of that constituent to the mole fraction of benzene (liquid) times the vapor pressure of benzene, then multiplying that ration by the calculated benzene emissions. It is assumed that all emissions are vapors and that the vapors are in equilibrium with the liquid light oil.

Sample calculation:

For the direct water cooling tower, benzene emissions are calculated as follows:

$$(577{,}473 \text{ tons coke}) \times \frac{2000 \text{ lb.}}{\text{ton}} \times \frac{454 \text{g}}{\text{lb.}} \times \frac{1 \text{ Mg}}{10^6 \text{g}} = 524{,}346 \text{ Mg coke}$$

$$\frac{524{,}346 \text{ Mg coke}}{\text{yr.}} \times \frac{270 \text{g}}{\text{Mg}} \times \frac{1 \text{ lb.}}{454 \text{g}} = 311{,}836 \text{ lb./year}$$

where 270g/Mg = uncontrolled benzene emission factor from Table 3 - 7, attached.

From the Light Oil Constituents table, attached,

Benzene: $y(P^*) = .71(96) = 68.16$

where .71 = benzene mole fraction
and 96 = benzene vapor pressure

Similarly,

Toluene: $y(P^*) = .159(30) = 4.77$

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Hence, the toluene emissions, with no controls, from the direct water cooling tower are

$$\frac{4.77}{68.16} \text{ (311,836 lb/yr.)} = 21{,}823 \text{ lb. toluene/year}$$

Toluene emissions after installation of NESHAPS controls with 100% efficiency are

21,823 lb. toluene (100 - 100) = 0 lb. toluene/yr.

Emission of benzene, toluene, xylene, ethylbenzene and styrene are calculated, as above, for the various emission sources at the By-Product Plant and presented in the table Emissions of Light Oil Constituents after Installation of NESHAPS Controls at the Coke Oven By-Products Plant, attached.

The non-benzene emissions controlled by the NESHAPS project are then calculated, for each light oil constituent considered, by subtracting the total emissions after controls were applied at all sources from the total emissions prior to application of controls at all sources. These calculations are presented in the table entitled Non-Benzene Emissions Controlled by NESHAPS Project, attached.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Non-Benzene Emissions Controlled by NESHAPS Project

	Total Uncontrolled Emissions	-	Total Uncontrolled Emissions after NESHAPS Controls Installed	=				=	
Toluene	59,584	-	997	=	58,587 lbs.	x	$\frac{1T}{2000}$	=	29.3 tons/yr.
Xylene	2,871	-	48	=	2,823 lbs.	x	$\frac{1T}{2000}$	=	1.4 tons/yr.
Ethylbenzene	959	-	10	=	949 lbs.	x	$\frac{1T}{2000}$	=	0.5 tons/yr.
Styrene	868	-	9	=	859 lbs.	x	$\frac{1T}{2000}$	=	0.4 tons/yr.
									31.6 tons/yr.

SHUTDOWN OF BLOOMING MILL - APRIL 1991

Coke oven gas consumed at Soaking Pits, 1,076,926 MMBtu in 1990

The coke oven gas which was consumed at the Blooming Mill Soaking Pits (firing rate 408 MMBtu/hr/furnace) is to be used at the Hot Strip Slab Furnaces (1-3) (firing rate 321.8 MMBtu/hr/furnace) and Slab Furnace 4 (firing rate 495 MMBtu/hr).

The emission reductions for the displaced use of natural gas on the slab reheat furnaces is based on the AIRS 1990 emission factor for natural gas sources greater than 100 MMBtu/hr and the "ACT for NO_x Emissions from Iron and Steel Mills".

1990

Coke Oven Gas Soaking Pits - General (< 10 MMBtu/hr)

44,134 * 0.003 * 1/2000 = 0.066 tpy PM_{10} emission reduction
44,134 * 0.0006 * 1/2000 = 0.013 tpy SO_2 emission reduction
44,134 * 0.10 * 1/2000 = 2.21 tpy NO_x emission reduction
44,134 * 0.0053 * 1/2000 = 0.12 tpy VOM emission reduction
44,134 * 0.02 * 1/2000 = 0.44 tpy CO emission reduction

Natural Gas Blooming Mill (< 10 MMBTU/hr)

18,083 * 0.003 * 1/2000 = 0.027 tpy PM_{10} emission reduction
18,083 * 0.0006 * 1/2000 = 0.005 tpy SO_2 emission reduction
18,083 * 0.10 * 1/2000 = 0.90 tpy NO_x emission reduction
18,083 * 0.0053 * 1/2000 = 0.05 tpy VOM emission reduction
18,083 * 0.02 * 1/2000 = 0.18 tpy CO emission reduction

Coke Oven Gas Soaking Pits

1,076,926 * 0.005 * 1/2000 = 2.69 tpy PM_{10} emission reduction
1,076,926 * 0.0006 * 1/2000 = 0.32 tpy SO_2 emission reduction
1,076,926 * 0.399 * 1/2000 = 214.71 tpy NO_x emission reduction
1,076,926 * 0.0014 * 1/2000 = 0.75 tpy VOM emission reduction
1,076,926 * 0.04 * 1/2000 = 21.54 tpy CO emission reduction

*** Proposed controlled emissions include a 50% reduction for road sweeping dust control measures.**
**** Net Change represents the difference in the proposed controlled and the current controlled emissions.**
***** Segments are currently unpaved and current emissions are accounted for in the Unpaved Roads table.**
****** Half of the segment is proposed for paving. Proposed emissions reflect only the paved portion.**
(1) Adjusted to account for 16.9% increase in production between the 1988 inventory year and the August 1992 through July 1994 base period.

Dear Mr. Pelan:

Enclosed please find a diskette (5 1/4") containing a file (GCSSCRS0.INP) with the ISCST input information for Granite City Steel. The PSD inventory you requested will be forwarded to you at a later date. If you have further needs or questions, please feel free to contact me at (217)524-4788.

Sincerely,

Michael T. Reischel

Overland Park, Kansas 66211

Dear Mr. Pelan:

Enclosed please find three diskettes (5 1/4") containing the files you requested. Please return the diskettes after you have copied the data. The diskettes contain the following data:

a) five meteorological data files (for 1982-86) that use St. Louis for surface data and Salem for upper air data

b) three receptor grid files of varying resolution and coverage. These grids were used for SIP related modeling.

It is our recommendation that the PSD modeling should use the above years (1982-1986) of meteorological data for consistency with the SIP modeling.

I have enclosed a cross reference listing of our source I.D. numbers with corresponding emission unit names for your convenience. If you have any questions regarding PSD inventory or sources please contact Mr. Chris Romaine of our Permits Section at (217)785-1715. If you have further needs or questions, please feel free to contact me at (217)524-4788.

Sincerely,

Michael T. Reischel

PROJECT SUMMARY
FOR PROPOSED ISSUANCE OF
A CONSTRUCTION PERMIT
FOR GRANITE CITY DIVISION OF NATIONAL STEEL CORPORATION

Applicant:
Name: Granite City Division of National Steel Corporation
Address: 20th and State Streets, Granite City

Contact Person: Larry Siebenberger
Contact Person Phone: (618) 451-3456

Project:
Project: Increased iron and steel production
Project Location: Southeastern Granite City

Plant Name: Granite City Division of National Steel Corporation
Location Identification Number: 119813AAI
Application Number: 95010001

Significant Dates:
Application Received: January 3, 1995
Public Hearing
Scheduled For: 7:00 p.m., Thursday, December 20, 1995
Comment Period Ends: January 19, 1996

Hearing Location: Granite City Township Hall, 2060 Delmar in Granite City, Illinois

Illinois EPA contacts:
Permit Section - Name: Jim Ross
Address: ~~1340 N. Ninth Street~~
P.O. Box 19506
Springfield, Illinois 62794-9506
Telephone: 217/785-1878

Telecommunications Device for the Deaf: 217/782-2143

Field Operations Sections - Name: Jeff Benbenek
Address: 2009 Mall Street
Collinsville, Illinois 62234
Telephone: (618) 346-5120

Corrections FAXed to Ross
JB

INTRODUCTION:

Granite City Division (GCD) of National Steel Corporation is a steel mill located on about 1100 acres of land largely within the city limits of Granite City. GCD has conducted iron and steel making at this site since 1878. The final product at GCD is in the form of flat steel coils. GCD has requested that the Illinois Environmental Protection Agency (Agency) issue a construction permit to allow an increase in iron and steel production.

The Agency has reviewed the permit application and concluded that the project complies with applicable state and federal regulations governing air pollution. As a result, the Agency has prepared a draft of a construction permit which would allow the production increase.

The project is considered significant under the federal Prevention of Significant Deterioration (PSD) rules for carbon monoxide (CO) and sulfur dioxide (SO2). The net emissions change is not considered significant for particulate matter (PM), particulate matter less than or equal to 10 microns in size (PM-10), nitrogen oxides (NOx), volatile organic material (VOM), and lead.

DESCRIPTION OF OPERATIONS:

GCD operates an integrated steel mill. An integrated steel mill starts with iron ore, reduces this material to iron, and then converts this iron to steel. Equipment used includes blast furnaces, basic oxygen furnaces, and continuous casters.

Iron Production

The iron making process begins at two blast furnaces where iron ore, steel scrap, coke, limestone, fluxing agents, and large quantities of hot air react to produce molten iron (a.k.a. hot metal). A by-product "blast furnace gas" is collected at the top of the furnace and is used as a fuel, primarily in stoves to heat the air used in the furnace.

Steel Production

The molten iron is then transported to the basic oxygen furnace (BOF) shop for conversion to steel. After transfer to ladles, the sulfur content of the molten iron is reduced at a desulfurization station. Next, the iron is poured into one of two identical BOF vessels along with steel scrap, limestone and other flux forming materials. A large pipe known as a lance is then lowered down through a hole in the lid of the BOF to within a foot of the iron. Oxygen is then blown into the BOF through the lance, thus burning or oxidizing the carbon in the iron and converting the iron to steel. The liquid steel is then

transferred to the ladle metallurgy station where the properties of the steel may be adjusted by adding alloying materials prior to casting.

Casting

Two continuous casters are used to produce solid steel slabs from the liquid steel. The liquid steel is poured into the top of water-cooled caster molds where it is continuously shaped and cooled until the desired steel slab emerges from the bottom of the mold. The slabs are then cut to the desired length for further processing.

Ancillary Activities

GCD uses several large boilers to provide steam for use in the plant. Fuel is also combusted in the blast furnace stoves, slab reheat furnaces, and several smaller units such as ladle preheaters. For fuel, GCD utilizes the by-product blast furnace gas, as well as by-product coke oven gas, and natural gas and oil.

GCD also operates a coke plant, coke by-products recovery plant, and cold and hot steel rolling operations. No changes in these operations are expected.

DESCRIPTION OF PROPOSED PROJECT:

GCD is requesting an increase in the allowable production rate of iron at the blast furnaces and steel at the basic oxygen furnaces. Continuing improvements in the science of steel making (e.g., higher yield ores, longer life refractory furnace linings, and better timing of equipment maintenance) have enabled increased production from GCD's existing furnaces. Only minor physical changes are needed for the proposed increases (e.g., increased capacity of blast furnace stove blowers).

EMISSIONS:

The operations at GCD are sources of emissions and various control measures are used to minimize these emissions. In particular, the emissions of particulate matter at the blast furnace when tapping molten iron are controlled by a large baghouse, and a large electrostatic precipitator (ESP) is used to control the BOF vessel emissions.

Also of importance to this evaluation are other projects which have affected emissions and which have occurred over the last five years. These projects and the emission changes associated with them are summarized in Table 1.

TABLE 1- EMISSIONS SUMMARY (tons/year)

Other projects changing emissions since 1990	Date	PM/ PM-10	SO2	NOx	CO	VOM	Lead
Removal of blast furnace slag spout hood	1/90	+4.9					
Addition of #2 continuous caster	12/90	+11.7					
Shutdown of ingot teeming operations	4/91	-22.4					
Shutdown of blooming mill	4/91	-3.38	-0.34	-217.8	-22.1	-0.9	
Installation of NESHAP controls at Coke By-Products plant	7/91					-31.6	
Shutdown of batch annealing	12/91	-0.18	-0.04	-8.7	-1.2	-0.3	
Initiation of fugitive dust control program[1]	11/91 - present	-416					
Installation of #8 galvanizing line	96	+4.0/ +3.8	+2.0	+18.4	+10.2	+1.2	
Subtotal		-421.3/ -421.6	-0.18	-208.1	-13.1	-31.6	
Change in emissions from proposed production increase	96	-60.6/ +51.6	+475.8	+238.8	+5,685	+59.3	+0.54
Net change in emissions over the last 5 years		**-481.9/ -370.0**	**+470.3**	**+30.7**	**+5,672**	**+27.7**	**+0.54**
Net change in emissions over the last 5 years for purposes of NSR & PSD[2]		**-98.0/ +14.0**	**+470.3**	**+30.7**	**+5,672**	**+27.7**	**+0.54**

[1]Based on reduction in roadway emissions of 401 tons (428 - 27) and material handling of 15 tons (17 - 2).

[2]Cannot include some PM/PM-10 reductions from fugitive dust control since relied upon these reductions in the implementation plan used to demonstrate attainment with the NAAQS. Of the above 416 tons, 32 tons is considered creditable for PSD and NSR.

APPLICABLE EMISSION STANDARDS:

All emission sources in Illinois must comply with Illinois Pollution Control Board emission standards. The Board's emission standards represent the basic requirements for sources in Illinois.

Applicable emissions standards for PM and PM-10 for the blast furnaces, BOF vessels, continuous caster, and other operations are found in 35 Ill. Adm. Code Part 212, specifically in Subparts B, K and R.

Fuel combustion unit emission standards are found in 35 Ill. Adm. Code Parts 212, 214, 216, and 217.

After reviewing the technical material in the application, the Agency has determined that the operations at GCD should comply with all applicable standards.

ADDITIONAL REQUIREMENTS FOR MAJOR PROJECTS:

Regulations which address the affect of a project on the air quality are found in 35 Ill. Adm. Code Part 203 (NSR) and the federal rules for Prevention of Significant Deterioration (PSD) - 40 CFR 52.21.

Projects are required to meet additional requirements if the change in emissions is significant as shown below.

- Significant Levels for NSR and PSD:

PM-10	PM	NOx	SO2	CO	VOM	Lead
15	25	40	40	100	40	0.6

The increases in emissions of lead and VOM with increased production are not significant under NSR or PSD.

The increase in emissions of NOx are being accompanied by contemporaneous emission decreases provided by the shutdown of equipment and operations such that the net emissions change is not significant under NSR or PSD.

The increase in emissions of PM and PM-10 are being accompanied by contemporaneous emission decreases provided by the shutdown of equipment and operations, additional road dust control, and improvements to BOF emissions capture system such that the net emissions change is not significant under NSR or PSD.

The increases in emissions of SO2 and CO are significant under PSD. Accordingly, the project is considered a major modification and must comply with the requirements of PSD.

The requirements of PSD include a demonstration that best available control technology (BACT) will be used for SO2 and CO emissions at affected units, an analysis of air quality impacts, and an analysis of the impacts of the project on visibility, vegetation's and soils. The Agency has determined that these requirements have been met.

GCD has shown that work practices used for SO2 and CO constitute BACT as used by other steel mills for these pollutants. The air quality analysis included with the application shows that increased production will not cause a violation of the NAAQS for SO2 or CO. Increased production also will not significantly affect soils, vegetation, or visibility.

DISCUSSION OF PM-10 ATTAINMENT STATUS:

Of special concern for this project is the emissions of PM-10, since GCD is located in an area that is designated as nonattainment for PM-10 air quality. The Agency is currently working to reclassify the Granite City area from nonattainment with the National Ambient Air Quality Standard (NAAQS) to attainment. The modeling evaluation performed by the Agency shows that the area will continue to comply with the PM-10 air quality standards at the level of emissions associated with the requested increase in production. This is in part due to the stringent levels of control now required to control process emissions and fugitive emissions from roadways and material handling. These measures have resulted in substantial reductions in PM-10 emissions in the area, such that the last exceedance of the PM-10 air quality standard was monitored in 1990. It is also due to substantial improvements made by GCD to the BOF control system. In particular, GCD has added a fourth section to the BOF ESP at an approximate cost of $7,000,000. This provides additional capacity for the ESP to collect and control emissions from the BOF and reduce the amount of uncaptured PM-10 that would otherwise escape through the top of the BOF shop. As part of this permit, GCD will now be required to comply with a more stringent limit on uncaptured emissions, i.e., 20 percent opacity on a three minute average versus the current limit of 30% opacity on a six minute average.

Emissions modeling performed by the Agency shows that the PM-10 NAAQS will be met at the emission levels which could occur at the proposed rates of increased production. That is, modeling shows that the air quality will meet the national standard after this project.

In addition, GCD has also agreed to further control emissions through the sweeping of key Granite City public streets and through housekeeping and sweeping measures in the area below and surrounding the BOF ESP. These reductions are not included in the formal accounting of emissions, but will lower emissions levels in Granite City. Finally, GCD has recently started using a state of the art Enviro-Whirl™ road sweeper which should provide even better dust control from plant roads.

CONTENTS OF PERMIT:

The permit specifies required control practices to ensure that all applicable emission limits and requirements are met both initially and on a continuing basis. The permit also contains conditions on emissions, operations, production, recordkeeping, compliance procedures, testing, and reporting.

REQUEST FOR COMMENTS:

It is the Agency's preliminary determination that the proposed project meets all applicable State and Federal air pollution control requirements. Accordingly, the Agency is proposing to issue a permit for this project.

Comments are requested by the Agency on the proposed issuance of this permit and the proposed conditions of the draft permit. Comments must be addressed to the Illinois Environmental Protection Agency, Division of Air Pollution Control, Attention: Jim Ross, P.O. Box 19506, Springfield, Illinois 62794-9506.

DRAFT 11/03/95

CONSTRUCTION PERMIT

PERMITTEE

Granite City Division
of National Steel Corporation
Attn: Joseph S. Kocot
20th & State Street
Granite City, IL 62040

Application No.: 95010001 I.D. No.: 119813AAI
Date Received: January 3, 1995
Subject: Production Increase
Date Issued:
Location: Southeastern Granite City

Permit is hereby granted to the above-designated Permittee for an increase in the allowable production rate of iron (from 2,372,500 to 3,165,000 net tons per year) and steel (from 2,774,000 to 3,580,000 net tons per year) as described in the above-referenced application. This permit is subject to standard conditions attached hereto and the following special conditions:

1. Prior to issuance of this permit, a draft of this permit has undergone a public notice and comment period, and a public hearing was held.

BLAST FURNACE OPERATIONS

2a. Total combined production of hot metal (a.k.a., iron) from blast furnaces A and B shall not exceed 9,849 net tons per day, averaged over any calendar month, and;

b. Total combined production of hot metal from blast furnaces A and B shall not exceed 3,165,000 net tons per year.

3a. Particulate emissions from the blast furnace casthouse baghouse and iron spout baghouse shall not exceed

0.010 gr/dscf, pursuant to 35 Ill. Adm. Code 212.445(b)(1).

b. The opacity of emissions from the blast furnace casthouse baghouse and the iron spout baghouse shall not exceed 10% on a 6 minute rolling average basis, pursuant to 35 Ill. Adm. Code 212.445(b)~~(1)~~(2)

4a. Emissions of particulate matter from any opening in the blast furnace casthouse shall not exceed 20% opacity on a 6-minute rolling average basis beginning from initiation of the opening of the tap hole up to the point where iron and slag stops flowing in the troughs, pursuant to 35 Ill. Adm. Code 212.445(a)(1).

5. Emissions from Blast Furnace operations shall not exceed the limits in attached Tables 1 and 5.

BASIC OXYGEN FURNACE SHOP

6a. Total combined production of liquid steel from the Basic Oxygen Furnaces (BOF's) shall not exceed 11,000 net tons per day, averaged over any calendar month, and;

b. Total combined production of liquid steel from the BOF's shall not exceed 3,580,000 net tons per year.

7a. The emissions of PM-10 from the BOF ESP stack for the total of all BOF processes (i.e., operations from the beginning of the charging process through the end of the tapping process) shall not exceed 0.225 lbs PM-10 per ton of steel produced, and;

b. The emissions of PM-10 from the BOF ESP stack for the total of all BOF processes (i.e., operations from the beginning of the charging process through the end of the tapping process) shall not exceed 60.0 lbs/hr. Notwithstanding the limitations set forth in special condition (a) above the emissions of PM-10 from the BOF ESP stack shall not exceed 60 lbs/hr for any one hour period.

8. Visible emissions from any opening in the BOF shop (e.g., roof monitor) shall not exceed 20% on a 3 minute rolling average basis.

9a. The Permittee shall determine the opacity from the ~~BOF roof monitor on at least a weekly basis.~~ openings in the BOF shop on at least a weekly basis.

Observations shall be conducted for at least an hour or the entire BOF cycle, whichever is greater.

b. The Permittee shall determine the opacity from the BOF ESP stack for at least one hour on any normal work day (i.e., Monday through Friday) that the continuous opacity monitor on the BOF ESP stack has an outage that exceeds two consecutive hours and is still down. The readings shall commence as soon as possible after the opacity monitor has been down for two consecutive hours. If meteorological conditions or lack of visibility preclude these observations from being conducted, then this shall be noted in the log book.

c. The opacity shall be determined in accordance with the observation procedures set out in 40 CFR Part 60, Appendix A, Method 9.

d. These determinations shall be recorded in a log book, which ~~includes~~ at a minimum shall include the date and time of observations, name and title of observer, individual opacity readings, calculated opacity so as to determine compliance with Section 212.123, and calculated opacity relative to 20% opacity on a three minute rolling average basis.

10. The Permittee shall follow the BOF operating procedures and requirements specified in attachment A. These requirements are designed to ensure proper operation of the BOF control system. These procedures shall be posted in the BOF pulpit (a.k.a., control room).

11. Flame suppression shall be used and maintained during the entire tapping process.

12a. The stack gas pulpit set point of the BOF ESP control system shall be set in accordance with the following, so as to establish sufficient particulate matter capture efficiency of the charging and primary hoods:

i. Set point requirements while only a single BOF vessel is in operation;

A. Minimum set point during charging process: 550,000 cfm;

B. Minimum set point during refining process: 650,000 cfm;

C. Minimum set point during tapping process: 200,000 cfm (until one minute after completing alloy addition);

ii. During dual operation of BOF vessels (a.k.a., overlapping BOF operation) the set point shall be set to establish the total draft necessary to control the corresponding portion of the process which is occurring on each vessel during the overlap. For example, minimum set point while charging at one vessel and tapping at the other would be equal to that necessary to establish a flow of 700,000 cfm (i.e., 550,000 + 150,000).

iii. Overlapping operations of the BOF vessels is allowed only as specified in operating permit application number 72080043.

iv. The BOF capture system shall be operated at the above minimum set points until and unless the Agency approves a lower minimum setpoint based on a demonstration that a better level of particulate matter control will occur, except for purposes of emissions testing as related to the set point.

b. The Permittee shall calibrate, operate, and maintain a continuous strip chart recorder of the stack gas flow rate as measured by the stack gas flow meter during ESP use.

c. The Permittee shall record for each steel production cycle the various stack gas flow rates for each process (i.e., for each charge, each refine, each tap) of each steel production cycle. That is, the Permittee shall be able to distinguish the measured flow rate of stack gas during each production cycle.

d. The stack gas flow meter shall be calibrated on at least a quarterly basis.

13a. Within 270 days of the date issued of this permit, the Permittee shall install, calibrate, operate, and maintain a monitoring device that continually measures and records for each process (i.e., for each charge, each refine, each tap) of each steel production cycle the various exhaust ventilation rates or levels of exhaust ventilation through the main downcommer duct of the ESP emissions capture and transport system.

b. The monitoring system shall be designed to be used as a mechanism to ensure sufficient draft is maintained in the emissions capture hoods and transport ducts so as to maximize emissions capture and transport and minimize uncaptured emissions and emission leaks.

c. The monitoring system shall be operated, tested and maintained to ensure accurate and useful data.

d. The Agency may allow an equivalent system or method instead of the above monitoring system provided the Permittee demonstrates, and the Agency approves, that such system or method will ensure sufficient draft is maintained in the emissions capture hoods and transport ducts so as to maximize emissions capture and transport and minimize uncaptured emissions and emission leaks in an equivalent manner, and that such system or method can be installed and operated within the time period required for the monitoring system as stated in this permit.

14a. The Permittee shall visually inspect BOF vessel enclosures, at least monthly all visible hooding, and ducts used to capture and transport emissions for the BOF ESP control system.

b. A log shall maintained of these inspections which includes observations of the physical appearance of the capture system and any noted deficiencies (e.g., the presence of any holes in ductwork or hoods, flow constrictions caused by dents or accumulated dust in ductwork, and fan erosion).

c. Any leaks or areas otherwise noted to be in need of repair, shall be repaired as soon as practicable.

15a. The Permittee shall operate, maintain, and repair the BOF ESP in a manner that assures compliance with the conditions of this permit.

b. An adequate inventory of spare parts for the BOF ESP shall be maintained.

16. Written operating procedures for the BOF ESP shall be maintained and updated describing proper normal process and equipment operating parameters, monitoring and instrumentation for measuring control equipment operating parameters, control equipment inspection and maintenance practices, and the availability of spare parts from inventory, local suppliers and other sources.

17. The Permittee shall keep operating records, a maintenance log, and inspection log for the BOF ESP and associated control systems which includes the following:

i. Operating time of the BOF;

ii. Operating time of the capture systems and performance parameters, including air flow and fan amperage through each fan motor, gas temperature at inlet to ESP, and steam injection rate, damper settings.

iii. Operating time of the ESP and performance parameters, including voltages and amperages of each ~~section~~, transformer/rectifier set number of sections in use;

iv. All routine and nonroutine maintenance performed, including dates and duration of outages, inspection schedule and findings, leaks detected, repair actions, and replacements.

Fan, do not They do not have currently the capability to monitor air flow for each fan !!

18. Emissions from the BOF Shop shall not exceed the limits in attached Tables 2 and 5.

Note: For purposes of this permit, a BOF cycle is defined as the period from the beginning of the charging process through the end of the tapping process. The cycle is comprised of three main processes which are charging, refining, and tapping.

CONTINUOUS CASTING OPERATIONS

19. The continuous casting operations shall comply with 35 Ill. Adm. Code 212.450, and 212.458(b)(8).

20. Emissions from the continuous casting operations shall not exceed the limits in Tables 3 and 5.

FUEL COMBUSTION

21. Total fuel usage for blast furnace stoves (A and B), boilerhouse boilers (1-10), blast furnace boilers (11 and 12), ladle drying preheaters and blast furnace gas flares shall not exceed the following limits:

i. Natural Gas usage: 190 million ft3 per month and 1,145 million ft3 per year;

ii. Blast Furnace Gas (BFG) usage: 30,800 million ft3 per month and 185,030 million ft3 per year;

iii. Fuel Oil usage: 60 thousand gallons per month and 365 thousand gallons per year.

22. Emissions from the fuel combustion units listed above shall not exceed the limits in Tables 4 and 5.

ON-SITE FUGITIVE DUST CONTROL

(Refer to Attachment B for a table which summarizes the required on-site fugitive dust roadway control measures and maps indicating the referred to road segments)

23. The Permittee shall immediately initiate and maintain the on-site fugitive dust control measures specified in this permit.

24a. The Permittee shall sweep or flush at least every day the paved access area below the BOF ESP where ESP dust collection bags are used, stored and transported.

b. The Permittee shall implement a housekeeping program for the non-roadway areas below and around the BOF ESP. This program shall, at a minimum, contain the following:

i. The ground and other accessible areas where dust may gather shall be swept or cleaned at least every day;

ii. Cleaning shall be performed in such a manner as to minimize the escape of dust into the atmosphere;

iii. Dust collection bags shall be inspected at least daily for rips, tears, or insecure connection to the discharge chutes of the ESP hoppers;

iv. Dust collection bags shall be inspected after removal from, and connection to, the discharge chutes of the ESP hoppers;

v. Ripped or torn bags shall be taken out of service and transported as soon as practicable in a covered truck so as to eliminate dust spillage on in-plant and out-of-plant roadways.

25. Fugitive emissions of particulate matter from any roadway or parking area shall not exceed an opacity of 5%, pursuant to 35 Ill. Adm. code 212.316(e)(1).

26a. UNPAVED ROADS: On unpaved roads that are part of normal traffic patterns as identified in attachment B (including roads B, C, E, N, F-F, and CS(2)) the Permittee shall apply a chemical dust suppressant at least three times a month, with the following exceptions:

i. Road segment G-G, which shall be sprayed at least quarterly;

ii. Road segments P, V, Z, D-D, E-E, and H, which shall be sprayed at least 4 times per month until paving is completed. Paving shall be completed on these roads no later than July 31, 1996;

iii. Road segment L, which shall be sprayed at least 4 times per month.

b. All other unpaved roads shall be treated as necessary.

c. Applications of suppressant may be less frequent than specified above if weather conditions, i.e., precipitation or temperature, interfere with the schedule for spraying, provided each such instance shall be recorded in accordance with the daily records for on-site fugitive dust control required by this permit.

27a. PAVED ROADWAYS AND AREAS: Paved roadways and areas shall be maintained in good condition.

b. On paved roadways and other areas, the Permittee shall sweep or flush as follows:

i. Road segments D, K, M, F, G, J, R, and O shall be swept or flushed at least daily;

ii. Road segments P, V, W, X, Z, D-D, E-E, and CS(1) shall be swept or flushed at least five days per week;

iii. Road segments S and T shall be swept or flushed at least every other day;

iv. Road segments A and H shall be swept or flushed at least once per month;

v. All gate areas leading from the Steelworks area shall be swept or flushed at least daily;

vi. All gate areas leading from the Ironmaking area shall be swept or flushed at least five times per week.

28. The above on-site dust control measures shall be conducted to maximize their effectiveness by performing said measures when the roads or areas are not normally obstructed by parked vehicles and by preferentially using filter sweeping (e.g., Enviro-Whirl sweeper) for the gate areas, the roads and areas surrounding the BOF and BOF ESP, and other key areas.

29. The Permittee shall maintain daily records relative to the on-site fugitive dust control program which includes the following information as a minimum:

i. The date (and time for the gate areas) each road or area was treated;

ii. The manner in which the road or area was treated (i.e., filter sweep, conventional sweep, suppressant spray or flush);

iii. Detailed information for use of dust suppressant, including but not limited to the application rate, dilution ratio, type of suppressant used, and the number of gallons of suppressant applied;

iv. Observations, if any, concerning the condition of the roadway, e.g., presence of parked vehicles, detection of potholes;

v. The amount of precipitation and temperature recorded for each day, and if determination was made to suspend application of suppressant, include name and title of person who made determination to suspend application and explanation;

vi. Any and all suspensions or deviations from the designated control procedures, with date, description, and explanation for suspension of application.

OFF-SITE FUGITIVE DUST CONTROL

30. The Permittee or the Permittee's Agent shall sweep or flush the following Granite City street road areas:

i. At least weekly, the quarter mile segment of ~~16th~~ Madison Avenue ~~street~~ in front of the 16th street gate (i.e., 1/8 of a mile in either direction);

ii. At least weekly, segment of 20th street between Lee and Quincy roads;

iii. At least monthly, segment of 20th street between Madison and Route 203 (a.k.a. Edwardsville Road).

PM-10 CONTINGENCY MEASURES

31. The Permittee shall comply with the additional control measures (e.g., PM-10 contingency plan) required by 35 Ill Adm. Code Part 212 Subpart U.

COMPLIANCE DETERMINATIONS

32a. Compliance with the daily limits of this permit shall be determined from a monthly total of the relevant daily data divided by the number of days in the month.

b. Compliance with the monthly limits of this permit (e.g., fuel usage) shall be determined by direct comparison of monthly data to the applicable limit.

c. Compliance with the annual limits of this permit shall be determined on a monthly basis from the sum of the data for the current month plus the preceding 11 months (running 12 month total), except that compliance with annual iron and steel production limits shall be determined based on a calendar year.

33a. Compliance with opacity limits and measurements of opacity shall be made by opacity readings taken in accordance with the observation procedures set out in 40 CFR Part 60, Appendix A, Method 9.

b. The Permittee shall have at least two employees or agents experienced in making opacity readings to the extent that it is reasonably possible to do so, who

Jim, didn't we decide to require that these employees be certified (based on comments at the hearing)?

shall be able to make the opacity readings required by this permit.

34a. Blast furnace hot metal production shall be measured at the BOF hot metal transfer station, and adjusted by documented slag and iron losses.

b. BOF liquid steel production shall be initially measured by a scale equipped crane and adjusted based upon documented steel production analysis of the continuous casters.

c. BFG usage shall be calculated based on 0.0497 mmft3 BFG generated per net ton of hot metal produced.

d. Natural gas usage shall be determined by metered volumes.

e. Fuel oil usage shall be determined by tank height differentials.

RECORD KEEPING

35. The Permittee shall keep records of the following items and such other items which may be appropriate to allow the Agency to review compliance:

i. Blast Furnace hot metal production (total combined daily, monthly and annual in tons), including documentation on iron and slag losses;

ii. BOF liquid steel production (total combined daily, monthly and annual in tons), including documentation on adjustments made due to production analysis and losses;

iii. Fuel usage as follows; Usage of natural gas and BFG (total combined million ft3 per month and year, each) and fuel oil (total combined gallons/month and year) for the blast furnace stoves (A and B), boilerhouse boilers (1-10), blast furnace boilers (11 and 12), ladle drying preheaters and blast furnace gas flares.

36. All records and logs required by this permit shall be retained at a readily accessible location at the source for at least three years from the date of entry and shall be made available for inspection and copying by the Agency and USEPA upon request. Any records retained in a computer shall be capable of

being retrieved and printed on paper during normal source office hours so as to be able to respond to an Agency request for records during the course of a source inspection.

STARTUP AND TESTING

37. The special conditions of this permit supplement the special conditions of any existing operating permits for this source, and supersede such conditions in cases where a conflict exists.

38. Operation at the increased production rates specified in this permit is allowed for 270 days from the date issued under this construction permit.

39a. The following tests shall be performed to demonstrate compliance with the conditions of this permit within 270 days from the date issued of this permit:

A. Blast Furnace testing: The emissions of particulate matter, volatile organic material, sulfur dioxide, nitrogen oxides, and the opacity from the blast furnace casthouse stack shall be measured. These tests shall be designed to verify compliance with 35 Ill. Adm. Code 212.445 and the requirements of this permit;

B. Hot Metal Desulfurization testing: The emissions of particulate matter from the desulfurization baghouse shall be measured. These tests shall be designed to verify compliance with the requirements of this permit; and 35 IAC 212.446(b)(2)

C. BOF testing: The emissions of particulate matter, carbon monoxide, and lead from the BOF ESP stack, and the opacity from both the BOF ESP stack and BOF Shop shall be measured. These tests shall be designed to verify compliance with 35 Ill. Adm. Code 212.446, 212.458 and the requirements of this permit;

D. Fuel Combustion Units testing: The emissions of particulate matter from a representative boiler while burning blast furnace gas shall be measured. This test shall be designed to verify compliance with the requirements of this permit and the emission factor used (i.e., 2.9 lbs particulate emitted per mmcf BFG burned);

E. BFG generation testing: The amount of blast furnace gas generated (mmft3) per ton of hot metal produced shall be determined. The Agency may waive this requirement for testing providing the Permittee submit a sufficient explanation of how BFG generation is determined with justification that such determination is appropriate for purposes of compliance determinations with this permit.

b. These tests shall be performed by an approved independent testing service during conditions which are representative of maximum emissions and at the maximum production rates allowed, or as close to such rates as reasonable if the Permittee demonstrates to the Agency prior to testing that testing at such production rates within the time constraints of an Agency request to test is not practicable.

ci. The following methods and procedures shall be used for the testing, unless another method is approved by the Agency: Refer to 40 CFR 60, Appendix A for USEPA test methods;

Location of sample points	USEPA Method 1
Gas flow and velocity	USEPA Method 2
Particulate Matter	USEPA Method 5
Sulfur Dioxide	USEPA Method 6
Nitrogen Oxides	USEPA Method 7
Opacity	USEPA Method 9
Carbon Monoxide	USEPA Method 10
Lead	USEPA Method 12

ii. All particulate measured shall be considered PM-10 unless emissions are tested by an appropriate USEPA test method for measurement of PM-10, as specified in 35 Ill. Adm. Code 212.110(e).

d. At least 60 days prior to the actual date of testing of the BOF, a written test plan shall be submitted to the Agency for review and approval. This plan shall be describe the specific procedures for testing the BOF, including as a minimum:

i. The persons who will be performing sampling and analysis and their experience with similar tests;

ii. The specific conditions under which testing will be performed including a discussion of why these conditions will be representative of maximum

emissions and the means by which operating parameters for the source and the emissions capture and control system will be determined;

iii. The specific determinations of emissions and operation which are intended to be made, including sampling and monitoring locations;

iv. The test methods which will be used, with the specific analysis methods;

v. Any proposed use of an alternative test method, with detailed justification;

vii. The format and content of the Source Test Report.

e. The Agency shall be notified before these tests to enable the Agency to observe these tests. Notification for the expected date of testing shall be submitted a minimum of thirty (30) days prior to the expected date. Notification of the actual and expected time of testing shall be submitted a minimum of five (5) working days prior to the actual date of the test. The Agency may at its discretion accept notifications with shorter advance notice provided that the Agency will not accept such notifications if it interferes with the Agency's ability to observe testing.

f. The Final Report of these tests shall include as a minimum:

i. A tabular summary of results which includes:
- process weight rate and/or fuel usage rate
- production rate
- allowable emission limit
- measured emission rate
- determined emission factor
- compliance demonstrated - Yes/No
- other pertinent information (~~i.e.~~ eg. for the BOF, pulpit set point for each process of the BOF cycle - charging, refining, and tapping);

ii. Description of test methods and procedures used, including description of sampling train, analysis equipment, and test schedule;

iii. Detailed description of test conditions, including,
- pertinent process information (e.g. fuel or raw material consumption)

- control equipment information, i.e. equipment condition and operating parameters during testing;

iv. Data and calculations, including copies of all raw data sheets and records of laboratory analyses, sample calculations, and data on equipment calibration;

g. Copies of the Final Report for these tests shall be submitted to the Agency within 14 days after the test results are compiled and finalized and in no case later than upon the submittal of the operating permit application for this production increase.

h. Submittals of information shall be made as follows:

i. Notice of Test - one copy to Source Emission Test Specialist, one copy to Regional Office, and one copy to Permit Section;

ii. Final Report - one copy to Source Emission Test Specialist, one copy to Regional Office, and one copy to Permit Section.

Pertinent Addresses are:

REPORTING

40. If there is an exceedance of the requirements of this permit as determined by the records required by this permit, the Permittee shall submit a report to the Agency's Compliance Unit in Springfield, Illinois within 30 days after the exceedance. The report shall include the emissions released in accordance with the record keeping requirements, a copy of the relevant records, and a description of the exceedance or violation, cause of the exceedance, and efforts to reduce emissions and future occurrences. This report shall be sent to:

Illinois EPA
Bureau of Air
Compliance Unit
P.O. Box 19276
Springfield, IL 62794-9276

41. The Permittee shall submit the following additional information from the prior calendar year with the Annual Emissions Report, due May 1st of each year:

i. Iron and steel production (tons/month and tons/yr, each);

ii. Natural gas and BFG usage (mmft3/month and mmft3/yr, each);

iii. Fuel oil usage (thousand gallons/month and thousand gallons/yr, for each type of oil).

APPLICABILITY OF MAJOR SOURCE RULES

42a. As a consequence of the above conditions, this permit is issued based upon the following changes in emissions, as further described in Table 6, accompanying increased production as allowed by this permit:

i. The increases in emissions of lead and VOM are not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration;

ii. The increase in emissions of NOx are being accompanied by contemporaneous emission decreases provided by the shutdown of equipment and operations such that the net emissions change is not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration.

iii. The increase in emissions of PM and PM-10 are being accompanied by contemporaneous emission decreases provided by additional road dust control and BOF capture and control such that the net emissions change is not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration.

Also, the Permittee has agreed to provide further additional dust control consisting of the sweeping of Granite City public streets and housekeeping measures in the area below and surrounding the BOF ESP. Attachment C is a listing of the emission reductions provided by these control measures.

b. The increases in emissions of SO2 and CO are significant under 40 CFR 52.21 - Prevention of Significant Deterioration (PSD). Accordingly, the project is considered a major modification and must comply with the requirements of PSD. These requirements include a demonstration of best available control requirements for affected SO2 and CO emission units, an analysis of air quality impacts, an analysis of the impacts of the project on visibility, vegetation's and soils, and the application and proposed permit must undergo a public participation. The Agency has determined that these additional requirements have been met.

c. The changes in emissions pertinent to this project are summarized as follows:

Units = tons/year

- Emission increases which could occur from the project:

PM-10	PM	NOx	SO2	CO	VOM	Lead
51.6	(-60.6)	238.8	475.8	5,685	59.3	0.54

- Creditable contemporaneous actual emission decreases:

PM-10	PM	NOx	SO2	CO	VOM	Lead
58.0	58.0	226.5	0.38	23.31	32.8	0.0

- Other contemporaneous emission increases:

PM-10	PM	NOx	SO2	CO	VOM	Lead
20.4	20.6	18.4	0.2	10.2	1.2	0.0

- Net emission changes:

PM-10	PM	NOx	SO2	CO	VOM	Lead
+14.0	-98.0	+30.7	+475.6	+5,672	+27.7	+0.54

- Significant Levels:

PM-10	PM	NOx	SO2	CO	VOM	Lead
15	25	40	40	100	40	0.6

Explanatory Note:
PM = particulate matter = particulate;
PM-10 = particulate matter less than or equal to 10 micrometers in size;
SO2 = sulfur dioxide;
NOx = nitrogen oxides;
VOM = volatile organic material;
CO = carbon monoxide;
mm = million;
gr/dscf = grains per dry standard cubic foot;
acfm = actual cubic feet per minute;
mmcf = million cubic feet;
Mgal = thousands of gallons.

If you have any questions on this permit, please call Jim Ross at 217/782-2113.

Donald E. Sutton, P.E.
Manager, Permit Section

ATTACHMENT A

PROCEDURES TO ENSURE PROPER OPERATION
OF BOF ESP CONTROL SYSTEM

1. The emissions control operator shall:

a. Check on a regular basis and report to the emissions control foreman or melter:

i. Any ESP fields down;

ii. Any ESP fields in which the meter readings are showing no current or a fault;

b. Check on a regular basis that doors on all hopper screws are closed;

c. Inspect on a regular basis the fans and motors for unusual sounds and/or visual problems. Any abnormalities will be immediately reported to the melter or maintenance foreman for investigation.

2. The melter shall:

a. Check on a regular basis and report to the emissions control foreman or the area electrician any fields which the pulpit precipitator field short indicators shows as having a short and is able to reset;

b. Check on a regular basis and report to the emissions control foreman or the maintenance foreman any draft or fan problems;

c Check the ESP stack opacity monitor on a regular basis and initiate the following in the event that the stack opacity level, as determined by the opacity monitor, exceeds 30% opacity on a six minute average:

i. Check the pulpit indicators for proper operation of the steam and spray water system. Report any problems to emission control foreman or maintenance foreman;

ii. Check the stack gas pulpit set point for proper setting;

iii. Call the emissions control operator who shall perform the following steps;

Permit Application #95010001

ATTACHMENT A (cont.)

A. Check the AVC operation and power level. Report any problems to electrical maintenance foreman or area electrician;

B. Check to ensure that doors on all hopper screws are closed;

d. Check oxygen blow rates and adjust, if necessary;

e. Check hot metal chemistry;

f. A log shall be maintained of the above checks and any actions taken as a result.

3. The emission control foreman shall:

a. Check on a regular basis the opacity monitor exceedances and trends. The control specialist shall be contacted to correct any problems;

b. Check on a regular basis the draft rate set points;

c. Check on a regular basis primary and secondary damper settings;

d. Check on a regular basis ESP operation, including the following:

A. Fields down;

B. Fields indicating shorts and unable to reset;

C. Hopper screw doors are closed;

e. Check on a regular basis blow rates;

f. Check on a regular basis spray water system operation;

g. Check on a regular basis steam injection rate;

h. Contact the area manager regarding electrical maintenance and to schedule the ESP repair work;

Permit Application #95010001

ATTACHMENT A (cont.)

i. Contact the area manger for mechanical maintenance to schedule the isolation of the ESP channel by closing the inlet and outlet gates of that chamber and opening the top hatches for entry into the chamber;

j. Notify the emissions control operator and melter when isolation work begins;

k. A log shall be maintained of the above checks and any actions taken as a result.

4. The crane operator shall use the following procedures, as appropriate, to minimize emissions and maximize emissions capture by the hoods:

a. Use controlled pouring of the hot metal into the BOF vessel;

b. Use careful positioning of the hot metal ladle with respect to the hood face and furnace mouth;

c. Use the most beneficial furnace tilt angle;

d. These procedures shall be posted in the crane operator booth.

ATTACHMENT C

CONTEMPORANEOUS REDUCTIONS IN THE EMISSIONS OF PM-10

- Historic roadway emissions of 428 tons/yr, minus Future potential roadway emissions of 27 tons/yr, equals a resulting reduction in roadway emissions of 401 tons/yr

- Historic material handling emissions of 17 tons/yr minus Future potential material handling emissions of 2 tons/yr, equals a resulting reduction in material handling emissions of 15 tons/yr.

- Emission reductions resulting from the sweeping of city streets = 52 tons/yr*

- Emission reductions resulting from sweeping and housekeeping of areas below and around BOF ESP = 12 tons/yr*

Total reductions in the emissions of PM-10 as a result of the additional dust control measures required by Illinois' SIP and the special conditions of this permit = 480 tons/yr

*These are considered reasonable estimates of reductions and are subject to change upon further investigation of the actual reductions which will occur as a result of the control measures required by this permit.

ENVIRONMENTAL PROTECTION AGENCY
DIVISION OF AIR POLLUTION CONTROL
2200 CHURCHILL ROAD
SPRINGFIELD, ILLINOIS 62706

STANDARD CONDITIONS FOR OPERATING PERMITS

July 1, 1985

The Illinois Environmental Protection Act (Illinois Revised Statutes, Chapter 111-1/2, Section 1039) grants the Environmental Protection Agency authority to impose conditions on permits which it issues.

The following conditions are applicable unless superseded by special permit condition(s).

1. The issuance of this permit does not release the permittee from compliance with state and federal regulations which are part of the Illinois State Implementation Plan, as well as with other applicable statutes and regulations of the United States or the State of Illinois or with applicable local laws, ordinances and regulations.

2. The Agency has issued this permit based upon the information submitted by the permittee in the permit application. Any misinformation, false statement or mispresentation in the application shall be grounds for revocation under 35 Ill. Adm. Code 201.207.

3. a. The permittee shall not authorize, cause, direct or allow any modification, as defined in 35 Ill. Adm. Code 201.102, of equipment, operations or practices which are reflected in the permit application as submitted unless a new application or request for revision of the existing permit is filed with the Agency and unless a new permit or revision of the existing permit(s) is issued for such modification.

   b. This permit only covers emission sources and control equipment while physically present at the indicated plant location(s). Unless the permit specifically provides for equipment relocation, this permit is void for an item of equipment on the day it is removed from the permitted location(s) or if all equipment is removed, notwithstanding the expiration date specified on the permit.

4. The permittee shall allow any duly authorized agent of the Agency, upon the presentation of credentials, at reasonable times:

   a. to enter the permittee's property where actual or potential effluent, emission or noise sources are located or where any activity is to be conducted pursuant to this permit,

   b. to have access to and to copy any records required to be kept under the terms and conditions of this permit,

   c. to inspect, including during any hours of operation of equipment constructed or operated under this permit, such equipment and any equipment required to be kept, used, operated, calibrated and maintained under this permit,

   d. to obtain and remove samples of any discharge or emission of pollutants, and

   e. to enter and utilize any photographic, recording, testing, monitoring or other equipment for the purpose of preserving, testing, monitoring or recording any activity, discharge or emission authorized by this permit.

5. The issuance of this permit:

   a. shall not be considered as in any manner affecting the title of the premises upon which the permitted facilities are located,

   b. does not release the permittee from any liability for damage to person or property caused by or resulting from the construction, maintenance, or operation of the facilities,

c. does not take into consideration or attest to the structural stability of any unit or part of the project, and

d. in no manner implies or suggests that the Agency (or its officers, agents or employees) assumes any liability, directly or indirectly, for any loss due to damage, installation, maintenance, or operation of the proposed equipment or facility.

6. The facilities covered by this permit shall be operated in such a manner that the disposal of air contaminants collected by the equipment shall not cause a violation of the Environmental Protection Act or regulations promulgated thereunder.

7. The permittee shall maintain all equipment covered under this permit in such a manner that the performance of such equipment shall not cause a violation of the Environmental Protection Act or regulations promulgated thereunder.

8. The permittee shall maintain a maintenance record on the premises for each item of air pollution control equipment. This record shall be made available to any agent of the Environmental Protection Agency at any time during normal working hours and/or operating hours. As a minimum, this record shall show the dates of performance and nature of preventative maintenance activities.

9. No person shall cause or allow continued operation during malfunction, breakdown or startup of any emission source or related air pollution control equipment if such operation would cause a violation of an applicable emission standard or permit limitation. Should a malfunction, breakdown or startup occur which results in emissions in excess of any applicable standard or permit limitation, the permittee shall:

   a. immediately report the incident to the Agency's Regional Field Operations Section Office by telephone, telegraph, or other method as constitutes the fastest available alternative, and shall comply with all reasonable directives of the Agency with respect to the incident;

   b. maintain the following records for a period of no less than two (2) years:

      i. date and duration of malfunction, breakdown or startup,

      ii. full and detailed explanation of the cause,

      iii. contaminants emitted and an estimate of quantity of emissions,

      iv. measures taken to minimize the amount of emissions during the malfunction, breakdown or startup, and

      v. measures taken to reduce future occurrences and frequency of incidents.

10. If the permit application contains a compliance program and project completion schedule, the permittee shall submit a project completion status report within thirty (30) days of any date specified in the compliance program and project completion schedule or at six month intervals, whichever is more frequent.

11. The Permittee shall submit an Annual Emission Report as required by 35 Ill. Adm. Code. 201.302 and 35 Ill. Adm. code Part 254.

OPERATING PERMIT

PERMITTEE

Granite City Division
of National Steel Corporation
Attn: Joseph S. Kocot
20th and State Street
Granite City, Illinois 62040

Application No.: 95010001
Applicant's Designation:
Subject: Production Increase
Date Issued: June 6, 1997
Location: Southeastern Granite City

I.D. No.: 119813AAI
Date Received: February 18, 1997

Expiration Date: June 6, 2002

Permit is hereby granted to the above-designated Permittee for an increase in the allowable production rate of iron (from 2,372,500 to 3,165,000 net tons per year) and steel (from 2,774,000 to 3,580,000 net tons per year) as described in the above-referenced application. This permit is subject to standard conditions attached hereto and the following special conditions:

1. Prior to issuance of this permit, a draft of this permit has undergone a public notice and comment period, and a public hearing was held.

BLAST FURNACE OPERATIONS

2a. Total combined production of hot metal (a.k.a., iron) from blast furnaces A and B shall not exceed 9,849 net tons per day, averaged over any calendar month, and;

b. Total combined production of hot metal from blast furnaces A and B shall not exceed 3,165,000 net tons per year.

3a. Particulate emissions from the blast furnace casthouse baghouse and iron spout baghouse shall not exceed 0.010 gr/dscf, pursuant to 35 Ill. Adm. Code 212.445(b)(1).

b. The opacity of emissions from the blast furnace casthouse baghouse and the iron spout baghouse shall not exceed 10% on a 6 minute rolling average basis, pursuant to 35 Ill. Adm. Code 212.445(b)(1).

4a. Emissions of particulate matter from any opening in the blast furnace casthouse shall not exceed 20% opacity on a 6-minute rolling average basis beginning from initiation of the opening of the tap hole up to the point where iron and slag stops flowing in the troughs, pursuant to 35 Ill. Adm. Code 212.445(a)(2).

5. Emissions from Blast Furnace operations shall not exceed the limits in attached Tables 1 and 5.

Printed on Recycled Paper

BASIC OXYGEN FURNACE SHOP

6a. Total combined production of liquid steel from the Basic Oxygen Furnaces (BOF's) shall not exceed 11,000 net tons per day, averaged over any calendar month, and;

b. Total combined production of liquid steel from the BOF's shall not exceed 3,580,000 net tons per year.

7. The emissions of PM-10 from the BOF ESP stack for the total of all BOF processes (i.e., operations from the beginning of the charging process through the end of the tapping process) shall not exceed 60.0 lbs/hr and 0.225 lbs per ton of steel in process, pursuant to 35 Ill. Adm. Code 212.458(b)(23).

8. Visible emissions from any opening in the BOF shop (e.g., roof monitor) shall not exceed 20% on a 3 minute rolling average basis.

9a. The Permittee shall determine the opacity from the openings BOF shop on at least a weekly basis. Observations shall be conducted for at least an hour or the entire BOF cycle, whichever is greater.

b. The Permittee shall determine the opacity from the BOF ESP stack for at least one hour on any normal work day (i.e., Monday through Friday) that the continuous opacity monitor on the BOF ESP stack has an outage that exceeds two consecutive hours and is still down. The readings shall commence as soon as possible after the opacity monitor has been down for two consecutive hours. If meteorological conditions or lack of visibility preclude these observations from being conducted, then this shall be noted in the log book.

c. The opacity shall be determined in accordance with the observation procedures set out in 40 CFR Part 60, Appendix A, Method 9 including the requirement that readings be taken by a certified observer.

d. These determinations shall be recorded in a log book, which at a minimum shall include the date and time of observations, name and title of observer, individual opacity readings, calculated opacity so as to determine compliance with Section 212.123, and calculated opacity relative to 20% opacity on a three minute rolling average basis.

10. The Permittee shall follow the BOF operating procedures and requirements specified in attachment A. These requirements are designed to ensure proper operation of the BOF control system. These procedures shall be posted in the BOF pulpit (a.k.a., control room).

11. Flame suppression shall be used and maintained during the entire tapping process.

12a. The stack gas pulpit set point of the BOF ESP control system shall be set in accordance with the following, so as to establish sufficient particulate matter capture efficiency of the charging and primary hoods:

i. Set point requirements while only a single BOF vessel is in operation;

A. Minimum set point during charging process: 550,000 cfm;

B. Minimum set point during refining process: 650,000 cfm;

C. Minimum set point during tapping process: 200,000 cfm (until one minute after completing alloy addition);

b. i. During dual operation of BOF vessels (a.k.a., overlapping BOF operation) the minimum set point shall be 700,000 cfm.

iii. Overlapping operations of the BOF vessels is allowed under the following conditions:

A. The hot metal charge of the second vessel shall be initiated and completed during the time between completion of the blow and start of tap on the first vessel while sufficient draft at the ESP capture system is established and maintained for both vessels.

B. The charge and/or blow on one vessel shall not begin until sufficient draft has been established at the associated ESP capture system (a.k.a., doghouse) and the alloy addition at the vessel tapping has been completed for a least 1 minute.

C. Sufficient draft at the ESP capture system of the vessel being tapped shall be maintained for at least 1 minute after alloy addition has been completed. After such period, the capture system draft may be transferred over to the other vessel in order to satisfy condition (A) above.

D. Only overlapping of the hot metal charge of the second vessel after the end of blow and prior to onset of tap of the first vessel

and

overlapping of tapping of the first vessel, after alloy addition, and the hot metal charge and/or blow on the second vessel are allowed.

E. Condition B and C above shall be part of the Standard Operating Procedure (SOP) of the BOF vessels.

c. The BOF capture system shall be operated at the above minimum set points until and unless the Agency approves a lower minimum set point based on a demonstration that a better level of particulate matter control will occur, except for purposes of emissions testing as related to the set point.

d. The Permittee shall calibrate, operate, and maintain a continuous strip chart recorder of the ESP stack gas flow rate as measured by the stack gas flow meter during ESP use.

e. The Permittee shall record for each steel production cycle the various stack gas flow rates for each process (i.e., for each charge, each refine, each tap) of each steel production cycle. That is, the Permittee shall be able to distinguish the measured flow rate of stack gas during each production cycle.

f. The stack gas flow meter shall be calibrated on at least a quarterly basis.

13a. The Permittee shall operate and maintain the waste gas suction monitor system that continually measures and records for each process (i.e., for each charge, each refine, each tap) of each steel production cycle the static pressure in the main downcommer duct of the ESP emissions capture and transport system.

b. The waste gas suction monitoring system shall be used as a mechanism to ensure sufficient draft is maintained in the emissions capture hoods and transport ducts so as to maximize emissions capture and transport and minimize uncaptured emissions and emission leaks.

c. The monitoring system shall be operated and maintained to ensure accurate and useful data.

d. The Permittee shall continuously record the static pressure in the main downcommer duct of the ESP emissions capture and transport system.

14a. The Permittee shall visually inspect at least monthly all visible BOF vessel enclosures, hooding and ducts used to capture and transport emissions for the BOF ESP control system.

b. A log shall maintained of these inspections which includes observations of the physical appearance of the capture system and any noted deficiencies (e.g., the presence of any holes in ductwork or hoods, flow constrictions caused by dents or accumulated dust in ductwork, and fan erosion).

c. Any leaks or areas otherwise noted to be in need of repair, shall be repaired as soon as practicable.

15a. The Permittee shall operate, maintain, and repair the BOF ESP in a manner that assures compliance with the conditions of this permit.

b. An adequate inventory of spare parts for the BOF ESP shall be maintained.

16. Written operating procedures for the BOF ESP shall be maintained and updated describing proper normal process and equipment operating parameters, monitoring and instrumentation for measuring control equipment operating parameters, control equipment inspection and maintenance practices, and the availability of spare parts from inventory, local suppliers and other sources.

17. The Permittee shall keep operating records, a maintenance log, and inspection log for the BOF ESP and associated control systems which includes the following:

a. Operating time of the BOF;

b. Operating time of the capture systems and performance parameters, including air flow and fan amperage through the fan motors, gas temperature at inlet to ESP, damper settings, and steam injection rate;

c. Operating time of the ESP and performance parameters, including voltage and amperage of each transformer/rectifier set, number of sections in use;

d. All routine and nonroutine maintenance performed, including dates and duration of outages, inspection schedule and findings, leaks detected, repair actions, and replacements.

18. Emissions from the BOF Shop shall not exceed the limits in attached Tables 2 and 5.

Note: For purposes of this permit, a BOF cycle is defined as the period from the beginning of the charging process through the end of the tapping process. The cycle is comprised of three main processes which are charging, refining, and tapping.

CONTINUOUS CASTING OPERATIONS

19. The continuous casting operations shall comply with 35 Ill. Adm. Code 212.450 and 212.458(b)(8).

20. Emissions from the continuous casting operations shall not exceed the limits in Tables 3 and 5.

FUEL COMBUSTION

21. Total fuel usage for blast furnace stoves (A and B), boiler house boilers (1-10), blast furnace boilers (11 and 12), ladle drying preheaters and blast furnace gas flares shall not exceed the following limits:

a. Natural Gas usage: 190 million ft^3 per month and 1,145 million ft^3 per year;

b. Blast Furnace Gas (BFG) usage: 30,800 million ft^3 per month and 185,030 million ft^3 per year;

c. Fuel Oil usage: 60 thousand gallons per month and 365 thousand gallons per year.

22. Emissions from the fuel combustion units listed above shall not exceed the limits in Tables 4 and 5.

ON-SITE FUGITIVE DUST CONTROL

(Refer to Attachment B for a table which summarizes the required on-site fugitive dust roadway control measures and maps indicating the referred to road segments)

23. The Permittee shall immediately initiate and maintain the on-site fugitive dust control measures specified in this permit so as eliminate dust spillage on in-plant and out-of-plant roadways.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

24a. The Permittee shall sweep or flush at least every day the paved access area below the BOF ESP where ESP dust collection bags are used, stored and transported.

b. The Permittee shall implement a housekeeping program for the non-roadway areas below and around the BOF ESP. This program shall, at a minimum, contain the following:

i. The ground and other accessible areas where dust may gather shall be swept or cleaned at least every day; on log sheet daily form report

ii. Cleaning shall be performed in such a manner as to minimize the escape of dust into the atmosphere;

iii. Dust collection bags shall be inspected at least daily for rips, tears, or insecure connection to the discharge chutes of the ESP hoppers; ch. when put on ch. when taken off operator

iv. Dust collection bags shall be inspected after removal from, and connection to, the discharge chutes of the ESP hoppers;

v. Ripped or torn bags shall be taken out of service and transported as soon as practicable in a covered truck.

25. Fugitive emissions of particulate matter from any roadway or parking area shall not exceed an opacity of 5%, pursuant to 35 Ill. Adm. code 212.316(e)(1).

26a. UNPAVED ROADS: On unpaved roads that are part of normal traffic patterns as identified in attachment B (including roads B, C, E, N, F-F, and CS(2)) the Permittee shall apply a chemical dust suppressant at least three times a month, with the following exceptions:

i. Road segment G-G, which shall be sprayed at least quarterly;

ii. Road segments P, V, Z, D-D, E-E, and H, which shall be sprayed at least 4 times per month until paving is completed. Paving shall be completed on these roads no later than July 31, 1996;

iii. Road segment L, which shall be sprayed at least 4 times per month.

b. All other unpaved roads shall be treated as necessary.

c. Applications of suppressant may be less frequent than specified above if weather conditions, i.e., precipitation or temperature, interfere with the schedule for spraying, provided each such instance shall be recorded in accordance with the daily records for on-site fugitive dust control required by this permit.

27a. PAVED ROADWAYS AND AREAS: Paved roadways and areas shall be maintained in good condition.

b. On paved roadways and other areas, the Permittee shall sweep or flush as follows:

i. Road segments D, K, M, F, G, J, R, and O shall be swept or flushed at least daily;

ii. Road segments P, V, W, X, Z, D-D, E-E, and CS(1) shall be swept or flushed at least five days per week;

iii. Road segments S and T shall be swept or flushed at least every other day;

iv. Road segments A and H shall be swept or flushed at least once per month;

v. All gate areas leading from the Steelworks area shall be swept or flushed at least daily;

vi. All gate areas leading from the iron making area shall be swept or flushed at least five times per week.

28. The above on-site dust control measures shall be conducted to maximize their effectiveness by performing said measures when the roads or areas are not normally obstructed by parked vehicles and by preferentially using filter sweeping (e.g., Enviro-Whirl sweeper) for the gate areas, the roads and areas surrounding the BOF and BOF ESP, and other key areas.

29. The Permittee shall maintain daily records relative to the on-site fugitive dust control program which includes the following information as a minimum:

a. The date (and time for the gate areas) each road or area was treated;

b. The manner in which the road or area was treated (i.e., filter sweep, conventional sweep, suppressant spray or flush);

c. Detailed information for use of dust suppressant, including but not limited to the application rate, dilution ratio, type of suppressant used, and the number of gallons of suppressant applied;

d. Observations, if any, concerning the condition of the roadway, e.g., presence of parked vehicles, detection of potholes;

e. The amount of precipitation and temperature recorded for each day, and if determination was made to suspend application of suppressant, include name and title of person who made determination to suspend application and explanation;

f. Any and all suspensions or deviations from the designated control procedures, with date, description, and explanation for suspension of application.

OFF-SITE FUGITIVE DUST CONTROL

30. The Permittee or the Permittee's Agent shall sweep or flush the following Granite City street road areas:

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

a. At least weekly, the quarter mile segment of Madison Avenue in front of the 16th street gate (i.e., 1/8 of a mile in either direction);

b. At least weekly, segment of 20th street between Lee and Quincy roads;

c. At least monthly, segment of 20th street between Madison and Route 203 (a.k.a. Edwardsville Road).

PM-10 CONTINGENCY MEASURES

31. The Permittee shall comply with the additional control measures (e.g., PM-10 contingency plan) required by 35 Ill Adm. Code Part 212 Subpart U.

COMPLIANCE DETERMINATIONS

32a. Compliance with the daily limits of this permit shall be determined from a monthly total of the relevant daily data divided by the number of days in the month.

b. Compliance with the monthly limits of this permit (e.g., fuel usage) shall be determined by direct comparison of monthly data to the applicable limit.

c. i. Compliance with the annual limits of this permit shall be determined based on a calendar year.

ii. A. Compliance with the production limits in conditions 2(b) and 6(b) shall also be determined on a month by month basis by showing that the actual production of iron and steel from the plant did not exceed the scheduled rate of production for a month given in the most recent production schedule provided to the Agency that shows compliance with the following requirements.

B. If no production schedule is submitted to the Agency by the Permittee for a particular year, the scheduled monthly production of iron and steel shall be set at one twelfth of the annual production limits in conditions 2(b) and 6(b).

C. 1. The Permittee may submit a schedule for iron and steel production for each month of the calendar year. Such schedule shall provide the scheduled monthly iron and steel production for each month and the total of such scheduled production shall not exceed the annual production limits in conditions 2(b) and 6(b). This schedule shall be submitted each year no later than December 15th of the preceding year.

2. During the course of the year, the Permittee may submit a revised production schedule which accounts for actual production levels which were below that scheduled for the previous months,

provided that in no case shall the scheduled production for prior months in such a revised schedule be lowered to less than actual production levels or raised. Such revised schedule shall be submitted to the Agency no later than 15 days after the first day of the month for which scheduled production has been raised. Such schedule shall be accompanied by data on actual production in preceding months.

33a. Compliance with opacity limits and measurements of opacity shall be made by opacity readings taken in accordance with the observation procedures set out in 40 CFR Part 60, Appendix A, Method 9.

b. The Permittee shall have at least two employees or agents experienced in making opacity readings to the extent that it is reasonably possible to do so, who shall be able to make the opacity readings required by this permit.

34a. Blast furnace hot metal production shall be measured at the BOF hot metal transfer station, and adjusted by documented slag and iron losses.

b. BOF liquid steel production shall be initially measured by a scale equipped crane and adjusted based upon documented steel production analysis of the continuous casters.

c. BFG usage shall be calculated based on the total BFG produced per net ton hot metal (NTHM) derived by the following formula and adjusted per analysis of documented BFG consumptions:

$$mmft^3\ BFG\ per\ month = \frac{(4.585277\ NTHM/day + 498.191)}{80} \times \begin{pmatrix} Number\ of \\ days\ in \\ that\ month. \end{pmatrix}$$

d. Natural gas usage shall be determined by metered volumes.

e. Fuel oil usage shall be determined by tank height differentials.

RECORD KEEPING

35. The Permittee shall keep records of the following items and such other items which may be appropriate to allow the Agency to review compliance:

a. Blast Furnace hot metal production (total combined daily, monthly and annual in tons), including documentation on iron and slag losses;

b. BOF liquid steel production (total combined daily, monthly and annual in tons), including documentation on adjustments made due to production analysis and losses;

c. Fuel usage as follows; Usage of natural gas and BFG (total combined million ft^3 per month and year, each) and fuel oil (total combined gallons/month and year) for the blast furnace

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

stoves (A and B), boiler house boilers (1-10), blast furnace boilers (11 and 12), ladle drying preheaters and blast furnace gas flares.

36. All records and logs required by this permit shall be retained at a readily accessible location at the source for at least three years from the date of entry and shall be made available for inspection and copying by the Agency and USEPA upon request. Any records retained in a computer shall be capable of being retrieved and printed on paper during normal source office hours so as to be able to respond to an Agency request for records during the course of a source inspection.

TESTING

37. The special conditions of this permit supplement the special conditions of any existing operating permits for this source, and supersede such conditions in cases where a conflict exists.

38a. The following tests shall be performed by no later than August 6, 1997 to demonstrate compliance with the conditions of this permit.

i. Fuel Combustion Units testing: The emissions of particulate matter from boiler #12 while burning blast furnace gas shall be measured. This test shall be designed to verify compliance with the requirements of this permit and the emission factor used (i.e., 2.9 lbs particulate emitted per mmcf BFG burned);

b. The test shall be performed by an approved independent testing service during conditions which are representative of maximum emissions and at the maximum production rates allowed, or as close to such rates as reasonable if the Permittee demonstrates to the Agency prior to testing that testing at such production rates within the time constraints of an Agency request to test is not practicable.

c. i. The following methods and procedures shall be used for the testing, unless another method is approved by the Agency: Refer to 40 CFR 60, Appendix A for USEPA test methods;

Location of sample points	USEPA Method 1
Gas flow and velocity	USEPA Method 2
Particulate Matter	USEPA Method 5

ii. All particulate measured shall be considered PM-10 unless emissions are tested by an appropriate USEPA test method for measurement of PM-10, as specified in 35 Ill. Adm. Code 212.110(e).

d. At least 30 days prior to the actual date of testing, a written test plan shall be submitted to the Agency for review and approval. This plan shall be describe the specific procedures for testing, including as a minimum:

i. The persons who will be performing sampling and analysis and their experience with similar tests;

ii. The specific conditions under which testing will be performed including a discussion of why these conditions will be representative of maximum emissions and the means by which operating parameters for the source and the emissions capture and control system will be determined;

iii. The specific determinations of emissions and operation which are intended to be made, including sampling and monitoring locations;

iv. The test methods which will be used, with the specific analysis methods;

v. Any proposed use of an alternative test method, with detailed justification;

vii. The format and content of the Source Test Report.

e. The Agency shall be notified before these tests to enable the Agency to observe these tests. Notification for the expected date of testing shall be submitted a minimum of thirty (30) days prior to the expected date. Notification of the actual and expected time of testing shall be submitted a minimum of five (5) working days prior to the actual date of the test. The Agency may at its discretion accept notifications with shorter advance notice provided that the Agency will not accept such notifications if it interferes with the Agency's ability to observe testing.

f. The Final Report of these tests shall include as a minimum:

i. A tabular summary of results which includes:

- process weight rate and/or fuel usage rate
- production rate
- allowable emission limit
- measured emission rate
- determined emission factor
- compliance demonstrated - Yes/No
- any other pertinent information

ii. Description of test methods and procedures used, including description of sampling train, analysis equipment, and test schedule;

iii. Detailed description of test conditions, including,

- pertinent process information (e.g. fuel or raw material consumption)
- control equipment information, i.e. equipment condition and operating parameters during testing;

iv. Data and calculations, including copies of all raw data sheets and records of laboratory analyses, sample calculations, and data on equipment calibration;

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

g. Copies of the Final Report for these tests shall be submitted to the Agency within 14 days after the test results are compiled and finalized.

h. Submittals of information shall be made as follows:

i. Notice of Test - one copy to Source Emission Test Specialist, one copy to Regional Office, and one copy to Permit Section;

ii. Final Report - one copy to Source Emission Test Specialist, one copy to Regional Office, and one copy to Permit Section.

REPORTING

39. If there is an exceedance of the requirements of this permit as determined by the records required by this permit, the Permittee shall submit a report to the Agency's Compliance Unit in Springfield, Illinois within 30 days after the exceedance. The report shall include the emissions released in accordance with the record keeping requirements, a copy of the relevant records, and a description of the exceedance or violation, cause of the exceedance, and efforts to reduce emissions and future occurrences. This report shall be sent to:

Illinois EPA
Bureau of Air
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

40. The Permittee shall submit the following additional information from the prior calendar year with the Annual Emissions Report, due May 1st of each year:

a. Iron and steel production (tons/month and tons/yr, each);

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

b. Natural gas and BFG usage ($mmft^3$/month and $mmft^3$/yr, each);

c. Fuel oil usage (thousand gallons/month and thousand gallons/yr, for each type of oil).

APPLICABILITY OF MAJOR SOURCE RULES

41a. As a consequence of the above conditions, this permit is issued based upon the following changes in emissions, as further described in Table 6, accompanying increased production as allowed by this permit:

i. The increases in emissions of lead and VOM are not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration;

ii. The increase in emissions of NO_x are being accompanied by contemporaneous emission decreases provided by the shutdown of equipment and operations such that the net emissions change is not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration.

iii. The increase in emissions of PM and PM-10 are being accompanied by contemporaneous emission decreases provided by additional road dust control and BOF capture and control such that the net emissions change is not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration.

Also, the Permittee has agreed to provide further additional dust control consisting of the sweeping of Granite City public streets and housekeeping measures in the area below and surrounding the BOF ESP. Attachment C is a listing of the emission reductions provided by these control measures.

b. The increases in emissions of SO_2 and CO are significant under 40 CFR 52.21 - Prevention of Significant Deterioration (PSD). Accordingly, the project is considered a major modification and must comply with the requirements of PSD. These requirements include a demonstration of best available control requirements for affected SO2 and CO emission units, an analysis of air quality impacts, an analysis of the impacts of the project on visibility, vegetation's and soils, and the application and proposed permit must undergo a public participation. The Agency has determined that these additional requirements have been met.

c. The changes in emissions pertinent to this project are summarized as follows:

Units = tons/year

- Emission increases which could occur from the project:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
51.6	- 52.0	238.8	476.0	5,685	59.3	0.54

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

- Creditable contemporaneous actual emission decreases:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
58.0	58.0	226.5	0.38	23.31	32.8	0.0

- Other contemporaneous emission increases:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
20.7	20.3	26.0	0.25	11.8	1.6	0.0

- Net emission changes:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
+14.3	-89.2	+38.3	+475.9	+5,673	+28.1	+0.54

- Significant Levels:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
15	25	40	40	100	40	0.6

Explanatory Note:

PM	=	particulate matter = particulate;
PM-10	=	particulate matter less than or equal to 10 micrometers in size;
SO_2	=	sulfur dioxide;
NO_x	=	nitrogen oxides;
VOM	=	volatile organic material;
CO	=	carbon monoxide;
mm	=	million;
gr/dscf	=	grains per dry standard cubic foot;
acfm	=	actual cubic feet per minute;
mmcf	=	million cubic feet;
Mgal	=	thousands of gallons.

Please note that this permit has been revised to allow additional time for operation under this construction permit, to reflect the use of the waste gas suction monitoring system, to revise the BFG usage determination method, and to remove the requirement for BFG generation testing.

If you have any questions on this permit, please call Ernie Kierbach at 217/782-2113.

TABLE 6

EMISSIONS SUMMARY

Units = tons/year

- Emission increases which could occur from the project:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
51.6	-52.0	238.8	476.0	5,685	59.3	0.54

- Creditable contemporaneous actual emission decreases:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
58.0	58.0	226.5	0.38	23.31	32.8	0.0

- Other contemporaneous emission increases:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
20.7	20.3	26.0	0.25	11.8	1.6	0.0

- Net emission changes:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
+14.3	-89.2	+38.3	+475.9	+5,673	+28.1	+0.54

- Significant Levels:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
15	25	40	40	100	40	0.6

Permit Application #95010001

ATTACHMENT A

PROCEDURES TO ENSURE PROPER OPERATION
OF BOF ESP CONTROL SYSTEM

1. The emissions control operator shall:

   a. Check on a regular basis and report to the emissions control foreman or melter:

      i. Any ESP fields down;

      ii. Any ESP fields in which the meter readings are showing no current or a fault;

   b. Check on a regular basis that doors on all hopper screws are closed;

   c. Inspect on a regular basis the fans and motors for unusual sounds and/or visual problems. Any abnormalities will be immediately reported to the melter or maintenance foreman for investigation.

2. The melter shall:

   a. Check on a regular basis and report to the emissions control foreman or the area electrician any fields which the pulpit precipitator field short indicators shows as having a short and is able to reset;

   b. Check on a regular basis and report to the emissions control foreman or the maintenance foreman any draft or fan problems;

   c. Check the ESP stack opacity monitor on a regular basis and initiate the following in the event that the stack opacity level, as determined by the opacity monitor, exceeds 30% opacity on a six minute average:

      i. Check the pulpit indicators for proper operation of the steam and spray water system. Report any problems to emission control foreman or maintenance foreman;

      ii. Check the stack gas pulpit set point for proper setting;

      iii. Call the emissions control operator who shall perform the following steps;

         A. Check the AVC operation and power level. Report any problems to electrical maintenance foreman or area electrician;

         B. Check to ensure that doors on all hopper screws are closed;

   d. Check oxygen blow rates and adjust, if necessary;

   e. Check hot metal chemistry;

Permit Application #95010001

ATTACHMENT A (cont.)

f. A log shall be maintained of the above checks and any actions taken as a result.

3. The emission control foreman shall:

   a. Check on a regular basis the opacity monitor exceedances and trends. The control specialist shall be contacted to correct any problems;

   b. Check on a regular basis the draft rate set points;

   c. Check on a regular basis primary and secondary damper settings;

   d. Check on a regular basis ESP operation, including the following:

      i. Fields down;

      ii. Fields indicating shorts and unable to reset;

      iii. Hopper screw doors are closed;

   e. Check on a regular basis blow rates;

   f. Check on a regular basis spray water system operation;

   g. Check on a regular basis steam injection rate;

   h. Contact the area manager regarding electrical maintenance and to schedule the ESP repair work;

   i. Contact the area manger for mechanical maintenance to schedule the isolation of the ESP channel by closing the inlet and outlet gates of that chamber and opening the top hatches for entry into the chamber;

   j. Notify the emissions control operator and melter when isolation work begins;

   k. A log shall be maintained of the above checks and any actions taken as a result.

4. The crane operator shall use the following procedures, as appropriate, to minimize emissions and maximize emissions capture by the hoods:

   a. Use controlled pouring of the hot metal into the BOF vessel;

   b. Use careful positioning of the hot metal ladle with respect to the hood face and furnace mouth;

   c. Use the most beneficial furnace tilt angle;

   d. These procedures shall be posted in the crane operator booth.

Permit Application #95010001

ATTACHMENT C

CONTEMPORANEOUS REDUCTIONS IN THE
EMISSIONS OF PM-10

- Historic roadway emissions of 428 tons/yr, minus future potential roadway emissions of 27 tons/yr, equals a resulting reduction in roadway emissions of 401 tons/yr
- Historic material handling emissions of 17 tons/yr minus future potential material handling emissions of 2 tons/yr, equals a resulting reduction in material handling emissions of 15 tons/yr.
- Emission reductions resulting from the sweeping of city streets = 52 tons/yr*
- Emission reductions resulting from sweeping and housekeeping of areas below and around BOF ESP = 12 tons/yr*

Total reductions in the emissions of PM-10 as a result of the additional dust control measures required by Illinois' SIP and the special conditions of this permit = 480 tons/yr

* These are considered reasonable estimates of reductions and are subject to change upon further investigation of the actual reductions which will occur as a result of the control measures required by this permit.

REVISED
OPERATING PERMIT

PERMITTEE

Granite City Division
of National Steel Corporation
Attn: Joseph S. Kocot
20th and State Street
Granite City, Illinois 62040

Application No.: 95010001
Applicant's Designation:
Subject: Production Increase
Date Issued: January 5, 1999
Location: Southeastern Granite City

I.D. No.: 119813AAI
Date Received: December 22, 1998

Expiration Date: June 6, 2002

Permit is hereby granted to the above-designated Permittee for an increase in the allowable production rate of iron (from 2,372,500 to 3,165,000 net tons per year) and steel (from 2,774,000 to 3,580,000 net tons per year) as described in the above-referenced application. This permit is subject to standard conditions attached hereto and the following special conditions:

1. Prior to issuance of this permit, a draft of this permit has undergone a public notice and comment period, and a public hearing was held.

BLAST FURNACE OPERATIONS

2a. Total combined production of hot metal (a.k.a., iron) from blast furnaces A and B shall not exceed 9,849 net tons per day, averaged over any calendar month, and;

b. Total combined production of hot metal from blast furnaces A and B shall not exceed 3,165,000 net tons per year.

3a. Particulate emissions from the blast furnace casthouse baghouse and iron spout baghouse shall not exceed 0.010 gr/dscf, pursuant to 35 Ill. Adm. Code 212.445(b)(1).

b. The opacity of emissions from the blast furnace casthouse baghouse and the iron spout baghouse shall not exceed 10% on a 6 minute rolling average basis, pursuant to 35 Ill. Adm. Code 212.445(b)(1).

4a. Emissions of particulate matter from any opening in the blast furnace casthouse shall not exceed 20% opacity on a 6-minute rolling average basis beginning from initiation of the opening of the tap hole up to the point where iron and slag stops flowing in the troughs, pursuant to 35 Ill. Adm. Code 212.445(a)(2).

5. Emissions from Blast Furnace operations shall not exceed the limits in attached Tables 1 and 5.

Printed on Recycled Paper

BASIC OXYGEN FURNACE SHOP

6a. Total combined production of liquid steel from the Basic Oxygen Furnaces (BOF's) shall not exceed 11,000 net tons per day, averaged over any calendar month, and;

b. Total combined production of liquid steel from the BOF's shall not exceed 3,580,000 net tons per year.

7. The emissions of PM-10 from the BOF ESP stack for the total of all BOF processes (i.e., operations from the beginning of the charging process through the end of the tapping process) shall not exceed 60.0 lbs/hr and 0.225 lbs per ton of steel in process, pursuant to 35 Ill. Adm. Code 212.458(b)(23).

8. Visible emissions from any opening in the BOF shop (e.g., roof monitor) shall not exceed 20% on a 3 minute rolling average basis.

9a. The Permittee shall determine the opacity from the openings BOF shop on at least a weekly basis. Observations shall be conducted for at least an hour or the entire BOF cycle, whichever is greater.

b. The Permittee shall determine the opacity from the BOF ESP stack for at least one hour on any normal work day (i.e., Monday through Friday) that the continuous opacity monitor on the BOF ESP stack has an outage that exceeds two consecutive hours and is still down. The readings shall commence as soon as possible after the opacity monitor has been down for two consecutive hours. If meteorological conditions or lack of visibility preclude these observations from being conducted, then this shall be noted in the log book.

c. The opacity shall be determined in accordance with the observation procedures set out in 40 CFR Part 60, Appendix A, Method 9 including the requirement that readings be taken by a certified observer.

d. These determinations shall be recorded in a log book, which at a minimum shall include the date and time of observations, name and title of observer, individual opacity readings, calculated opacity so as to determine compliance with Section 212.123, and calculated opacity relative to 20% opacity on a three minute rolling average basis.

10. The Permittee shall follow the BOF operating procedures and requirements specified in attachment A. These requirements are designed to ensure proper operation of the BOF control system. These procedures shall be posted in the BOF pulpit (a.k.a., control room).

11. Flame suppression shall be used and maintained during the entire tapping process.

12a. The stack gas pulpit set point of the BOF ESP control system shall be set in accordance with the following, so as to establish sufficient particulate matter capture efficiency of the charging and primary hoods:

i. Set point requirements while only a single BOF vessel is in operation;

A. Minimum set point during charging process: 550,000 cfm;

B. Minimum set point during refining process: 650,000 cfm;

C. Minimum set point during tapping process: 200,000 cfm (until one minute after completing alloy addition);

b. i. During dual operation of BOF vessels (a.k.a., overlapping BOF operation) the minimum set point shall be 700,000 cfm.

iii. Overlapping operations of the BOF vessels is allowed under the following conditions:

A. The hot metal charge of the second vessel shall be initiated and completed during the time between completion of the blow and start of tap on the first vessel while sufficient draft at the ESP capture system is established and maintained for both vessels.

B. The charge and/or blow on one vessel shall not begin until sufficient draft has been established at the associated ESP capture system (a.k.a., doghouse) and the alloy addition at the vessel tapping has been completed for a least 1 minute.

C. Sufficient draft at the ESP capture system of the vessel being tapped shall be maintained for at least 1 minute after alloy addition has been completed. After such period, the capture system draft may be transferred over to the other vessel in order to satisfy condition (A) above.

D. Only overlapping of the hot metal charge of the second vessel after the end of blow and prior to onset of tap of the first vessel and overlapping of tapping of the first vessel, after alloy addition, and the hot metal charge and/or blow on the second vessel are allowed.

E. Condition B and C above shall be part of the Standard Operating Procedure (SOP) of the BOF vessels.

c. The BOF capture system shall be operated at the above minimum set points until and unless the Agency approves a lower minimum set point based on a demonstration that a better level of particulate matter control will occur, except for purposes of emissions testing as related to the set point.

d. The Permittee shall calibrate, operate, and maintain a continuous strip chart recorder of the ESP stack gas flow rate as measured by the stack gas flow meter during ESP use.

e. The Permittee shall record for each steel production cycle the various stack gas flow rates for each process (i.e., for each charge, each refine, each tap) of each steel production cycle. That is, the Permittee shall be able to distinguish the measured flow rate of stack gas during each production cycle.

f. The stack gas flow meter shall be calibrated on at least a quarterly basis.

13a. The Permittee shall operate and maintain the waste gas suction monitor system that continually measures and records for each process (i.e., for each charge, each refine, each tap) of each steel production cycle the static pressure in the main downcommer duct of the ESP emissions capture and transport system.

b. The waste gas suction monitoring system shall be used as a mechanism to ensure sufficient draft is maintained in the emissions capture hoods and transport ducts so as to maximize emissions capture and transport and minimize uncaptured emissions and emission leaks.

c. The monitoring system shall be operated and maintained to ensure accurate and useful data.

d. The Permittee shall continuously record the static pressure in the main downcommer duct of the ESP emissions capture and transport system.

14a. The Permittee shall visually inspect at least monthly all visible BOF vessel enclosures, hooding and ducts used to capture and transport emissions for the BOF ESP control system.

b. A log shall maintained of these inspections which includes observations of the physical appearance of the capture system and any noted deficiencies (e.g., the presence of any holes in ductwork or hoods, flow constrictions caused by dents or accumulated dust in ductwork, and fan erosion).

c. Any leaks or areas otherwise noted to be in need of repair, shall be repaired as soon as practicable.

15a. The Permittee shall operate, maintain, and repair the BOF ESP in a manner that assures compliance with the conditions of this permit.

b. An adequate inventory of spare parts for the BOF ESP shall be maintained.

16. Written operating procedures for the BOF ESP shall be maintained and updated describing proper normal process and equipment operating parameters, monitoring and instrumentation for measuring control equipment operating parameters, control equipment inspection and maintenance practices, and the availability of spare parts from inventory, local suppliers and other sources.

17. The Permittee shall keep operating records, a maintenance log, and inspection log for the BOF ESP and associated control systems which includes the following:

a. Operating time of the BOF;

b. Operating time of the capture systems and performance parameters, including air flow and fan amperage through the fan motors, gas temperature at inlet to ESP, damper settings, and steam injection rate;

c. Operating time of the ESP and performance parameters, including voltage and amperage of each transformer/rectifier set, number of sections in use;

d. All routine and nonroutine maintenance performed, including dates and duration of outages, inspection schedule and findings, leaks detected, repair actions, and replacements.

18. Emissions from the BOF Shop shall not exceed the limits in attached Tables 2 and 5.

Note: For purposes of this permit, a BOF cycle is defined as the period from the beginning of the charging process through the end of the tapping process. The cycle is comprised of three main processes which are charging, refining, and tapping.

CONTINUOUS CASTING OPERATIONS

19. The continuous casting operations shall comply with 35 Ill. Adm. Code 212.450 and 212.458(b)(8).

20. Emissions from the continuous casting operations shall not exceed the limits in Tables 3 and 5.

FUEL COMBUSTION

21. Total fuel usage for blast furnace stoves (A and B), boiler house boilers (1-10), blast furnace boilers (11 and 12), ladle drying preheaters and blast furnace gas flares shall not exceed the following limits:

a. Natural Gas usage: 225 million ft^3 per month and 1,346 million ft^3 per year;

b. Blast Furnace Gas (BFG) usage: 30,800 million ft^3 per month and 185,030 million ft^3 per year;

c. Fuel Oil usage: 60 thousand gallons per month and 365 thousand gallons per year.

22. Emissions from the fuel combustion units listed above shall not exceed the limits in Tables 4 and 5.

ON-SITE FUGITIVE DUST CONTROL

(Refer to Attachment B for a table which summarizes the required on-site fugitive dust roadway control measures and maps indicating the referred to road segments)

23. The Permittee shall immediately initiate and maintain the on-site fugitive dust control measures specified in this permit so as eliminate dust spillage on in-plant and out-of-plant roadways.

24a. The Permittee shall sweep or flush at least every day the paved access area below the BOF ESP where ESP dust collection bags are used, stored and transported.

b. The Permittee shall implement a housekeeping program for the non-roadway areas below and around the BOF ESP. This program shall, at a minimum, contain the following:

i. The ground and other accessible areas where dust may gather shall be swept or cleaned at least every day;

ii. Cleaning shall be performed in such a manner as to minimize the escape of dust into the atmosphere;

iii. Dust collection bags shall be inspected at least daily for rips, tears, or insecure connection to the discharge chutes of the ESP hoppers;

iv. Dust collection bags shall be inspected after removal from, and connection to, the discharge chutes of the ESP hoppers;

v. Ripped or torn bags shall be taken out of service and transported as soon as practicable in a covered truck.

25. Fugitive emissions of particulate matter from any roadway or parking area shall not exceed an opacity of 5%, pursuant to 35 Ill. Adm. code 212.316(e)(1).

26a. UNPAVED ROADS: On unpaved roads that are part of normal traffic patterns as identified in attachment B (including roads B, C, E, N, F-F, and CS(2)) the Permittee shall apply a chemical dust suppressant at least three times a month, with the following exceptions:

i. Road segment G-G, which shall be sprayed at least quarterly;

ii. Road segments P, V, Z, D-D, E-E, and H, which shall be sprayed at least 4 times per month until paving is completed. Paving shall be completed on these roads no later than July 31, 1996;

iii. Road segment L, which shall be sprayed at least 4 times per month.

b. All other unpaved roads shall be treated as necessary.

c. Applications of suppressant may be less frequent than specified above if weather conditions, i.e., precipitation or temperature, interfere with the schedule for spraying, provided each such instance shall be recorded in accordance with the daily records for on-site fugitive dust control required by this permit.

27a. PAVED ROADWAYS AND AREAS: Paved roadways and areas shall be maintained in good condition.

b. On paved roadways and other areas, the Permittee shall sweep or flush as follows:

i. Road segments D, K, M, F, G, J, R, and O shall be swept or flushed at least daily;

ii. Road segments P, V, W, X, Z, D-D, E-E, and CS(1) shall be swept or flushed at least five days per week;

iii. Road segments S and T shall be swept or flushed at least every other day;

iv. Road segments A and H shall be swept or flushed at least once per month;

v. All gate areas leading from the Steelworks area shall be swept or flushed at least daily;

vi. All gate areas leading from the iron making area shall be swept or flushed at least five times per week.

28. The above on-site dust control measures shall be conducted to maximize their effectiveness by performing said measures when the roads or areas are not normally obstructed by parked vehicles and by preferentially using filter sweeping (e.g., Enviro-Whirl sweeper) for the gate areas, the roads and areas surrounding the BOF and BOF ESP, and other key areas.

29. The Permittee shall maintain daily records relative to the on-site fugitive dust control program which includes the following information as a minimum:

a. The date (and time for the gate areas) each road or area was treated;

b. The manner in which the road or area was treated (i.e., filter sweep, conventional sweep, suppressant spray or flush);

c. Detailed information for use of dust suppressant, including but not limited to the application rate, dilution ratio, type of suppressant used, and the number of gallons of suppressant applied;

d. Observations, if any, concerning the condition of the roadway, e.g., presence of parked vehicles, detection of potholes;

e. The amount of precipitation and temperature recorded for each day, and if determination was made to suspend application of suppressant, include name and title of person who made determination to suspend application and explanation;

f. Any and all suspensions or deviations from the designated control procedures, with date, description, and explanation for suspension of application.

OFF-SITE FUGITIVE DUST CONTROL

30. The Permittee or the Permittee's Agent shall sweep or flush the following Granite City street road areas:

a. At least weekly, the quarter mile segment of Madison Avenue in front of the 16th street gate (i.e., 1/8 of a mile in either direction);

b. At least weekly, segment of 20th street between Lee and Quincy roads;

c. At least monthly, segment of 20th street between Madison and Route 203 (a.k.a. Edwardsville Road).

PM-10 CONTINGENCY MEASURES

31. The Permittee shall comply with the additional control measures (e.g., PM-10 contingency plan) required by 35 Ill Adm. Code Part 212 Subpart U.

COMPLIANCE DETERMINATIONS

32a. Compliance with the daily limits of this permit shall be determined from a monthly total of the relevant daily data divided by the number of days in the month.

b. Compliance with the monthly limits of this permit (e.g., fuel usage) shall be determined by direct comparison of monthly data to the applicable limit.

c. i. Compliance with the annual limits of this permit shall be determined based on a calendar year.

ii. A. Compliance with the production limits in conditions 2(b) and 6(b) shall also be determined on a month by month basis by showing that the actual production of iron and steel from the plant did not exceed the scheduled rate of production for a month given in the most recent production schedule provided to the Agency that shows compliance with the following requirements.

B. If no production schedule is submitted to the Agency by the Permittee for a particular year, the scheduled monthly production of iron and steel shall be set at one twelfth of the annual production limits in conditions 2(b) and 6(b).

C. 1. The Permittee may submit a schedule for iron and steel production for each month of the calendar year. Such schedule shall provide the scheduled monthly iron and steel production for each month and the total of such scheduled production shall not exceed the annual production limits in conditions 2(b) and 6(b). This schedule shall be submitted each year no later than December 15th of the preceding year.

2. During the course of the year, the Permittee may submit a revised production schedule which accounts for actual production levels which were below that scheduled for the previous months, provided that in no case shall the scheduled production for prior months in such a revised schedule be lowered to less than actual production levels or raised. Such revised schedule shall be submitted to the Agency no later than 15 days after the first day of the month for which scheduled production has been raised. Such schedule shall be accompanied by data on actual production in preceding months.

33a. Compliance with opacity limits and measurements of opacity shall be made by opacity readings taken in accordance with the observation procedures set out in 40 CFR Part 60, Appendix A, Method 9.

b. The Permittee shall have at least two employees or agents experienced in making opacity readings to the extent that it is reasonably possible to do so, who shall be able to make the opacity readings required by this permit.

34a. Blast furnace hot metal production shall be measured at the BOF hot metal transfer station, and adjusted by documented slag and iron losses.

b. BOF liquid steel production shall be initially measured by a scale equipped crane and adjusted based upon documented steel production analysis of the continuous casters.

c. BFG usage shall be calculated based on the total BFG produced per net ton hot metal (NTHM) derived by the following formula and adjusted per analysis of documented BFG consumptions:

$$mmft^3\ BFG\ per\ month = \frac{(4.585277\ NTHM/day + 498.191)}{80} \times \begin{pmatrix} Number\ of \\ days\ in \\ that\ month. \end{pmatrix}$$

d. Natural gas usage shall be determined by metered volumes.

e. Fuel oil usage shall be determined by tank height differentials.

RECORD KEEPING

35. The Permittee shall keep records of the following items and such other items which may be appropriate to allow the Agency to review compliance:

a. Blast Furnace hot metal production (total combined daily, monthly and annual in tons), including documentation on iron and slag losses;

b. BOF liquid steel production (total combined daily, monthly and annual in tons), including documentation on adjustments made due to production analysis and losses;

c. Fuel usage as follows; Usage of natural gas and BFG (total combined million ft^3 per month and year, each) and fuel oil (total combined gallons/month and year) for the blast furnace stoves (A and B), boiler house boilers (1-10), blast furnace boilers (11 and 12), ladle drying preheaters and blast furnace gas flares.

36. All records and logs required by this permit shall be retained at a readily accessible location at the source for at least three years from the date of entry and shall be made available for inspection and copying by the Agency and USEPA upon request. Any records retained in a computer shall be capable of being retrieved and

printed on paper during normal source office hours so as to be able to respond to an Agency request for records during the course of a source inspection.

TESTING

37. The special conditions of this permit supplement the special conditions of any existing operating permits for this source, and supersede such conditions in cases where a conflict exists.

38a. The following tests shall be performed by no later than August 6, 1997 to demonstrate compliance with the conditions of this permit.

i. Fuel Combustion Units testing: The emissions of particulate matter from boiler #12 while burning blast furnace gas shall be measured. This test shall be designed to verify compliance with the requirements of this permit and the emission factor used (i.e., 2.9 lbs particulate emitted per mmcf BFG burned);

b. The test shall be performed by an approved independent testing service during conditions which are representative of maximum emissions and at the maximum production rates allowed, or as close to such rates as reasonable if the Permittee demonstrates to the Agency prior to testing that testing at such production rates within the time constraints of an Agency request to test is not practicable.

c. i. The following methods and procedures shall be used for the testing, unless another method is approved by the Agency: Refer to 40 CFR 60, Appendix A for USEPA test methods;

Location of sample points	USEPA Method 1
Gas flow and velocity	USEPA Method 2
Particulate Matter	USEPA Method 5

ii. All particulate measured shall be considered PM-10 unless emissions are tested by an appropriate USEPA test method for measurement of PM-10, as specified in 35 Ill. Adm. Code 212.110(e).

d. At least 30 days prior to the actual date of testing, a written test plan shall be submitted to the Agency for review and approval. This plan shall be describe the specific procedures for testing, including as a minimum:

i. The persons who will be performing sampling and analysis and their experience with similar tests;

ii. The specific conditions under which testing will be performed including a discussion of why these conditions will be representative of maximum emissions and the means by which operating parameters for the source and the emissions capture and control system will be determined;

iii. The specific determinations of emissions and operation which are intended to be made, including sampling and monitoring locations;

iv. The test methods which will be used, with the specific analysis methods;

v. Any proposed use of an alternative test method, with detailed justification;

vii. The format and content of the Source Test Report.

e. The Agency shall be notified before these tests to enable the Agency to observe these tests. Notification for the expected date of testing shall be submitted a minimum of thirty (30) days prior to the expected date. Notification of the actual and expected time of testing shall be submitted a minimum of five (5) working days prior to the actual date of the test. The Agency may at its discretion accept notifications with shorter advance notice provided that the Agency will not accept such notifications if it interferes with the Agency's ability to observe testing.

f. The Final Report of these tests shall include as a minimum:

i. A tabular summary of results which includes:

- process weight rate and/or fuel usage rate
- production rate
- allowable emission limit
- measured emission rate
- determined emission factor
- compliance demonstrated - Yes/No
- any other pertinent information

ii. Description of test methods and procedures used, including description of sampling train, analysis equipment, and test schedule;

iii. Detailed description of test conditions, including,

- pertinent process information (e.g. fuel or raw material consumption)
- control equipment information, i.e. equipment condition and operating parameters during testing;

iv. Data and calculations, including copies of all raw data sheets and records of laboratory analyses, sample calculations, and data on equipment calibration;

g. Copies of the Final Report for these tests shall be submitted to the Agency within 14 days after the test results are compiled and finalized.

h. Submittals of information shall be made as follows:

i. Notice of Test - one copy to Source Emission Test Specialist, one copy to Regional Office, and one copy to Permit Section;

ii. Final Report - one copy to Source Emission Test Specialist, one copy to Regional Office, and one copy to Permit Section.

Pertinent Addresses are:

Springfield, Illinois 62794-9506

REPORTING

39. If there is an exceedance of the requirements of this permit as determined by the records required by this permit, the Permittee shall submit a report to the Agency's Compliance Unit in Springfield, Illinois within 30 days after the exceedance. The report shall include the emissions released in accordance with the record keeping requirements, a copy of the relevant records, and a description of the exceedance or violation, cause of the exceedance, and efforts to reduce emissions and future occurrences. This report shall be sent to:

Illinois EPA
Bureau of Air
Compliance Section (#40)
P.O. Box 19276
Springfield, Illinois 62794-9276

40. The Permittee shall submit the following additional information from the prior calendar year with the Annual Emissions Report, due May 1st of each year:

a. Iron and steel production (tons/month and tons/yr, each);

b. Natural gas and BFG usage ($mmft^3$/month and $mmft^3$/yr, each);

c. Fuel oil usage (thousand gallons/month and thousand gallons/yr, for each type of oil).

APPLICABILITY OF MAJOR SOURCE RULES

41a. As a consequence of the above conditions, this permit is issued based upon the following changes in emissions, as further described in Table 6, accompanying increased production as allowed by this permit:

i. The increases in emissions of lead and VOM are not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration;

ii. The increase in emissions of NO_x are being accompanied by contemporaneous emission decreases provided by the shutdown of equipment and operations such that the net emissions change is not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration.

iii. The increase in emissions of PM and PM-10 are being accompanied by contemporaneous emission decreases provided by additional road dust control and BOF capture and control such that the net emissions change is not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of Significant Deterioration.

Also, the Permittee has agreed to provide further additional dust control consisting of the sweeping of Granite City public streets and housekeeping measures in the area below and surrounding the BOF ESP. Attachment C is a listing of the emission reductions provided by these control measures.

b. The increases in emissions of SO_2 and CO are significant under 40 CFR 52.21 - Prevention of Significant Deterioration (PSD). Accordingly, the project is considered a major modification and must comply with the requirements of PSD. These requirements include a demonstration of best available control requirements for affected SO2 and CO emission units, an analysis of air quality impacts, an analysis of the impacts of the project on visibility, vegetation's and soils, and the application and proposed permit must undergo a public participation. The Agency has determined that these additional requirements have been met.

c. The changes in emissions pertinent to this project are summarized as follows:

Units = tons/year

- Emission increases which could occur from the project:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
51.6	- 52.0	238.8	476.0	5,685	59.3	0.54

- Creditable contemporaneous actual emission decreases:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
58.0	58.0	226.5	0.38	23.31	32.8	0.0

- Other contemporaneous emission increases:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
20.7	20.3	26.0	0.25	11.8	1.6	0.0

- Net emission changes:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
+14.3	-89.2	+38.3	+475.9	+5,673	+28.1	+0.54

- Significant Levels:

PM-10	PM	NO_x	SO_2	CO	VOM	Lead
15	25	40	40	100	40	0.6

d. This revised operating permit issued January 5, 1999 is issued such that the net increase in emissions of PM, PM_{10}, SO_2, NO_x and VOM resulting from increased natural gas combustion are not significant under 35 Ill. Adm. Code Part 203 or 40 CFR 52.21 - Prevention of significant Deterioration. The accounting of the increases in emissions are shown in Tables 7, 8 and 9 of the attachments.

e. The changes in emissions pertinent to the revised operating permit issued January 5, 1999 are summarized as follows:

- Emission increase from increased natural gas combustion:

PM-10	PM	NO_x	SO_2	CO	VOM
3.43	3.43	205.94	0.40	26.92	1.88

- Natural gas combustion baseline emissions (average of 1996 and 1997 actuals):

PM-10	PM	NO_x	SO_2	CO	VOM
2.9	2.9	174.11	0.34	22.76	1.59

- Net emission changes:

PM-10	PM	NO_x	SO_2	CO	VOM
0.53	0.53	31.83	0.06	4.16	0.29

- Significant levels:

PM-10	PM	NO_x	SO_2	CO	VOM
15	25	40	40	100	40

Explanatory Note:

PM	=	particulate matter = particulate;
PM-10	=	particulate matter less than or equal to 10 micrometers in size;
SO_2	=	sulfur dioxide;
NO_x	=	nitrogen oxides;
VOM	=	volatile organic material;
CO	=	carbon monoxide;
mm	=	million;

gr/dscf = grains per dry standard cubic foot;
acfm = actual cubic feet per minute;
mmcf = million cubic feet;
Mgal = thousands of gallons.

Please note that this permit has been revised to incorporate construction permit 98110038.

If you have any questions on this permit, please call Ernie Kierbach at 217/782-2113.

PROCEDURES TO ENSURE PROPER OPERATION
OF BOF ESP CONTROL SYSTEM

1. The emissions control operator shall:

   a. Check on a regular basis and report to the emissions control foreman or melter:

      i. Any ESP fields down;

      ii. Any ESP fields in which the meter readings are showing no current or a fault;

   b. Check on a regular basis that doors on all hopper screws are closed;

   c. Inspect on a regular basis the fans and motors for unusual sounds and/or visual problems. Any abnormalities will be immediately reported to the melter or maintenance foreman for investigation.

2. The melter shall:

   a. Check on a regular basis and report to the emissions control foreman or the area electrician any fields which the pulpit precipitator field short indicators shows as having a short and is able to reset;

   b. Check on a regular basis and report to the emissions control foreman or the maintenance foreman any draft or fan problems;

   c. Check the ESP stack opacity monitor on a regular basis and initiate the following in the event that the stack opacity level, as determined by the opacity monitor, exceeds 30% opacity on a six minute average:

      i. Check the pulpit indicators for proper operation of the steam and spray water system. Report any problems to emission control foreman or maintenance foreman;

      ii. Check the stack gas pulpit set point for proper setting;

      iii. Call the emissions control operator who shall perform the following steps;

         A. Check the AVC operation and power level. Report any problems to electrical maintenance foreman or area electrician;

         B. Check to ensure that doors on all hopper screws are closed;

   d. Check oxygen blow rates and adjust, if necessary;

   e. Check hot metal chemistry;

Permit Application #95010001

ATTACHMENT A (cont.)

f. A log shall be maintained of the above checks and any actions taken as a result.

3. The emission control foreman shall:

a. Check on a regular basis the opacity monitor exceedances and trends. The control specialist shall be contacted to correct any problems;

b. Check on a regular basis the draft rate set points;

c. Check on a regular basis primary and secondary damper settings;

d. Check on a regular basis ESP operation, including the following:

i. Fields down;

ii. Fields indicating shorts and unable to reset;

iii. Hopper screw doors are closed;

e. Check on a regular basis blow rates;

f. Check on a regular basis spray water system operation;

g. Check on a regular basis steam injection rate;

h. Contact the area manager regarding electrical maintenance and to schedule the ESP repair work;

i. Contact the area manger for mechanical maintenance to schedule the isolation of the ESP channel by closing the inlet and outlet gates of that chamber and opening the top hatches for entry into the chamber;

j. Notify the emissions control operator and melter when isolation work begins;

k. A log shall be maintained of the above checks and any actions taken as a result.

4. The crane operator shall use the following procedures, as appropriate, to minimize emissions and maximize emissions capture by the hoods:

a. Use controlled pouring of the hot metal into the BOF vessel;

b. Use careful positioning of the hot metal ladle with respect to the hood face and furnace mouth;

c. Use the most beneficial furnace tilt angle;

d. These procedures shall be posted in the crane operator booth.

ATTACHMENT C

CONTEMPORANEOUS REDUCTIONS IN THE EMISSIONS OF PM-10

- Historic roadway emissions of 428 tons/yr, minus future potential roadway emissions of 27 tons/yr, equals a resulting reduction in roadway emissions of 401 tons/yr
- Historic material handling emissions of 17 tons/yr minus future potential material handling emissions of 2 tons/yr, equals a resulting reduction in material handling emissions of 15 tons/yr.
- Emission reductions resulting from the sweeping of city streets = 52 tons/yr*
- Emission reductions resulting from sweeping and housekeeping of areas below and around BOF ESP = 12 tons/yr*

Total reductions in the emissions of PM-10 as a result of the additional dust control measures required by Illinois' SIP and the special conditions of this permit = 480 tons/yr

* These are considered reasonable estimates of reductions and are subject to change upon further investigation of the actual reductions which will occur as a result of the control measures required by this permit.

STATE OF ILLINOIS
ENVIRONMENTAL PROTECTION AGENCY
DIVISION OF AIR POLLUTION CONTROL
2200 CHURCHILL ROAD
SPRINGFIELD, ILLINOIS 62706

STANDARD CONDITIONS FOR OPERATING PERMITS

July 1, 1985

The Illinois Environmental Protection Act (Illinois Revised Statutes, Chapter 111-1/2, Section 1039) grants the Environmental Protection Agency authority to impose conditions on permits which it issues.

The following conditions are applicable unless superseded by special permit condition(s).

1. The issuance of this permit does not release the permittee from compliance with state and federal regulations which are part of the Illinois State Implementation Plan, as well as with other applicable statutes and regulations of the United States or the State of Illinois or with applicable local laws, ordinances and regulations.

2. The Agency has issued this permit based upon the information submitted by the permittee in the permit application. Any misinformation, false statement or mispresentation in the application shall be grounds for revocation under 35 Ill. Adm. Code 201.207.

3. a. The permittee shall not authorize, cause, direct or allow any modification, as defined in 35 Ill. Adm. Code 201.102, of equipment, operations or practices which are reflected in the permit application as submitted unless a new application or request for revision of the existing permit is filed with the Agency and unless a new permit or revision of the existing permit(s) is issued for such modification.

   b. This permit only covers emission sources and control equipment while physically present at the indicated plant location(s). Unless the permit specifically provides for equipment relocation, this permit is void for an item of equipment on the day it is removed from the permitted location(s) or if all equipment is removed, notwithstanding the expiration date specified on the permit.

4. The permittee shall allow any duly authorized agent of the Agency, upon the presentation of credentials, at reasonable times:

   a. to enter the permittee's property where actual or potential effluent, emission or noise sources are located or where any activity is to be conducted pursuant to this permit,

   b. to have access to and to copy any records required to be kept under the terms and conditions of this permit,

   c. to inspect, including during any hours of operation of equipment constructed or operated under this permit, such equipment and any equipment required to be kept, used, operated, calibrated and maintained under this permit,

   d. to obtain and remove samples of any discharge or emission of pollutants, and

   e. to enter and utilize any photographic, recording, testing, monitoring or other equipment for the purpose of preserving, testing, monitoring or recording any activity, discharge or emission authorized by this permit.

5. The issuance of this permit:

   a. shall not be considered as in any manner affecting the title of the premises upon which the permitted facilities are located,

   b. does not release the permittee from any liability for damage to person or property caused by or resulting from the construction, maintenance, or operation of the facilities,

c. does not take into consideration or attest to the structural stability of any unit or part of the project, and

d. in no manner implies or suggests that the Agency (or its officers, agents or employees) assumes any liability, directly or indirectly, for any loss due to damage, installation, maintenance, or operation of the proposed equipment or facility.

6. The facilities covered by this permit shall be operated in such a manner that the disposal of air contaminants collected by the equipment shall not cause a violation of the Environmental Protection Act or regulations promulgated thereunder.

7. The permittee shall maintain all equipment covered under this permit in such a manner that the performance of such equipment shall not cause a violation of the Environmental Protection Act or regulations promulgated thereunder.

8. The permittee shall maintain a maintenance record on the premises for each item of air pollution control equipment. This record shall be made available to any agent of the Environmental Protection Agency at any time during normal working hours and/or operating hours. As a minimum, this record shall show the dates of performance and nature of preventative maintenance activities.

9. No person shall cause or allow continued operation during malfunction, breakdown or startup of any emission source or related air pollution control equipment if such operation would cause a violation of an applicable emission standard or permit limitation. Should a malfunction, breakdown or startup occur which results in emissions in excess of any applicable standard or permit limitation, the permittee shall:

   a. immediately report the incident to the Agency's Regional Field Operations Section Office by telephone, telegraph, or other method as constitutes the fastest available alternative, and shall comply with all reasonable directives of the Agency with respect to the incident;

   b. maintain the following records for a period of no less than two (2) years:

      i. date and duration of malfunction, breakdown or startup,

      ii. full and detailed explanation of the cause,

      iii. contaminants emitted and an estimate of quantity of emissions,

      iv. measures taken to minimize the amount of emissions during the malfunction, breakdown or startup, and

      v. measures taken to reduce future occurrences and frequency of incidents.

10. If the permit application contains a compliance program and project completion schedule, the permittee shall submit a project completion status report within thirty (30) days of any date specified in the compliance program and project completion schedule or at six month intervals, whichever is more frequent.

11. The Permittee shall submit an Annual Emission Report as required by 35 Ill. Adm. Code. 201.302 and 35 Ill. Adm. code Part 254.

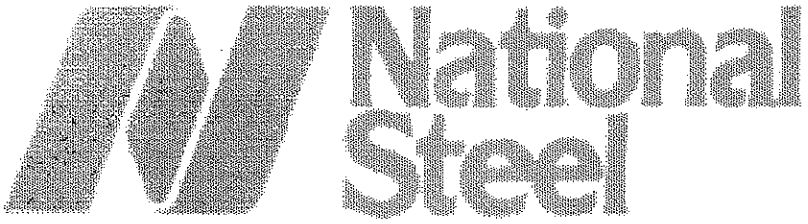
PROPOSED PRODUCTION INCREASE
GRANITE CITY DIVISION of
NATIONAL STEEL CORPORATION
GRANITE CITY, ILLINOIS



Prepared for
Granite City Division of
National Steel Corporation

For Submittal to
Illinois Environmental Protection Agency

Prepared by
Woodward-Clyde Consultants
2318 Millpark Drive
St. Louis, Missouri

December, 1994
Amended October, 1995

Permit Application Update
APPLICATION # 95010001
Proposed Production Increase
Granite City Division of National Steel

The December, 1994 Permit Application for a proposed production increase at the Granite City Division of National Steel contains information concerning emissions changes that are contemporaneous with the proposed increase in production. One of the contemporaneous changes listed is the installation of a new galvanizing line (#8 Galvanizing Line).

The information contained in the permit application was based on design information as it was available at the time of application preparation. Since that time as-built information has become available. The original design envisioned six 0.64 mmBtu/hr space heaters. The final installation included five 3.44 mmBtu/hr space heaters. This change resulted in small changes in the estimated emissions associated with the project.

The attached replacement pages for the production increase application reflect emissions estimated based on the installed equipment. These pages also reflect a correction to the TSP emission factor used to calculate blast furnace uncaptured fugitive emissions. The corrected emission factor changes the projected actual emissions associated with this unit from 24.53 to 49.06 tons per year.

The changes in estimated emissions contained in this update do not result in any changes to the conclusions drawn from the analysis. There are no changes in pollutants that have significant net increases in emissions.

The attached package includes the following.

New Section or Table	Replaces Section or Table
Pages 3-7 through 3-14 (January 16, 1996)	Pages 3-7 through 3-14 (October 30, 1995)

1.1 PROJECT OVERVIEW

The Granite City Division of National Steel Corporation is proposing to increase production at it's steel mill in Granite City, Illinois. This application is proposed to permit an increase in the production rate of the existing Blast Furnaces, Basic Oxygen Furnaces, and Continuous Casters. Operation of the furnaces is for 24 hours per day, 365 days per year.

The Granite City Steel mill is located in Madison County, Illinois. The largest city near the facility is St. Louis, which is located approximately 15 kilometers southwest of the Granite City steel mill. The latitude and longitude of the mill are approximately 38:41:55 and 90:08:42. The facility occupies approximately 1,100 acres of land in an area primarily used for industrial and agricultural purposes. A site location map is provided in **Figure 1-1**. A site map is provided in **Figure 1-2**. There are no listed federal Prevention of Significant Deterioration (PSD) Class I areas located within 100 km of the project site.

1.2 RECENT PERMITTING HISTORY

Granite City Steel obtained a permit from Illinois EPA in January 1994 to increase the production rate of Blast Furnaces to 6,500 net tons per day and Basic Oxygen Furnaces to 7,600 net tons per day. The permitted production rate for the continuous caster remained at 6,900 net tons per day (permit #119813AAI dated January 4, 1994).

1.3 APPLICATION INFORMATION

The applicant for this project is as follows:

Granite City Division of
National Steel Corporation
20th and State Streets
Granite City, Illinois 62040

The applicant contact is Mr. Larry Siebenberger. Mr. Siebenberger may be contacted at (618) 451-3391.

The Granite City Division of National Steel Corporation proposes to increase production from their two blast furnaces, two basic oxygen furnaces, and two continuous casters.

The production increases proposed in this application are as follows:

- Increase the blast furnaces' production from 6,500 net tons per day (NTPD) to 8,671 NTPD on a calander year average and 9,849 NTPD on a maximum monthly average
- Increase the Basic Oxygen Furnaces' production from 7,600 NTPD to 9,808 NTPD on a calander year average and 11,000 NTPD on a maximum monthly average
- Increase the continuous casters' production from 6,900 NTPD to 9,808 NTPD on a calander year average and 11,000 NTPD on a maximum monthly average

Based on an analysis to determine the net emissions changes resulting from the proposed project, the production increase would result in a net increase in emissions of sulfur dioxide (SO_2), particulate matter less than 10 microns in diameter (PM_{10}), total suspended particulate matter (TSP), carbon monoxide (CO), nitrogen oxides (NO_x), volatile organic material (VOM), and lead (Pb). However, with the exception of CO and SO_2 emissions, the increase would not be significant when measured against state and federal air quality regulations. Therefore the netting analysis presented in Section 3 addresses all pollutants and the balance of this application addresses CO and SO2 only.

The Granite City facility is located in an area that is designated as attainment for SO_2, CO, and Pb and nonattainment for ozone (including NO_x and VOM) and particulate matter (including TSP and PM_{10}). The net emission increases for SO_2 and CO are in excess of the applicable Prevention of Significant Deterioration (PSD) significance levels of 40 and 100 tons per year, respectively. Therefore, the proposed increase in production is considered a major modification

requiring a Best Available Control Technology (BACT) analysis. The net emission increases for Pb and the nonattainment pollutants are all below the PSD and new source review (NSR) significance levels. Therefore no additional control technology analyses for these pollutants are necessary.

Related to the production increase, the amount of fuel used by the boilers at the mill may also increase. However, the increase in fuel use by the boilers will not bring total fuel use to an amount greater than allowed by Granite City Steel's existing permits. Also, the fuels types used by the boilers will not change. Therefore, the boilers are not considered part of the major modification and are exempt from BACT review as specified in the federal regulations at 40 CFR 52.21(b)(2)(iii). Increases in emissions due to increased fuel use will, however, be included in the air quality modeling analysis for this application.

It should also be noted that the actual increase in the use of blast furnace gas can only be estimated at this time. This is because actual operation of the blast furnaces at the proposed production level is needed to determine the actual increase in the blast furnace gas generated. Granite City Steel has estimated the increase in blast furnace gas for this application and is confident that the total emissions associated with this fuel for the production increase will be no greater than that represented in this application. Depending on the actual fuel mix and steam demand that accompanies the production increase, Granite City Steel may consider replacement of some existing boilers or modifications to existing boilers to more efficiently use blast furnace gas which would otherwise be flared. These boiler changes would not adversely affect the total emissions associated with the fuel mix. Such changes, if they appear prudent, will be discussed with IEPA prior to implementation.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

2.0
PROCESS DESCRIPTION

2.1 GENERAL DESCRIPTION OF THE MILL

The Granite City Division of National Steel Corporation owns and operates an integrated steel mill in Granite City, Illinois. Integrated steel manufacturing involves raw material preparation, iron production, iron preparation, and steel production.

2.2 GENERAL PROCESS DESCRIPTION

In this mill, iron is produced in blast furnaces by reducing iron bearing material with a hot gas. The charge, consisting of iron ore, coke, limestone, and other materials, is heated to a temperature above 900°C in the blast furnace. Air heated from 870°C to 1100°C is blown through tuyeres into bottom of the furnace. Oxygen in the air reacts with coke, forming carbon monoxide, which in turn reduces the iron oxides in the ore to iron. Limestone and other fluxs in the charge combine with the sulfur in the charge to form sulfates, which float to the top of the mix and are removed in the slag. A trace amount of sulfur is present in the blast furnace gas as it exits due to the reactions and oxidation taking place in the furnace. Molten iron and slag, accumulated in the hearth of the furnace, are drained into a trough equipped with a skimmer and a dam, resulting in the separation of molten iron from the slag.

The molten iron is further desulfurized by injecting a desulfurization reagent through a lance into the hot metal in the hot metal ladle using a carrier gas. This process is conducted in a desulfurization station located inside the BOF shop. The constituents of this reagent are typically CaC_2 which desulfurizes the molten metal, and $CaCO_3$ which provides the CO_2 gas required to mix the metal with the desulfurization agent. This treatment can reduce the sulfur content of the metal to less than 0.005%. Sulfur in the molten metal reacts to form calcium sulfate compounds, which are skimmed off the molten metal as slag. A collection hood collects emissions from the desulfurization process.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

The basic oxygen furnace receives a charge composed of approximately 30% metal scrap and 70% molten iron. High purity oxygen is injected below the surface of the molten metal converting it into molten steel. Limestone is added to the charge to form a slag to capture the oxidation products.

Figure 2-1 shows the process flow for the Basic Oxygen Furnace Shop, **Figure 2-2** shows the process flow for ladle metallurgy and argon stirring stations, and **Figure 2-3** shows the process flow for the Continuous Casters.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

3.1 EXISTING AND PROPOSED EMISSION RATES

Emission rates used for calculation of pollutant emissions from the Blast Furnace, BOF and Continuous Casters are based on published emission factors, regulatory limits, and emission test results. Appendix A provides information on stack tests used in this application. The factors used for lead emssions are based on laboratory analysis of the dust taken from control equipment. Laboratory information is included in Appendix B. Certain of the process sources (e.g. Hot Metal Relading, Transfer Pits, and the Desulfurization Station) are grouped since the emissions are ducted to a common control device. Selected process related emission factors are summarized in the following table.

PROCESS RELATED EMISSION FACTORS

Process Unit	Pollutant	Emission Factor	Reference
BOF Precipitator Stack	PM	0.160 lb/ton	Average (March 1989 Stack Test July 1990 Stack Test August 1993 Stack Test)
	NO_x	0.0389 lb/ton	August 1993 Stack Test
	CO	8.993 lb/ton	August 1993 Stack Test
BOF Roof Monitor (Base Period)	PM	0.4282 lb/ton PM 0.2869 lb/ton PM_{10}	Based on calculations included in Appendix C
BOF Roof Monitor (Projected Period)	PM	0.09872 lb/ton 0.06614 lb/ton	Based on calculations included in Appendix C
Blast Furnance Iron Spout Baghouse	SO_2	0.0073 lb/ton	July, 1993 Stack Test
Blast Furnace Casthouse	PM	0.0703 lb/ton	based on New Source Performance Standards (40CFR60.142a)
	SO_2	0.2006 lb/ton	July, 1993 Stack Test
Blast Furnace Casthouse	NO_x	0.0144 lb/ton	July, 1993 Stack Test
	VOM	0.1016 lb/ton	July, 1993 Stack Test

Fuel combustion emission increases related to the proposed production increase were based on use of the emission factors listed on the following table. The factors for oil are based on

residual oil since the boilers have multiple fuel capability and residual oil factors result in the highest emissions.

FUEL RELATED EMISSION FACTORS

FUEL and FACTOR UNITS	POLLUTANT	EMSSION FACTOR	REFERENCE
Natural Gas (lb/MMcf)	CO	40	AP-42, Page 1.4-2

3.2 REGULATORY ANALYSIS

The proposed modification at the Granite City mill will be subject to both state and federal requirements. Illinois has promulgated air pollution control requirements which apply to both existing and new facilities. The source is subject to the requirements of the Prevention of Significant Deterioration (PSD) regulations. Madison County, where the facility is located is designated moderate nonattainment for ozone and attainment for all other criteria pollutants.

On June 19, 1978, the USEPA promulgated regulations governing Prevention of Significant Deterioration of air quality to implement provisions of the Clean Air Act Amendments of 1977. These regulations were changed as a result of the December 14, 1979 decision of the U.S. Court of Appeals for the District of Columbia (Alabama Power Company, et al. vs. Costle). Final rules pursuant to this decision were promulgated on August 7, 1980.

The PSD regulations apply to major sources - i.e., any of the 28 source categories listed in the regulations which emit, or have the potential to emit, more than 100 tons per year of any pollutant subject to regulation under the Clean Air Act, or any other source category which has the potential to emit more than 250 tons per year of any pollutant subject to regulation under the Act. The PSD regulation also applies to the proposed modification of an existing major source, if the emission increase exceeds the significant emission rates defined in the regulations. The proposed production increase will result in an emission increase greater than the PSD significant level of 100 and 40 tons per year for CO and SO_2 respectively. Thus, the proposed modification will be subject to the PSD regulations for CO and SO_2.

3.3 NETTING ANALYSIS

The Granite City Division of National Steel Corporation intends to increase production at their Blast Furnaces, Basic Oxygen Furnaces, and Continuous Casters. The proposed production level is set out in the following table.

PRODUCTION AREA	PROPOSED PRODUCTION
BLAST FURNACE	8,671 NTPD
BOF SHOP	9,808 NTPD
CASTERS	9,808 NTPD (liquid steel to the casters)

There will be changes in regulated air pollutants accompanying this increase in production. Production related emission increases and contemporaneous emission changes were calculated in accordance with Illinois Environmental Protection Agency (IEPA) regulations for Construction and Modification of Major Stationary Sources (Part 203).

A baseline period for this analysis was chosen to be the period August 1992 through July 1994. Emission changes (related to the production increase and contemporaneous changes) were calculated for:

- Carbon Monoxide (CO)
- Nitrogen Oxides (NO_X)
- Sulfur Dioxide (SO_2)
- Particulate Matter less than 10 Microns (PM_{10})
- Particulate Matter (TSP)
- Volatile Organic Material (VOM)
- Lead (Pb)

The following conclusions were reached regarding the magnitude of the net emission changes related to the production increase and contemporaneous emissions changes:

POLLUTANT	NET EMISSION CHANGE
Carbon Monoxide	Significant
Nitrogen Oxides	Not Significant
Sulfur Dioxide	Significant
Total Suspended Particulate Matter	Not Significant

POLLUTANT	NET EMISSION CHANGE
Particulate Matter less than 10 Microns	Not Significant
Volatile Organic Material	Not Significant
Lead	Not Significant

On the basis of these results, only carbon monoxide (CO) and sulfur dioxide (SO_2) will be considered further in the New Source Review process. Information contained in this section concerning the net emission changes for the significant pollutants are presented for information only since these pollutants will be considered in the review process.

3.3.1 BASE PERIOD SELECTION AND NETTING PROCEDURE

The first step in the air quality permitting process is a "netting" evaluation. This evaluation is used to determine whether an air quality permit and subsequent New Source Review is needed. The analysis considers the increase in emissions that will accompany the proposed project. The increase is measured against a base period which is typically taken as the actual annual emissions averaged over the 24 most recent months. Other base periods can be established if they can be shown to be more representative of normal source operations.

The base period used for this analysis is August 1, 1992 through July 31, 1994. This period was selected because it represents the most recent available 24 month period consistent with IEPA Regulation 203.104. While this period has been used for this analysis, it should be noted that there was significant downtime related to furnace repairs in 1992 which has the effect of depressing base period production.

Changes in emissions expected as a result of the proposed increase in production were in most cases scaled from the base period average actual annual emission rate based on fuel usage and production rates consistent with the proposed production increase. A factor was developed by dividing the proposed production levels by the base period production levels as shown in the following table.

PRODUCTION AREA	AUGUST 1992 - JULY 1994 PRODUCTION	PROPOSED PRODUCTION	RATIO
BLAST FURNACE	5,643	8,671 NTPD	1.537
BOF SHOP	6,612	9,808 NTPD	1.483
CASTERS	6,612	9,808 NTPD (steel to casters)	1.483

9808 / 6612 = 1.483

Appendix D contains additional information on the base period production. **Figure 3-1** shows production trends for the mill.

In certain instances where there is an allowable emission limitation, that limitation was used as the basis of calculating the potential emissions levels associated with the proposed production limit increases. The netting analysis also considers contemporaneous emission changes, both increases and decreases. Contemporaneous changes are defined as changes that have occurred over the past five years.

The analysis is carried out individually for each pollutant that will be effected by the proposed change in source operations. In this case, emissions of Sulfur Dioxide (SO_2), Particulate Matter (TSP and PM_{10}), Nitrogen Oxides (NO_X), Volatile Organic Material (VOM), Lead (Pb), and Carbon Monoxide (CO) were evaluated.

For each pollutant for which the source is major, the net emission change is compared against significance levels specified in new source review guidelines. If the net changes in emissions that result from the planned project plus contemporaneous changes for any single pollutant exceed the applicable significance level, the project is treated as a major modification of the source. The significance levels applicable for this project are:

POLLUTANT	SIGNIFICANCE LEVEL (tons per year)
Carbon Monoxide	100
Nitrogen Oxides	40
Sulfur Dioxide	40

POLLUTANT	SIGNIFICANCE LEVEL (tons per year)
Total Suspended Particulate	25
Particulate Matter < 10 microns	15
Volatile Organic Material	40
Lead	0.6

The procedures, assumptions, and results are discussed for each pollutant discussed below.

3.3.2 POLLUTANT ANALYSES

3.3.2.1 CARBON MONOXIDE

CO emission sources that would be affected by the proposed production increase include :

- Blast Furnace Stoves
- Continuous Casters
- Boilers 1-12
- Blast Furnace Gas Flare
- BOF Vessels
- Ladle Dryer & Preheater

Table 3-1 presents the estimated increases in CO emissions associated with the production increase. The total increase in CO emissions is 5,685 tons per year. There have been three projects within the five year contemporaneous time frame which resulted in changes to CO emissions. Appendix E presents information on the emission changing projects. Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1991	-22.1
Shutdown of Batch Annealing	December 1991	-1.2
Installation of #8 Galvanizing Line	Expected 1996	+11.8

POLLUTANT	SIGNIFICANCE LEVEL (tons per year)
Total Suspended Particulate	25
Particulate Matter < 10 microns	15
Volatile Organic Material	40
Lead	0.6

The procedures, assumptions, and results are discussed for each pollutant discussed below.

3.3.2 POLLUTANT ANALYSES

3.3.2.1 CARBON MONOXIDE

CO emission sources that would be affected by the proposed production increase include :

- Blast Furnace Stoves
- Continuous Casters
- Boilers 1-12
- Blast Furnace Gas Flare
- BOF Vessels
- Ladle Dryer & Preheater

Table 3-1 presents the estimated increases in CO emissions associated with the production increase. The total increase in CO emissions is 5,685 tons per year. There have been three projects within the five year contemporaneous time frame which resulted in changes to CO emissions. Appendix E presents information on the emission changing projects. Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1991	-22.1
Shutdown of Batch Annealing	December 1991	-1.2
Installation of #8 Galvanizing Line	Expected 1996	+10.2

PROJECT	DATE	EMISSION CHANGE (tpy)
Net Contemporaneous Change		**-11.5**
Proposed Production Increase	To Be Determined	+5,684.8
Net Emission Change		**+5,673.3**

On the basis of these calculations, the proposed production increase would result in a net CO emission increase in excess of the significance level (100 tpy). Thus the production increase would be classified as a major modification and Prevention of Significant Deterioration review requirements would apply for this pollutant.

3.3.2.2NITROGEN OXIDES

Nitrogen Oxides emission sources that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Continuous Casters
- Boilers 1-12
- Blast Furnace Gas Flare
- BOF Vessels
- Ladle Dryer & Preheater
- Caster Molds
- Blast Furnace Casthouse

Table 3-2 presents the estimated increases in NO_X emissions associated with the production increase. The total increase in NO_X emissions is estimated to be 239 tons per year. There have been three projects within the five year contemporaneous time frame which resulted in changes to NO_X emissions. Appendix E presents information on the emission changing projects. Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Net Contemporaneous Change		**-13.1**
Proposed Production Increase	To Be Determined	+5,684.8
Net Emission Change		**+5,671.7**

On the basis of these calculations, the proposed production increase would result in a net CO emission increase in excess of the significance level (100 tpy). Thus the production increase would be classified as a major modification and Prevention of Significant Deterioration review requirements would apply for this pollutant.

3.3.2.2NITROGEN OXIDES

Nitrogen Oxides emission sources that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Continuous Casters
- Boilers 1-12
- Blast Furnace Gas Flare
- BOF Vessels
- Ladle Dryer & Preheater
- Caster Molds
- Blast Furnace Casthouse

Table 3-2 presents the estimated increases in NO_X emissions associated with the production increase. The total increase in NO_X emissions is estimated to be 239 tons per year. There have been three projects within the five year contemporaneous time frame which resulted in changes to NO_X emissions. Appendix E presents information on the emission changing projects. Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1991	-217.8
Shutdown of Batch Annealing	December 1991	-8.7
Installation of #8 Galvanizing Line	Expected 1996	+26.0
Net Contemporaneous Change		**-200.5**
Proposed Production Increase	To Be Determined	+238.8
Net Emission Change		**+38.3**

On the basis of these calculations, the proposed production increase would result in a net NO_X emission change below the significance level (40 tpy). Thus the production increase would not require Prevention of Significant Deterioration (for NO_2) or Nonattainment New Source Review (for O_3 based on NO_x emission levels).

3.3.2.3 SULFUR DIOXIDE

SO_2 emission sources that would be affected by the proposed production increase include :

- Blast Furnace Stoves
- Continuous Casters
- Boilers 1-12
- Blast Furnace Gas Flare
- BOF Vessels
- Ladle Dryer & Preheater
- Blast Furnace Casthouse

Table 3-3 presents the estimated increases in SO_2 emissions associated with the production increase. The expected increase in SO_2 emissions is 476 tons per year. Based on information provided by Granite City Steel, there have been three projects within the five year contemporaneous time frame which resulted in changes to SO_2 emissions. Appendix E presents information on the emission changing projects. Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1991	-217.8
Shutdown of Batch Annealing	December 1991	-8.7
Installation of #8 Galvanizing Line	Expected 1996	+18.4
Net Contemporaneous Change		**-208.1**
Proposed Production Increase	To Be Determined	+238.8
Net Emission Change		**+30.7**

On the basis of these calculations, the proposed production increase would result in a net NO_X emission change below the significance level (40 tpy). Thus the production increase would not require Prevention of Significant Deterioration (for NO_2) or Nonattainment New Source Review (for O_3 based on NO_x emission levels).

3.3.2.3 SULFUR DIOXIDE

SO_2 emission sources that would be affected by the proposed production increase include :

- Blast Furnace Stoves
- Continuous Casters
- Boilers 1-12
- Blast Furnace Gas Flare
- BOF Vessels
- Ladle Dryer & Preheater
- Blast Furnace Casthouse

Table 3-3 presents the estimated increases in SO_2 emissions associated with the production increase. The expected increase in SO_2 emissions is 476 tons per year. Based on information provided by Granite City Steel, there have been three projects within the five year contemporaneous time frame which resulted in changes to SO_2 emissions. Appendix E presents information on the emission changing projects. Projects considered in calculating the net emission change are listed in the table below.

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1991	-0.34
Shutdown of Batch Annealing	December 1991	-0.04
Installation of #8 Galvanizing Line	Expected 1996	+0.25
Net Contemporaneous Change		**-0.13**
Proposed Production Increase	To Be Determined	+475.98
Net Emissions Change		**+475.85**

On the basis of these calculations, the proposed production increase would result in a net SO_2 emission increase in excess of the significance level. Thus the production increase would be classified as a major modification and Prevention of Significant Deterioration requirements would apply for this pollutant.

3.3.2.4PARTICULATE MATTER

Particulate Matter (PM_{10} and TSP) emission sources that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Boilers 1-12
- Blast Furnace Gas Flare
- BOF Vessels
- Continuous Casters
- Ladle Dryer & Preheater
- Blast Furnace Process Emission Points
- BOF Shop Process Emission Points
- Continuous Caster Process Emission Points
- Fugitive Emissions from Roads and Materials Handling

Particulate matter emission increases are affected by the types and amounts of fuel used in each process unit that will be affected by the production increase. Appendix F presents information

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1991	-0.34
Shutdown of Batch Annealing	December 1991	-0.04
Installation of #8 Galvanizing Line	Expected 1996	+0.20
Net Contemporaneous Change		**-0.18**
Proposed Production Increase	To Be Determined	+475.98
Net Emissions Change		**+475.80**

On the basis of these calculations, the proposed production increase would result in a net SO_2 emission increase in excess of the significance level. Thus the production increase would be classified as a major modification and Prevention of Significant Deterioration requirements would apply for this pollutant.

3.3.2.4 PARTICULATE MATTER

Particulate Matter (PM_{10} and TSP) emission sources that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Boilers 1-12
- Blast Furnace Gas Flare
- BOF Vessels
- Continuous Casters
- Ladle Dryer & Preheater
- Blast Furnace Process Emission Points
- BOF Shop Process Emission Points
- Continuous Caster Process Emission Points
- Fugitive Emissions from Roads and Materials Handling

Particulate matter emission increases are affected by the types and amounts of fuel used in each process unit that will be affected by the production increase. Appendix F presents information

PROJECT	DATE	EMISSION CHANGE (tpy)
Shutdown of Blooming Mill	April 1991	-0.34
Shutdown of Batch Annealing	December 1991	-0.04
Installation of #8 Galvanizing Line	Expected 1996	+0.20
Net Contemporaneous Change		**-0.18**
Proposed Production Increase	To Be Determined	+475.8
Net Emissions Change		475.8 **+470.28**

On the basis of these calculations, the proposed production increase would result in a net SO_2 emission increase in excess of the significance level. Thus the production increase would be classified as a major modification and Prevention of Significant Deterioration requirements would apply for this pollutant.

3.3.2.4 PARTICULATE MATTER

Particulate Matter (PM_{10} and TSP) emission sources that would be affected by the proposed production increase include the following:

- Blast Furnace Stoves
- Boilers 1-12
- Blast Furnace Gas Flare
- BOF Vessels
- Continuous Casters
- Ladle Dryer & Preheater
- Blast Furnace Process Emission Points
- BOF Shop Process Emission Points
- Continuous Caster Process Emission Points
- Fugitive Emissions from Roads and Materials Handling

Particulate matter emission increases are affected by the types and amounts of fuel used in each process unit that will be affected by the production increase. Appendix F presents information

regarding fugitive emissions changes from roads and materials handling areas. **Figures 3-2, 3-3,** and **3-4** show the road network used in this analysis.

The baseline information used is from a 1988 fugitive emission inventory performed by MRI for the USEPA. Based on that information the emissions were adjusted to reflect the effect of the PM10 control program incorporated into Illinois' SIP to represent base case conditions. The emissions were then scaled up on each road that would be effected by the production increase. In addition, the emissions estimates were adjusted to reflect new controls that are integral to this application.

The specific fugitive dust control program that will be in place concurrent with production increase is described in Appendix F.

Table 3-4 and **Table 3-5** present the estimated changes in PM_{10} and TSP emissions associated with the production increase. The total change in PM_{10} and TSP emissions is 52 tons per year and -52 tons per year respectively. *(With the exception of the emission factor for the BOF Roof Monitor and the Blast Furnace uncaptured fugitives, the PM_{10} emissions have been estimated using a factor identical to the PM factor. This procedure may result in an overestimate of actual PM_{10} emissions).*

The change in PM emissions reflected in **Tables 3-4** and **3-5** reflect significant improvements in the capture and control system for the BOF stack. These improvements, which have not been accounted for in any previous permit, result in emissions reductions of 228 and 340 tons per year PM_{10} and TSP respectively including consideration of the proposed production increase. Additional information regarding this emissions change can be found in Appendix C.

There have been six projects (in addition to control of fugitive emissions from roads) within the five year contemporaneous time frame which resulted in changes to PM_{10} emissions. Appendix E presents information on the emission changing projects.

Projects considered in calculating the net PM_{10} and TSP emission change and the associated total estimated emissions change are listed in the table below.

regarding fugitive emissions changes from roads and materials handling areas. **Figures 3-2, 3-3,** and **3-4** show the road network used in this analysis.

The baseline information used is from a 1988 fugitive emission inventory performed by MRI for the USEPA. Based on that information the emissions were adjusted to reflect the effect of the PM10 control program incorporated into Illinois' SIP to represent base case conditions. The emissions were then scaled up on each road that would be effected by the production increase. The specific fugitive dust control program that will be in place concurrent with production increase is described in Appendix F.

Table 3-4 and **Table 3-5** present the estimated changes in PM_{10} and TSP emissions associated with the production increases and fugitive dust controls to roads. The total change in PM_{10} and TSP emissions is 52 tons per year and -61 tons per year respectively. *(With the exception of the emission factor for the BOF Roof Monitor, the PM_{10} emissions have been estimated using a factor identical to the PM factor. This procedure may result in an overestimate of actual PM_{10} emissions).*

The change in PM emissions reflected in **Tables 3-4** and **3-5** reflect significant improvements in the capture and control system for the BOF stack. These improvements, which have not been accounted for in any previous permit, result in emissions reductions of 228 and 340 tons per year PM_{10} and TSP respectively including consideration of the proposed production increase. Additional information regarding this emissions change can be found in Appendix C.

There have been six projects (in addition to control of fugitive emissions from roads) within the five year contemporaneous time frame which resulted in changes to PM_{10} emissions. Appendix E presents information on the emission changing projects.

Projects considered in calculating the net PM_{10} and TSP emission change and the associated total estimated emissions change are listed in the table below.

ESTIMATED CHANGE IN PM10 EMISSIONS

PROJECT	DATE	PM_{10} EMISSION CHANGE (tpy)
Remove Blast Furnace Slag Spout Hood	January 1990	+4.9
# 2 Caster Production	December 1990	+11.7
Ingot Teeming Shutdown	April 1991	-22.4
Shutdown of Blooming Mill	April 1991	-3.4
Shutdown of Batch Annealing	December 1991	-0.2
Road and Material Handling Fugitive Dust Controls	November, 1991 to Present	-32.0
Installation of #8 Galvanizing Line	Expected 1996	+4.1
Net Contemporaneous Change		**-37.3**
Proposed Production Increase	To Be Determined	+51.6
Net Emissions Change		**+14.3**

ESTIMATED CHANGE IN TSP EMISSIONS

PROJECT	DATE	PM_{10} EMISSION CHANGE (tpy)
Remove Blast Furnace Slag Spout Hood	January 1990	+4.9
# 2 Caster Production	December 1990	+11.7
Ingot Teeming Shutdown	April 1991	-22.4
Shutdown of Blooming Mill	April 1991	-3.4
Shutdown of Batch Annealing	December 1991	-0.2
Road and Material Handling Fugitive Dust Controls	November, 1991 to Present	-32.0
Installation of #8 Galvanizing Line	Expected 1996	+4.2
Net Contemporaneous Change		**-37.2**
Proposed Production Increase	To Be Determined	-52.0
Net Emissions Change		**-89.2**

ESTIMATED CHANGE IN PM10 EMISSIONS

PROJECT	DATE	PM_{10} EMISSION CHANGE (tpy)
Remove Blast Furnace Slag Spout Hood	January 1990	+4.9
# 2 Caster Production	December 1990	+11.7
Ingot Teeming Shutdown	April 1991	-22.4
Shutdown of Blooming Mill	April 1991	-3.4
Shutdown of Batch Annealing	December 1991	-0.2
Road and Material Handling Fugitive Dust Controls	November, 1991 to Present	-32.0
Installation of #8 Galvanizing Line	Expected 1996	+3.8
Net Contemporaneous Change		**-37.6**
Proposed Production Increase	To Be Determined	+51.6
Net Emissions Change		**+14.0**

ESTIMATED CHANGE IN TSP EMISSIONS

PROJECT	DATE	PM_{10} EMISSION CHANGE (tpy)
Remove Blast Furnace Slag Spout Hood	January 1990	+4.9
# 2 Caster Production	December 1990	+11.7
Ingot Teeming Shutdown	April 1991	-22.4
Shutdown of Blooming Mill	April 1991	-3.4
Shutdown of Batch Annealing	December 1991	-0.2
Road and Material Handling Fugitive Dust Controls	November, 1991 to Present	-32.0
Installation of #8 Galvanizing Line	Expected 1996	+4.0
Net Contemporaneous Change		**-37.4**
Proposed Production Increase	To Be Determined	-60.6
Net Emissions Change		**-98.0**

On the basis of these calculations, the proposed production increases and additional dust controls will result in a net decrease in TSP emissions and an increase in PM_{10} emissions that is not significant. Because there is no significant increase in particulate matter emissions, the production increase will not trigger Nonattainment New Source Review for PM_{10} or TSP.

3.3.2.5 VOLATILE ORGANIC MATERIAL

The Blast Furnace Casthouse is the primary source of Volatile Organic Material (VOM) emissions increase that would result from the proposed production increase.

Table 3-6 presents the estimated increases in VOM emissions associated with the production increase. The total increase in VOM emissions is estimated at 59.3 tons per year. The increased emissions due to production increases were estimated by increasing 1993 emissions proportionally.

There have been four projects within the five year contemporaneous time frame which resulted in changes to VOM emissions. Appendix E presents information on the emission changing projects. Projects considered in calculating the net VOM emission change are listed in the table below.

PROJECT	DATE	VOM EMISSION CHANGE (tpy)
Installation NESHAP Controls Coke By-Product	July 1991	-31.6
Shutdown of Blooming Mill	April 1991	-0.9
Shutdown of Batch Annealing	December 1991	-0.3
Installation of #8 Galvanizing Line	Expected 1996	+1.6
Net Contemporaneous Change		**-31.2**
Proposed Production Increase	To Be Determined	+59.3
Net Emissions Change		**+28.1**

On the basis of these calculations, the proposed production increases and additional dust controls will result in a net decrease in TSP emissions and an increase in PM_{10} emissions that is not significant. Because there is no significant increase in particulate matter emissions, the production increase will not trigger Nonattainment New Source Review for PM_{10} or TSP.

3.3.2.5 VOLATILE ORGANIC MATERIAL

The Blast Furnace Casthouse is the primary source of Volatile Organic Material (VOM) emissions increase that would result from the proposed production increase.

Table 3-6 presents the estimated increases in VOM emissions associated with the production increase. The total increase in VOM emissions is estimated at 59.3 tons per year. The increased emissions due to production increases were estimated by increasing 1993 emissions proportionally.

There have been four projects within the five year contemporaneous time frame which resulted in changes to VOM emissions. Appendix E presents information on the emission changing projects. Projects considered in calculating the net VOM emission change are listed in the table below.

PROJECT	DATE	VOM EMISSION CHANGE (tpy)
Installation NESHAP Controls Coke By-Product	July 1991	-31.6
Shutdown of Blooming Mill	April 1991	-0.9
Shutdown of Batch Annealing	December 1991	-0.3
Installation of #8 Galvanizing Line	Expected 1996	+1.2
Net Contemporaneous Change		**-31.7**
Proposed Production Increase	To Be Determined	+59.3
Net Emissions Change		**+27.6**

On the basis of these calculations, the proposed production increase would result in a net increase in VOM emissions below the applicable significance level of 40 tons per year. Thus the production increase would not require a Nonattainment New Source Review for this pollutant.

3.3.2.6LEAD

Table 3-7 presents the estimated increases in lead emissions associated with the production increase. The total increase in lead emissions is estimated at 0.539 tons per year. The increased emissions due to production increases were estimated by increasing 1993 emissions proportionally to the increase in production.

On the basis of these calculations, the production increase results in increased lead emissions less than the 0.6 tons per year significance threshold. Therefore, a PSD Review for this pollutant is not required.

On the basis of these calculations, the proposed production increase would result in a net increase in VOM emissions below the applicable significance level of 40 tons per year. Thus the production increase would not require a Nonattainment New Source Review for this pollutant.

3.3.2.6 LEAD

Table 3-7 presents the estimated increases in lead emissions associated with the production increase. The total increase in lead emissions is estimated at 0.539 tons per year. The increased emissions due to production increases were estimated by increasing 1993 emissions proportionally to the increase in production.

On the basis of these calculations, the production increase results in increased lead emissions less than the 0.6 tons per year significance threshold. Therefore, a PSD Review for this pollutant is not required.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4.0
BEST AVAILABLE CONTROL TECHNOLOGY REVIEW

4.1 REQUIREMENTS AND APPLICABILITY

BACT is defined as an emission limitation based on the maximum degree of reduction of each pollutant subject to regulation which would be emitted from any proposed major stationary source or major modification which the Administrator (on a case-by-case basis, taking into account energy, environmental and economic impacts, and other costs) determines is achievable for such pollutant. BACT limitations must not cause the exceedance of any applicable New Source Performance Standards (NSPS) and/or National Emission Standards for Hazardous Pollutants (NESHAP).

The requirement to conduct a BACT analysis and determination is set forth in Section 165(a)(4) of the Clean Air Act and in federal regulations at 40 CFR 52.21(j). BACT must also comply with all the applicable limits established by the State of Illinois.

BACT is required for each regulated major source pollutant emitted in excess of the significant emission rates. Individual BACT determinations are to be performed for each pollutant subjected to a PSD review emitted from the same emission unit. The BACT determination must also separately address, for each regulated pollutant with a significant emission increase at the source, air pollution controls for each emissions unit or pollutant emitting activity subject to review.

Based on emission estimates for the proposed project, a BACT review is required for both SO_2 and CO control for the proposed project and is presented in the following format:

- BACT procedures
- Control Technology Review
- Previous BACT Determinations
- BACT Conclusion

Preparation of the BACT analysis included in this document incorporates the most recent "top-down" BACT guidance (EPA, 1990) by United States Environmental Protection Agency (USEPA) for PSD permit determinations. That is, for each pollutant, the most stringent emission limit potentially applicable for a given pollutant was considered and then compared to the proposed project to determine its technical and economic feasibility.

When the most stringent technically feasible emission limitation is not selected as BACT, justification must be provided in terms of adverse economic, environmental, or energy impacts. Several other factors may be considered in justification of rejecting more stringent controls, including:

a. A showing that utilizing the control would adversely impact the project's financial viability.

b. A showing that the costs associated with the control are significantly higher for this specific project than for other similar projects that have installed this control system or in general for controlling the pollutant.

c. A showing that those economic considerations outweigh the energy and environmental benefits.

4.2 SO_2 CONTROL TECHNOLOGY REQUIREMENTS AND APPLICABILITY

The sources of SO_2 emissions impacted by the proposed production increases and considered as a part of the BACT review include the blast furnace stoves, the blast furnace casthouse, the ladle dryer preheater and the continuous casters. The increase in iron-making by the blast furnaces may correspondingly increase the production of process blast furnace gas.

4.2.1 INHERENTLY LOWER-EMITTING PROCESSES/PRACTICES

4.2.1.1 Blast Furnace Stove and Boiler Emissions

The blast furnace stoves will burn increased amounts of blast furnace gas and comparable amounts of natural gas to accommodate the production increase. Due to the low concentrations

of SO_2 and other pollutants in blast furnace gas and natural gas, these products are typically thought of as clean burning fuels[1].

Emissions of SO_2 will be impacted by the quantity of fuel required and the sulfur content of the fuel. For example, blast furnace gas has trace amounts of sulfur but is lower in heating value than natural gas or fuel oil. Therefore, it takes a much greater volume of blast furnace gas to provide the same heat energy as these other fuels. The greater volume and respective sulfur concentration must be compared to the lower volumes and respective sulfur concentration for natural gas or fuel oil to determine a lower emitting practice.

Based on fuel data for each type of fuel used, the lowest emitting fuel for SO_2 is natural gas (approximately 6.0×10^{-4} lbs/mmBtu). The next lowest emitting fuel for SO_2 is blast furnace gas (approximately 8.3×10^{-2} lbs/mmBtu).

There may be a small increase in fuel oil use associated with the production increase. Fuel oil combustion results in SO_2 emissions of approximately 1.0 lb/mmBtu. During the base period little oil was combusted. The projected oil use is based on the amount of oil reclaimed from Granite City Steel's wastewater treatment system. Oil generated through this pollution prevention technique is presently being sold; however, Granite City Steel must maintain the ability to consume this oil internally should future requirements preclude the sale of this material.

Increased quantities of blast furnace gas will be produced by the blast furnaces with the proposed production increase. If this fuel is not used in the blast furnace stoves or in other combustion sources, it must be flared. Although blast furnace gas is a higher SO_2 emitting fuel than natural gas, substituting natural gas at the blast furnace stoves would still result in the combustion of the blast furnace gas at the flare. Therefore, combustion of blast furnace gas in the blast furnace stoves is the inherently lowest emitting practice on a plant-wide basis.

4.2.1.2 Casthouse Emissions

As discussed in Section 2.2, SO_2 emissions from iron-making operations are limited by process practices employing limestone and other fluxing agents in the burden. Due to the reducing

atmosphere and the fluxes used in the furnace burden to remove impurities, wide ranges of sulfur in the burden are efficiently removed (98+%), predominately into the slag.

Approximate 60% of the sulfur in the coal used to make coke remains in the fuel. Therefore, reducing the sulfur content of the coal used to make coke that is part of the charge to the blast furnace was considered. However, this is not an effective means of reducing SO2 emissions because greater than 98% of the sulfur in the blast furnace burden is removed by the process. Thus, for every pound of sulfur in coal used to make coke, more than 0.988 pounds of sulfur are removed.

1 lb S *(1-0.6) =	0.400 lbs S removed when making coke
0.6 lb S * 0.98 =	0.588 lb S removed by the process
	0.988 lb S removed

As shown, due to the effectiveness of the process in reducing sulfur, reduction in the sulfur content of the coal used would have an insignificant effect on sulfur dioxide emissions.

Some trace amounts of sulfur are also in the iron. The necessary burden practice of adding limestone and fluxes effectively and effectively reduces SO_2 emissions to trace amounts[4]. No other lower emitting practices are in use in the steel industry[3,4,5].

4.2.1.3 Ladle Dryer Preheater and Continuous Caster Emissions

The ladle dryer preheater and continuous casters may require an increase in fuel usage as a result of the production increase. However, because natural gas is the only fuel used at these units, the lowest emitting practice is in place and will continue to be employed.

4.2.2 SO_2 CONTROL TECHNOLOGY OPTIONS

There are no add-on SO_2 control technologies currently in use in the steel industry for SO_2 control at blast furnace stoves using process blast furnace gas, or to control SO_2 at the blast furnace casthouse, ladle dryer preheater and continuous casters.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4.2.3 INFEASIBLE OPTIONS - SO_2

The proposed production increases to the blast furnaces will result in increased blast furnace gas generation and require additional fuel combustion in the blast furnace stoves. Blast furnace gas and natural gas are considered clean fuels and are the preferred supplemental fuels for the increased combustion needs based on inherently lower emitting practices.

Blast furnace gas is a low Btu fuel (approximately 80 Btu/cubic feet). Because of its low Btu value, large volumes of blast furnace gas are necessary to produce the required heat energy for the proposed production increases. Because the use of blast furnace gas in some processes is limited by other factors, such as physical limitations of the gas lines and burners, natural gas may also be used as a supplemental fuel. However, the overall quantity of natural gas usage throughout the plant will remain constant.

Blast furnace gas and natural gas typically contains approximately 0.01 and 0.001 percent sulfur (by weight). Based on these low sulfur concentrations, SO_2 reduction using add-on controls is technically infeasible.

4.2.4 SELECTED BACT - SO_2

Based on a review of the BACT/LAER clearinghouse, information obtained from the U.S. EPA Control Technology Group, and literature from the U.S. EPA Office of Air Quality Planning and Standards, no add-on BACT determination has been made for SO_2 emissions at these sources. Based on the extremely low concentrations of SO_2 in blast furnace gas, control of SO_2 emissions at blast furnace stoves is not practiced in the steel industry[3,4,5].

The combustion of blast furnace gas in the blast furnace stoves to supplement existing fuel combustion is the only feasible option to support the proposed production increases. Therefore, this option is determined as BACT for SO_2.

Sulfur dioxide emissions from the blast furnace casthouse are effectively controlled by the solubility of sulfur containing gases in the liquid iron and the efficiency of fluxing to remove impurities, including SO_2. Based on the low SO_2 concentrations in casthouse emissions,

additional reduction using add-on controls is technically infeasible. SO_2 emissions from the blast furnace casthouse are effectively reduced by using current industry work practices. This option is selected as BACT for casthouse SO_2 emissions.

The use of natural gas in the ladle dryer preheater and continuous casters is the only feasible control option to support the proposed production increases based on inherently lower emitting practices.

4.3 CO CONTROL TECHNOLOGY REQUIREMENTS AND APPLICABILITY

The major sources of CO emissions impacted by the proposed production increases include the blast furnace stoves, the basic oxygen furnaces (BOF), the ladle dryer preheater and the continuous casters. CO emissions may increase as a result of additional process blast furnace firing in the stoves, additional steel production at the BOF and additional fuel requirements at the ladle dryer preheater and continuous casters. A BACT review requires an evaluation of inherently lower-emitting processes/practices and technically feasible add-on controls.

4.3.1 INHERENTLY LOWER-EMITTING PROCESSES/PRACTICES

4.3.1.1 Blast Furnace Stoves

CO formation results from the incomplete combustion of fossil fuels and oxidation of carbon containing materials. The better the combustion practices, the lower the CO formation.

Good combustion practices require the following elements:

- Proper fuel/air mixture
- Proper mixing
- High temperature

Good combustion practice is the inherently lowest emitting method of controlling CO emissions from combustion sources[2,6].

4.3.1.2 Basic Oxygen Furnaces (BOF)

CO is formed in the BOFs by oxidizing carbon in the molten iron. Because high-purity oxygen is the industry standard for making steel, there is no lower-emitting practice for this source.

4.3.1.3 Ladle Dryer Preheater and Continuous Casters

The ladle dryer preheater and continuous casters may require an increase in fuel usage as a result of the production increase. However, because natural gas is the only fuel used at these units, the lowest emitting practice is in place and will continue to be employed.

4.3.2 CO CONTROL TECHNOLOGY OPTIONS

The following control technologies are currently available to control CO emissions from affected sources.

4.3.2.1 Blast Furnace Stoves

The following add-on control technology options are currently available to control CO emissions from the blast furnace stoves:

- Direct Combustion (flaring)
- Thermal Oxidization
- Catalytic Oxidation

Direct Combustion

Flaring is a combustion control process in which combustible gases are burned in an open flame in the open air using a specially designed burner tip. Completeness of combustion in a flare is governed by flame temperature, residence time in the combustion zone, turbulent mixing, and available oxygen. The major factors affecting flare combustion efficiency are gas flammability, auto-ignition temperature, heating value (Btu/scf), density, and flame zone mixing.

The heating value affects flame stability, emissions, and flame structure. A lower heating value produces a cooler flame that does not favor combustion and is more easily extinguished.

Thermal Oxidizers

Thermal oxidizers refer to any device that uses a flame combined within an enclosed chamber to convert combustible gases to carbon dioxide and water. Thermal oxidizers operate most effectively at temperatures between 1,300 to 1,500°F with a residence time of 0.1 to 0.5 seconds. By raising the temperature, the residence time for complete combustion can be reduced and vice versa. However, temperature is the more important process variable. The removal efficiency for CO is in the range of 90 to 95 percent.

Besides temperature and residence time, the concentration of the pollutant in the gas stream also affects operation of the system. The concentration of the pollutant dictates the amount of supplemental fuel required. Low concentrations of the combustible gas require increased supplemental fuel usage.

Catalytic Oxidation

Catalytic incinerators employ a bed of active material (catalyst) that facilitates the overall combustion reaction. The catalyst is a substance that speeds up the rate of a chemical reaction at a given temperature without being permanently altered. The use of a catalyst in an enclosed combustor enables oxidation at temperatures in the range of 500 to 600°F. Common catalysts used in catalytic oxidation units are platinum or other metals. The catalysts are placed on an alumina pellet or honeycomb support. The typical removal efficiency with this type of control is 90 percent.

Certain contaminants contained in the exhaust gas streams will chemically react or alloy poison with the catalyst and cause deactivation, including most heavy metal compounds. Sulfur is also considered a catalyst poison, but its effect is reversible.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

4.3.2.2 Basic Oxygen Furnaces (BOF)

The BOF receives a charge composed of approximately 30 percent scrap and 70 percent molten iron and converts it to molten steel by utilizing a jet of high purity oxygen. The oxygen oxidizes the carbon and silicon in the molten iron, removes them, and provides heat for melting scrap.

Two primary systems for hooding and combustion of the BOF gases are currently used. The following control technologies are currently available and in use to control CO emissions from BOF vessels.

- Closed-hood combustion with exhaust stack flare
- Open-hood combustion with no additional controls

Closed-Hood Combustion w/Flare

A closed hood system suppresses combustion at the hood and collects the gases for combustion of CO at an exhaust stack flare. In a closed-hood system movable skirts seal the top of the furnace to limit air induction. Suppressed combustion hoods discourage air infiltration, with as low as 5 percent theoretical air. By suppressing combustion, the CO concentration is increased and the gases are more easily flared.

Open-Hood Combustion

Open combustion hoods allow excess air to be introduced in quantities up to 300 percent. With open hoods there is a gap between the hood and the furnace top into which air can be induced. In an open-hood system CO gases are combusted in the primary hood system with the addition of the excess air.

4.3.2.3 Ladle Dryer Preheater and Continuous Casters

There are no add-on CO control technologies currently in use in the steel industry for CO control at the ladle dryer preheater or continuous casters.

4.3.3 INFEASIBLE OPTIONS - CO

Low concentrations of CO are not effectively and efficiently controlled by emissions control devices[8]. Due to the low concentrations of CO gas in the exhaust stream of the blast furnace stoves, which are below the lower explosive limit (LEL) of 12.5 percent for CO, sustained combustion (flaring) cannot occur[7] without the use of a supplemental fuel. Because the use of supplemental fuel at the flare would result in higher emissions of other pollutants and the formation of additional CO, this is an infeasible option.

The Granite City facility is already equipped with an open hood system on the BOFs where CO is combusted in the hood. Switching to a closed-hood system would require a large capital expense and would be economically infeasible. The residual CO from open-hood combustion is at a concentration level that is not technically feasible to treat further.

4.3.4 SELECTED BACT - CO

A review of BACT/LAER Clearinghouse, U.S. EPA Control Technology Group, and U.S. EPA Office of Air Quality and Planning literature was conducted to determine the current BACT status for sources within the steel industry. Based on this review and the previous evaluation of BACT options, the following BACT determinations for CO were made for sources impacted by the proposed production increases.

4.3.4.1 BACT - Blast Furnace Stoves

BACT literature indicates that blast furnace stoves at steel mills are not using add-on control equipment for CO emissions control. CO emissions can be adequately controlled by the use of

good combustion practices. Therefore the BACT recommendation for control of CO emissions from the blast furnace stoves is the maintenance of present good combustion practices.

4.3.4.2 BACT - Basic Oxygen Furnaces (BOF)

The open hood system used by Granite City Steel is a process control with the CO being combusted in the hood system. This type of process does not use add-on controls. After combustion in the open hood system, the CO average concentration is approximately 2500 ppm. This concentration is too low for additional CO control to be technically feasible[8]. Therefore, the existing open hood system, operated in the manner necessary to produce a quality product, is determined to be BACT for the BOFs.

4.3.4.3 BACT - Ladle Dryer Preheater and Continuous Casters

The use of natural gas is the only feasible control option based on inherently lower emitting practices and there are no add-on CO control technologies currently in use in the steel industry for CO control at the ladle dryer preheater and continuous casters. Therefore, the use of natural gas is determined to be BACT for the ladle dryer preheater and continuous casters.

5.0
AIR QUALITY IMPACT ASSESSMENT

5.1 BACKGROUND

The proposed production increase at National Steel Corporation's Granite City Steel mill will result in a facility-wide net emission increase of carbon monoxide (CO) and sulfur dioxide (SO_2) of greater than 100 and 40 tons per year, respectively. Therefore, the proposed production increase constitutes a major modification to an existing major stationary source, and subject the mill (for the respective pollutants) to the Federal Clean Air Act's (CAA) New Source Review (NSR) process.

The NSR process requires a major stationary source undergoing a major modification to demonstrate that the modification will not cause or contribute to an exceedance of the National Ambient Air Quality Standards (NAAQS). NSR also requires the source to demonstrate that emissions of specific attainment air pollutants will not deteriorate the existing air quality above incremental amounts established by the CAA. Federal and state regulations have been developed to meet the requirements set forth in the CAA.

The Prevention of Significant Deterioration (PSD) program is a part of the NSR process that states have implemented for major new and modified sources of air pollution, in regions currently in attainment the NAAQS. An air quality impact assessment is one of the requirements which must be conducted in order to receive a PSD permit to construct or modify a source. This section will address the air quality impact assessment requirements which are necessary to receive a PSD permit. The air quality analyses presented in this section satisfy the regulatory requirements given in the Code of Federal Register 40 CFR 52.21(k) and 40 CFR 52.21(m).

Once source and pollutant applicability have been determined, dispersion modeling is typically used to estimate potential ambient pollutant impacts from a major modification. Initially, only

the incremental emission increases resulting from the major modification are modeled. If the impacts from these emissions exceed the CAA's ambient significance levels, a more refined modeling analysis must be conducted to demonstrate overall compliance with NAAQS and PSD increments. **Table 5-1** provides the ambient significance levels for CO and SO_2 impacts. **Table 5-2** presents the CO and SO_2 NAAQS (The Illinois Ambient Air Quality Criteria Pollutant Standards are identical to the NAAQS). **Table 5-3** lists the applicable Class II PSD SO_2 increments.

Another set of ambient impact limits which are applicable to PSD reviews are the de minimis ambient monitoring concentrations given in **Table 5-4**. These concentrations are used to determine whether site specific ambient air monitoring may be required prior to construction or modification. Concentrations greater than the values presented in **Table 5-4** could require preconstruction monitoring for up to a year, however, nearby existing representative monitoring data can often be substituted if available, approved by IEPA, and QA/QC certified according to federal guidelines.

The Illinois Environmental Protection Agency (IEPA) has recently conducted extensive dispersion modeling analyses in and around the Granite City Steel mill. The purpose of this modeling was to demonstrate NAAQS attainment for SO_2 and particulate matter. The IEPA modeling successfully demonstrated NAAQS compliance based on federally enforceable state operating permit (FESOP) SO_2 and PM_{10} emission rates for the Granite City Steel mill. SO_2 emission rates proposed for the production increases are no greater than the proposed FESOP limits. Therefore, NAAQS modeling will not be performed.

IEPA also provided a major portion of the data used in the modeling analyses. Included in the data provided are:

- meteorology (five years surface and upper air);
- receptors (three grid files of varying resolution and coverage);
- stack parameters; and
- downwash and wake effect parameters.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5.2 AREA DESCRIPTION

The Granite City Steel mill is located in Madison County, Illinois. Madison County is located in east-central Illinois. The largest city near the mill is St. Louis, Missouri which is located approximately 15 kilometers southwest of the site. The Granite City Steel mill is situated at a surface elevation of approximately 420 feet above mean sea level. The elevations within a five kilometers radius of the site range from 400 to 430 feet, which are below the stack height elevations of all existing sources at the mill. Therefore, the site is located in an area consisting of simple terrain, and terrain elevations were not included as part of the modeling analyses.

Based on classification systems recognized by the EPA, the project area can be classified as rural. EPA guidance presents two alternative procedures to determine whether the character of an area is predominately urban or rural: 1) land use or 2) population density. The area classification system developed by Auer (1978) was used to classify the area as rural, based on color codes on the USGS maps and population density.

5.3 MODEL SELECTION

A dispersion modeling analysis for the Granite City Steel mill was performed using USEPA computer models which evaluate the ambient impact of air pollution sources by simulating the processes of transport and diffusion of effluents in the atmosphere. The procedures recommended by USEPA Region V, the Illinois Environmental Protection Agency (IEPA), and the *Guideline on Air Quality Models* (Revised), (EPA-450/12-78-027R) were followed for the modeling analysis.

The revised Industrial Source Complex Short Term (ISCST2) model, version 93109 and the more recent ISCST3 models were selected to predict ambient concentration increases. The ISCST model is frequently used in PSD modeling analyses and has gained wide acceptance by the modeling community since options are available to depict emission rate scalars, particle size data, building wake effects and downwash, cavity effects, and various types of emission sources.

The ISCST model is a steady-state Gaussian plume model designed to estimate ground-level pollutant concentrations from a wide variety of sources associated with an industrial complex in an area having simple terrain. The ISCST model utilized the regulatory default options including the following:

- final plume rise;
- stack-tip downwash;
- buoyancy-induced dispersion; and
- no calms processed

5.4 METEOROLOGICAL DATA

The dispersion modeling analysis was performed using five years (1982-86) of hourly surface meteorological data from the St. Louis International Airport (No. 13994) and twice-daily upper air meteorological data from the Salem Regional Airport (No. 03879). The meteorological data was recommended and supplied to Granite City Steel by the IEPA, and was previously used to conduct dispersion modeling analyses for SIP NAAQS attainment demonstrations. These data were received from IEPA in a preprocessed binary format compatible with the requirements of the ISCST2 model. The meteorological data consisted of hourly observations for the following parameters:

- Wind speed
- Wind direction
- Ambient temperature
- Atmospheric stability
- Mixing heights

These data were used to calculate hourly plume rise and pollutant concentrations at downwind receptor locations for averaging periods of up to a year. Each year was processed individually and maximum predicted concentrations for the worst-case year are reported in the modeling results.

The St. Louis Airport is located approximately 25 kilometers west of the mill and the Salem Regional Airport is located approximately 100 kilometers east of the mill. Both data sets are considered representative of the meteorological conditions in Madison County, Illinois. IEPA stated that the surface meteorological was collected at a sampling height of 6.1 meters instead of the standard 10 meters. The non-standard height was included in the modeling runs.

5.5 RECEPTORS

The five-year dispersion modeling analysis utilized three IEPA generated UTM Cartesian receptor grids with varying spacing (1 to 1,000 meter) and coverage. Potential near-source impacts due to downwash and wake effects were assessed utilizing fenceline receptors generated by IEPA and incorporated into three grids provided. Since terrain elevations are fairly constant, the modeling analysis was performed using only simple terrain (no terrain elevations). A copy of the receptor grid files are provided in Appendix G.

5.6 PRECONSTRUCTION AMBIENT AIR QUALITY MONITORING

Preconstruction monitoring of the air quality in the area near a proposed major modification is required by the PSD regulations to determine existing background pollutant concentrations prior to evaluating the impacts of the proposed major modification. The PSD regulations stipulate preconstruction monitoring is required if the maximum predicted (modeled) ambient impact concentration exceeds the de minimis PSD monitoring threshold. However, in lieu of a preconstruction monitoring requirement, the IEPA can designate existing representative monitoring data from a nearby site, if available, and if QA/QC certified according to federal guidelines.

The IEPA monitors CO in Madison County at 2001 Edison Street. This location is approximately 3 blocks (<0.5 kilometers) northwest of the Granite City Steel mill. This location should be considered nearby and representative of background conditions at the site. Therefore, preconstruction monitoring should not be necessary.

The IEPA monitors SO_2 in Madison County at four locations. The nearest monitoring station to the Granite City Steel mill is located in South Roxanna. This monitoring station is approximately 16 kilometers northeast of the Granite City Steel mill. However, because IEPA has already conducted extensive NAAQS SO_2 modeling and determined compliance for the area based on this modeling (at least in-so-far as it relates to the Granite City Steel mill), preconstruction monitoring should not be necessary.

The 1993 Illinois Annual Air Quality Report states that the maximum 1-hour CO average was 8.0 parts per million (9,200 $\mu g/m^3$) and the maximum 8-hour CO average was 3.7 parts per million (4,255 $\mu g/m^3$). These levels are below the 40,000 and 10,000 $\mu g/m^3$ 1-hour and 8-hour NAAQS, respectively.

The 1993 Illinois Annual Air Quality Report states that the maximum 3-hour SO_2 average was 0.171 parts per million (447 $\mu g/m^3$), the maximum 24-hour SO_2 average was 0.063 parts per million (164 $\mu g/m^3$), and the annual SO_2 average was 0.011 parts per million (28.6 $\mu g/m^3$). These levels are below the 1,300, 365, and 80 $\mu g/m^3$ 3-hour, 24-hour and annual NAAQS, respectively.

5.7 SOURCE DATA

The proposed production increases at the Granite City Steel mill will be achieved utilizing existing production equipment. Therefore, only the total emissions from the existing source points will change. The source parameters (stack height, temperature, etc.) are expected to remain the same.

The source data for the SO_2 and CO sources affected by the proposed production increases are presented in **Table 5-5**. The primary source points at the mill are the blast furnace stoves, boilers, baghouse, the ladle preheater/dryer stacks, the blast furnace casthouse and roof vents, the iron spout baghouse vent, slag pits and the continuous caster stacks. The ladle preheater/dryers were assumed to exhaust through a single stack for this modeling analysis.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5.8 MODELING PROTOCOL

The dispersion modeling analysis was conducted in four steps. Initially, worst-case individual impacts were determined by modeling each source individually for the five year period. From this modeling, a worst-case combined impact was determined by adding together all individual worst-case impacts regardless of time period (within an averaging period) or receptor location. If this process demonstrated that the combined impacts were below the CAA ambient significance levels, NAAQS levels, or applicable PSD Class II increments, no further analyses were conducted. If, however, the combined impacts were calculated to be above the NAAQS levels (with background levels included) or PSD Class II increments, a refined modeling analysis (taking into account the same time period and receptor locations) was performed to evaluate the specific combined impact cases which appeared to exceed the NAAQS or PSD increments

5.8.1 INDIVIDUAL IMPACT MODELING

To determine the individual worst-case impacts, a Chi/Q modeling analysis was conducted utilizing a nominal emission rate of one gram per second for each source. Once the modeling was completed, the applicable emission rates "Q" (in grams per second) for each individual source were multiplied to the Chi/Q impacts and the worst-case individual source impacts were determined.

For example, the maximum eight-hour Chi/Q impact from the basic oxygen furnace (BOF) for the five year modeling period was 5.3327 $\mu g/m^3$ (1982). Multiplying this impact to the 174.12 gram per second increase in CO emissions from the proposed production increases to the BOF results in a maximum eight-hour CO impact of 928.5 $\mu g/m^3$.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5.8.2 COMBINED IMPACT MODELING

Once the individual worst-case impacts were determined, the next step was to evaluate the worst-case combined impacts. To achieve this, it was first necessary to separate the combustion sources from the process sources.

Combustion sources (in this assessment) are defined as sources that burn fuels for the sole purpose of generating steam or thermal energy. These sources can be used interchangeably, that is, fuel burned in one source can be switched immediately to a different source. Therefore, to determine the worst case impacts from the combustion sources (and to maximize operating flexibility), the total emissions from all additional fuel combustion were applied to each combustion source, and the combustion source that was determined to have the highest impact (Boiler 12) was used in the combined impact analysis.

The worst-case combustion source impacts (Boiler 12) were then added to the worst-case individual process source impacts to arrive at a combined worst-case impact. These impacts were then compared to the CAA's ambient significant impact levels. If the significant impact levels were exceeded, the combined impacts were compared to the applicable NAAQS or PSD Class II increment. If the NAAQS or PSD Class II increments were exceeded, additional modeling was required.

5.8.3 REFINED MODELING

If the worst-case combined impacts were greater than the NAAQS (CO) or the PSD Class II increments (SO_2), refined modeling would be necessary. Since IEPA has already conducted extensive modeling to demonstrate SO_2 NAAQS compliance, this modeling was not repeated.

Refined modeling combines the applicable sources into a single modeling run and evaluates the combined impacts of these sources on particular receptor locations and at particular time periods. This modeling typically results in much lower combined impacts because it is unlikely that two or more sources are impacting on the same receptor point at the same time.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

5.9 MODELING RESULTS

The results of the dispersion modeling indicate that the proposed production increases will not cause or contribute to a violation of a NAAQS, or cause an exceedance of an applicable PSD Class II increment.

5.9.1 SIGNIFICANT IMPACT DETERMINATION

As described in Section 5.9.1, individual Chi/Q modeling was conducted for all CO and SO_2 sources impacted by the proposed production increases. **Table 5-6** gives the individual and worst-case combined CO modeling results, and **Table 5-7** gives the individual and worst-case combined SO_2 modeling results.

The worst-case combined 1-hour impact levels for CO are 3,164.5 $\mu g/m^3$. This impact is greater than the applicable significant impact level of 2,000 $\mu g/m^3$. Likewise, the worst-case combined 8-hour impact level for CO was 960.3 $\mu g/m^3$, which is greater than the 500.0 $\mu g/m^3$ applicable significant impact level. Therefore, the CO impacts are considered significant and require further evaluation for NAAQS compliance.

The worst-case combined 3-hour, 24-hour and annual impacts for SO_2 are modeled to be 345.3, 32.6 and 7.1 $\mu g/m^3$, respectively. These impacts are greater than their respective 25, 5 and 1 $\mu g/m^3$ applicable significant impact levels. Therefore, the SO_2 impacts are also significant and require further evaluation for PSD Class II increment consumption.

5.9.2 NAAQS DETERMINATION - CO

Table 5-8 presents the individual and worst-case combined modeling results for all CO sources at the Granite City Steel mill. Based on these modeling results, the worst-case combined 1-hour impacts from the Granite City Steel sources is 9,827.8 $\mu g/m^3$. If a representative background concentration of 9,200 $\mu g/m^3$ is added to this impact, the total worst-case 1-hour

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

impact is 19,027.8 $\mu g/m^3$. This impact is below the NAAQS of 40,000 $\mu g/m^3$, therefore, the production increase does not cause or contribute to a 1-hour CO NAAQS exceedance.

Based on the modeling results, the worst-case combined 8-hour impacts from the Granite City Steel sources is 2,871.4 $\mu g/m^3$. If a representative background concentration of 4,255 $\mu g/m^3$ is added to this impact, the total worst-case 8-hour impact is 7,126.4 $\mu g/m^3$. This impact is below the NAAQS of 10,000 $\mu g/m^3$; therefore, the production increase does not cause or contribute to an 8-hour CO NAAQS exceedance.

5.9.3 PSD CLASS II INCREMENT CONSUMPTION - SO_2

SO_2 increment is consumed by sources in a specific area that increase their emission of SO_2 after the SO_2 baseline date has been established for that area. The increment can be expanded in a similar fashion if sources in a specific area decrease their SO_2 emissions after the baseline date. Based on data provided by IEPA, the SO_2 baseline date was established for the Kilngas - Wood River Gas Turbine project in December 1982. This project was eventually canceled. Since this time, two additional PSD projects that would have been potential SO_2 increment consumers were proposed and ultimately canceled.

IEPA and Granite City Steel were unable to identify the number and magnitude of minor source increment changes that have occurred since 1983. However, SO_2 monitoring data for Madison County indicate that SO_2 concentrations are remaining constant or trending downward. Therefore, we can conclude that at least the full Class II PSD increments for SO_2 should be available.

Table 5-7 presents the individual and worst-case combined modeling results for all SO_2 sources affected by the proposed production increases at the Granite City Steel mill. The worst-case combined impact for the 3-hour averaging period was 345.3 $\mu g/m^3$, for the 24-hour averaging period was 99.1 $\mu g/m^3$, and for the annual averaging period was 7.1 $\mu g/m^3$. Based on these

results, the worst-case combined impacts are at or below the 3-hour and annual Class II PSD SO_2 increments of 512 and 20 $\mu g/m^3$, respectively. However, the maximum 24-hour impact was estimated to be 99.1 using this conservative method. That impact is greater than the applicable 24-hour PSD increment of 91 $\mu g/m^3$. Therefore, additional analysis was required for the 24-hour averaging period.

5.9.3.2 Increment Consumption Based on Refined Modeling

Refined modeling was carried out for the 24-hour averaging period. This modeling used the same source assumptions that were used for the previous modeling (e.g. assumption that all incremental fuel was used by one combustion source). Each combustion source was modeled in turn with the process sources to estimate a maximum a maximum ground level concentration, this time adding the predicted concentrations for each source at each receptor location. As shown on Table 5-9, this analysis shows that the maximum concentration predicted at any receptor is 32.6 $\mu g/m^3$, well below the 24-hour PSD increment for SO_2 of 91 $\mu g/m^3$.

6.0
ADDITIONAL IMPACT ANALYSES

The additional impact analyses required under 40 CFR 52.21(o) are the following:

1. Air quality impacts in Class I areas within 100 km;
2. Visibility impacts in Class I areas within 100 km;
3. Impacts on soils and vegetation that would result from the modification;
4. Impacts on endangered species; and
5. Socioeconomic analysis

The air quality modeling projections performed in Section 5.0 and by IEPA have demonstrated that the proposed modification will not cause or contribute to an exceedance of the applicable National Ambient Air Quality Standard (NAAQS), or cause an exceedance of a PSD Class II increment. The same can be said for any other anticipated effects that the proposed modification might have upon the surrounding areas of Madison county. Although the source impact analysis is a quantitative, mathematical determination evaluated in relative numerical terms, other impact analyses are generally more qualitative and descriptive in nature. The following sections summarize those additional considerations and demonstrate in each case that the proposed modification will produce no adverse effects.

6.1 AIR QUALITY IMPACTS IN CLASS I AREAS

The Clean Air Act Amendments require evaluation of new emission sources to determine potential impact on air quality in Class I areas. Mandatory Class I areas include international parks, national wilderness areas, national memorial parks and other areas redesignated to Class I areas by the state.

The nearest Federal Class I area to the Granite City Steel mill is the Mingo National Wilderness Area which is approximately 210 km southwest of the mill. The next closest Class I area (Hercules-Glades) is about 330 km southwest of the mill. The distance from the Class I area to

the mill is greater than 100 km; therefore no air quality impact analyses were performed to evaluate impacts within the wilderness area.

6.2 VISIBILITY IMPACT ANALYSIS IN CLASS I AREAS

The Clean Air Act Amendments require evaluation of new emission sources to determine potential impact on visibility in Class I areas. Mandatory Class I areas include international parks, national wilderness areas, national memorial parks and other areas redesignated to Class I areas by the state. The nearest Class I area is the Mingo National Wilderness Area in Popular Bluff, Missouri, located approximately 210 km south-west of Granite City mill.

The current regulation governing PSD review addresses the prevention of visibility impairment in federal Class I areas. No visibility impact analysis for the Class I area was performed, as the nearest Class I area is more than 100 km from the Granite City mill and no impact is expected.

6.3 IMPACTS ON SOILS AND VEGETATION

Impacts on soils and vegetation applies only to those areas in which there is vegetation of significant commercial or recreational value. There are no vegetation or soil types in Granite City area which would be harmed by concentrations of criteria pollutants below the national ambient air quality standards. Therefore, no soils or vegetation analyses are required for the proposed modification.

6.4 IMPACTS ON ENDANGERED SPECIES

No impacts will occur to any listed endangered or threatened species, since none are known or likely to occur in the project area.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

6.5 SOCIOECONOMIC ANALYSIS

The proposed modification at the Granite City mill will have a positive economic impact for the company and therefore, for the community surrounding the mill. The infrastructure surrounding the mill is already established due to the existing industrial nature of the area. Therefore, it is not anticipated that there will be secondary air quality impacts due to the increase in production.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct a sulfur dioxide compliance test program on the Blast Furnace Iron Spout Baghouse exhaust stack on July 1, 1993.

Methodology

Sampling was conducted following USEPA Methods 1-4 and 6 as detailed in the Code of Federal Regulations, CFR40, Part 60, 1992 and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from two 3" diameter test ports located on on the stack exhaust. The test ports were located eight diameters downstream and two diameters upstream from the last flow disturbances. The stack diameter at this sampling location was 82 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 8 points on two traverses for a total of 16 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas CO_2, O_2 and N_2 Content (USEPA Method 3)

The stack gas molecular weight was determined following EPA Method 3. Gas samples were collected in a 60 liter Tedlar bag using ARI's integrated bag collection system and analyzed for CO_2, O_2 and N_2 (by difference) using a Hays Orsat type gas analyzer after each sampling run.

Stack Gas Moisture Content (USEPA Method 4)

Moisture sampling was conducted simultaneously with the sulfur dioxide sampling per USEPA Method 4 using large EPA Method 5 impingers.

Sulfur Dioxide Determination (USEPA Method 6)

Sulfur dioxide sampling was conducted in accordance with EPA Method 6 using large EPA Method 5 impingers.

The first impinger contained 100 mls of 80% IPA to collect SO_3. The second, third and fourth impingers contained 100 mls of 10% hydrogen peroxide. The fifth impinger contained 200 grams of silica gel.

The test repetition times varied with each batch cycle time. The test times were 77, 83 and 67 minutes for runs 1 through 3, respectively.

A final leak check and 20 minute purge were conducted at the completion of each run.

The SO_2 samples were analyzed at ARI's laboratory using standard titrations to a thorin endpoint with barium chloride as specified in EPA Method 6.

Dear Sir:

Subject: July 1, 1993 Blast Furnace Simultaneous Cast Emissions Compliance Test results for the Casthouse and Iron Spout Baghouses.

Attached please find "The Final Report" regarding the July 1st emission test as required by special conditions 4e, g, and h of the Construction Permit for the Blast Furnace and Basic Oxygen Furnace Production Increase (application no. 92090104) for Granite City Division.

Compliance was achieved in accordance with USEPA Methods 1-5, 6, 6c, 7e, 9, and 25a. The attached information indicates the following emissions rates:

BLAST FURNACE CASTHOUSE BAGHOUSE

Emissions Type	Avg. Conc.	Limit
Particulate	.003 gr/dscf	.010 gr/dscf
Sulfur Dioxide	96.1 lbs/hr	n/a
Nitrogen Oxide	6.9 lbs/hr	n/a
VOM (as C_1)	40.6 lbs/hr	n/a

BLAST FURNACE IRON SPOUT BAGHOUSE

Emissions Type	Avg. Conc.	Limit
Sulfur Dioxide	3.5 lbs/hr	n/a

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct an emission compliance test program on the Blast Furnace Cast House Baghouse exhaust stack on July 1, 1993.

The purpose of this formal test program was to determine total particulate, sulfur dioxide (SO_2), nitrogen oxides (as NO_2) and volatile organic compounds (as C_1) emissions over the duration of simultaneous casting operations.

Methodology

Sampling was conducted following USEPA Methods 1-5, 6C, 7E and 25A as detailed in the Code of Federal Regulations, CFR40, Part 60, 1992 and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from four 3" diameter test ports located on the stack exhaust. The test ports were located two diameters downstream and one-half diameters upstream from the last flow disturbances. The stack diameter at this location was 132.0 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 6 points on four traverses for a total of 24 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas CO_2, O_2 and N_2 Content (USEPA Method 3)

The stack gas molecular weight was determined following EPA Method 3. Gas samples were collected in a 60 liter Tedlar bag using ARI's integrated bag collection system and analyzed for CO_2, O_2 and N_2 (by difference) using a Hays Orsat type gas analyzer after each sampling run.

Stack Gas Moisture Content

Moisture sampling was conducted simultaneously with the particulate sampling in the back half of the Method 5 sampling train per USEPA Method 4.

Stack Particulate Sampling Train

The particulate sampling train used during the test series was an Andersen Samplers, Incorporated Method 5 sampling train. The major components are described below:

1. Nozzle - Type 316 stainless steel with sharp tapered leading edge.

2. Probe - Heated glass lined probe with attached pitot tube and stack temperature thermocouple connected to a heated filter holder.

3. Andersen Samplers, Incorporated Sample Case and Control Module - as per EPA Method 5 test specifications.

Sampling Train Assembly

The sample train was assembled as follows:

1. A stainless steel nozzle was selected, sized to maintain isokinetic sampling and attached to the heated glass lined probe.

2. A preweighed filter was placed in the filter holder and its number noted on the data sheets.

3. 100 mls of deionized distilled water was placed in the first and second impinger.

4. The third impinger was assembled dry.

5. 200 grams of dry silica gel was placed in the fourth impinger.

6. The clean glassware and entire sampling train was then assembled at the sampling location.

Sampling Train Leak Check Procedures (Pre and Post)

1. The pump was started.

2. The course flow adjustment valve was opened.

3. Flow through the dry gas meter was checked.

4. The probe inlet was plugged.

5. The fine flow adjustment valve was adjusted to yield a vacuum gauge reading of 15 in Hg.

6. If the flow exceeded .02 ACFM, the pump was shut off and all connections were rechecked for tightness and the leak test procedure was repeated until acceptable results were obtained.

Pitot Tube Leak Check Procedure

1. A positive (or negative) pressure was created in the pitot line to be checked.

2. The line was then plugged to hold the pressure and the magnehelic gauge was monitored to watch for any change in the manometer fluid level.

3. If the fluid level changed, the system was rechecked for leaks and the leak check procedure was repeated until no leaks were found.

Particulate Sampling Procedure

Crushed ice was added to the impinger compartment, the nozzle was uncapped and the probe was introduced into the stack to the first sampling point. The dry gas meter reading was recorded and sampling was started. At each point, a pitot reading was made and the sampling rate was adjusted using K-Factor calculations which were based on preliminary temperature, pressure and moisture estimates. When sampling at the last point in the port was completed, the pump was turned off and the probe was carefully removed from that port.

Initially the sampling was conducted for 2.5 minutes on each of the 24 points. When the simultaneous casting operation exceeded the time required to complete the full four port sampling run of 60 minutes, sampling was continued for 2.5 minutes per traverse point while traversing the stack in reverse order. The total sampling times were 77, 82.5 and 67.5 minutes for runs 1, 2 and 3 respectively.

A final leak test was performed on the sampling train as previously described. The umbilical cord was disconnected and the sample case and probe were then disassembled.

Particulate Sample Recovery

1. The filter was removed from the heated filter holder and placed in a clean Petrie dish and labeled as Container #1.

2. A brush was used to clean the nozzle and other fittings as required. The acetone washings from the inner surfaces of the nozzle, and upstream portion of the filter holder were collected in a bottle and labeled as Container #2.

3. The contents of impinger #4 were transferred to a clean bottle to be weighed at a later time for moisture content and was labeled as Container #3.

4. The contents of impingers #1, #2, and #3 were placed in a graduated cylinder to measure the total volume of water collected.

Particulate Sample Analysis

1. Container #1 - At ARI's laboratory, the container was opened and placed in a desiccator and allowed to dry to a constant weight. Each filter and any loose matter were then weighed to the nearest 0.1 mg.

2. Container #2 - At ARI's laboratory, the contents of this container were transferred to a tared beaker and allowed to evaporate at room temperature in a fume hood. It was then placed in a desiccator and weighed on an analytical balance to the nearest 0.1 mg.

3. Container #3 - The contents of this container were transferred to a tared beaker and the weight of the silica gel was determined. The difference between this final weight and 200 grams was the total moisture collected by the silica gel.

4. The net weight gain recorded for Containers #1 and #2 were summed to yield the total solid particulates collected.

Sulfur Dioxide Determination (USEPA Method 6C)

Sulfur dioxide sampling was conducted following EPA Method 6C protocols. A Western Research Model 721 ATM Photometric SO_2 monitor was used during the testing. Results were recorded on ARI's data logger and computer system.

ARI's sampling system consisted of a heated probe with in-stack filter in each stack followed by a 3-way calibration valve connected to a heated Teflon sample line connected to a 3-way valve at ground level. The Teflon sample line was connected to an ice-cooled condenser to remove moisture followed by a Teflon lined pump. A sample manifold was connected to the exhaust side of the pump with intake lines for ARI's SO_2 and NO_x monitors.

Certified SO_2 calibration standards and zero air were used to calibrate the monitor. The gas standards were introduced directly into the three way valve at the end of the heated sample probe.

Specifically, gas standards of zero air, 491 ppm and 910 ppm SO_2 in N_2 were used for calibration. The SO_2 monitor span was set at 1000 ppm during the testing.

A pre-test and post-test measurement system bias test and calibration error test was done after each test repetition. The average zero and calibration drift values obtained during each test run on the monitor were used to correct the data for each test run.

Nitrogen Oxides Determination (USEPA Method 7E)

Continuous nitrogen oxides (as NO_2) sampling was conducted following EPA Method 7E. The NO_x monitor used was ARI's TECO Model 10 monitor. Data was recorded on ARI's data logger and computer system. Calibration gas and zero air was introduced directly into the 3-way valve for calibration of the NO_x monitor.

A converter efficiency test and response time test were conducted prior to beginning the testing following EPA Method 20 procedures.

A pre-test and post-test measurement system bias test and calibration error test were performed using certified master gas calibration standards of 57.0 ppm, 142.8 ppm and 217.7 ppm NO_x in N_2. The monitor span was set at 250 ppm. Zero and calibration drift test results were well within 3% of span for each calibration gas. The average zero and calibration drift values obtained during each test run on each monitor were used to correct the data for that test run.

Determination of Total VOC (USEPA Method 25A)

Total volatile organic compounds sampling and analysis were conducted on-site on the stack exhaust using a Ratfisch Model RS-55 Total Hydrocarbon Analyzer. The monitor was calibrated using propane as the VOC standard. The VOC concentration was converted to a C_1 basis using the factor of 3 as listed in USEPA Method 25A. The analyzer utilizes a continuous heated FID which keeps the sample gas stream above its dewpoint.

The sampling systems consisted of the following:

1) Stainless steel probe with instack filter holder.

2) 3-way calibration valve and line located at the probe.

3) Heated Teflon line (>250°F) from the probe to the analyzer.

The Ratfisch analyzer was operated at the following conditions:

Oven temperature	:	150°C
Sample backpressure	:	200 m bar
Air	:	11.5 psi
Hydrogen	:	6.0 psi
Response time	:	30 seconds
Chart speed	:	10 cm/hr
Data logger	:	15 sec. - 1 minute average
Span	:	1000 ppm propane

Zero gas and USEPA protocol 1 certified propane standards in N_2 gas standards were used for calibration of the instrument. The calibration gases were introduced at the 3-way calibration valve located at the end of each sample probe. Calibration gases used were 253.9 ppm, 467.1 ppm and 844.2 ppm propane in N_2.

Emission Calculations

The particulate, sulfur dioxide and nitrogen oxides (as NO_2) emission rates in lbs/hr were calculated for each run by multiplying the measured particulate, sulfur dioxide and nitrogen oxides concentrations (lbs/dscf) by the stack gas volumetric flow rate (dscfh).

The volatile organic compound emission rate in lbs/hr were calculated for each run by multiplying the measured VOC concentration (lbs/scf wb) by the stack gas volumetric flow rate (scfh wb).

I. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct a formal emission test program on the exhaust stack associated with the electrostatic precipitator serving the basic oxygen furnace on August 27-28, 1993.

Testing was conducted on August 27, 1993 with the fan flow rate set at 650,000 cfm on the electrostatic precipitator. As a result ofa delayed ignition condition which occurred at the beginning of the blow on the second run, a fourth run was conducted.

Testing was conducted on August 28, 1993 with the fan flow rate set at 680,000 cfm. Three sample runs were done at this condition.

Methodology

Sampling was conducted following USEPA Methods 1-5, 7E and 10 as detailed in the Code of Federal Regulations, CFR40, Part 60, 1992 and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from four 3" diameter test ports located on the stack exhaust. The test ports were located two diameters downstream and one-half diameters upstream from the last flow disturbances. The stack diameter at this location was 147.75 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 6 points on four traverses for a total of 24 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas O_2 and CO_2 Determination (USEPA Method 3A)

Continuous oxygen sampling was conducted in accordance with EPA Method 3A using ARI's OFC Infrared Industries Model IR-2000 oxygen monitor. The monitor results were recorded on a strip chart recorder and ARI's datalogger system.

ARI's sampling system consisted of a heated probe with in-stack filter followed by a 3-way calibration valve connected to a heated Teflon sample line. The Teflon sample line was connected to an ice-cooled condenser to remove moisture followed by a Teflon lined pump. A sample manifold was connected to the exhaust side of the pump with intake lines for ARI's O_2, CO_2, NO_x and CO monitors.

Certified gas standards of zero air, nitrogen and 12.1 O_2 in N_2 calibration gases were introduced at the three-way calibration valve located at the end of the sample probe for calibration of the O_2 monitor. The O_2 monitor span was set at 25% during the testing.

Continuous carbon dioxide sampling was conducted using ARI's Horiba NDIR Model 2000 carbon dioxide monitor. The monitor results were recorded on a strip chart recorder and ARI's datalogger system.

Certified gas standards of nitrogen, 8.2 and 12.9 CO_2 in N_2 calibration gases were used to calibrate the monitor. The CO_2 monitor span was set at 15% during the testing.

Stack Gas Moisture Content

Moisture sampling was conducted simultaneously with the particulate sampling in the back half of the Method 5 sampling trains per USEPA Method 4.

Total Particulate Determination (USEPA Method 5)

Particulate emission sampling was conducted using two Method 5 sampling trains in order to complete each sampling run within a specified time frame and to allow continuous sampling throughout a complete emissions cycle without sampling downtime due to sampling port changes.

Sampling was conducted for 1.5 minutes per point at each of 24 points (six points per port and four ports). The sampling rate during each run was adjusted to compensate for the changes in stack gas temperature and moisture content throughout the cycle to maintain isokinetic sampling. The sampling time for each run varied based on the duration of the cycle. The first 36 minutes consisted of initially sampling the 24 points. Backwards traversing was then performed at each point at 1½ minutes per point until the process cycle was completed.

Stack Particulate Sampling Train

The particulate sampling train used during the test series was an Andersen Samplers, Incorporated Method 5 sampling train. The major components are described below:

1. Nozzle - Type 316 stainless steel with sharp tapered leading edge.

2. Probe - Heated glass lined probe with attached pitot tube and stack temperature thermocouple connected to a heated filter holder.

3. Andersen Samplers, Incorporated Sample Case and Control Module - as per EPA Method 5 test specifications.

Sampling Train Assembly

The sample train was assembled as follows:

1. A stainless steel nozzle was selected, sized to maintain isokinetic sampling and attached to the heated glass lined probe.

2. A preweighed filter was placed in the filter holder and its number noted on the data sheets.

3. 100 mls of deionized distilled water was placed in the first and second impinger.

4. The third impinger was assembled dry.

5. 200 grams of dry silica gel was placed in the fourth impinger.

6. The clean glassware and entire sampling train was then assembled at the sampling location.

Sampling Train Leak Check Procedures (Pre and Post)

1. The pump was started.

2. The course flow adjustment valve was opened.

3. Flow through the dry gas meter was checked.

4. The probe inlet was plugged.

5. The fine flow adjustment valve was adjusted to yield a vacuum gauge reading of 15 in Hg.

6. If the flow exceeded .02 ACFM, the pump was shut off and all connections were rechecked for tightness and the leak test procedure was repeated until acceptable results were obtained.

Pitot Tube Leak Check Procedure

1. A positive (or negative) pressure was created in the pitot line to be checked.

2. The line was then plugged to hold the pressure and the magnehelic gauge was monitored to watch for any change in the manometer fluid level.

3. If the fluid level changed, the system was rechecked for leaks and the leak check procedure was repeated until no leaks were found.

Particulate Sampling Procedure

Crushed ice was added to the impinger compartment, the nozzle was uncapped and the probe was introduced into the stack to the first sampling point. The dry gas meter reading was recorded and sampling was started. At each point, a pitot reading was made and the sampling rate was adjusted using K-Factor calculations which were based on preliminary temperature, pressure and moisture estimates. When sampling at the last point in the port was completed, the pump was turned off and the probe was carefully removed from that port.

The two sampling trains were positioned at their respective port locations with the "A" train serving the South and West ports and the "B" train serving the East and North ports.

At the beginning of each cycle, sampling was started in the South port. Sampling was conducted for 1½ minutes at each of six points in the first port. At the completion of nine minutes of sampling, the second sampling train in the East port was immediately started and sampling conducted in the second port identical to the first. This process was repeated for the North and West ports with sampling and traversing continued backwards from the last sample point (24) until the cycle time was completed. Sampling was conducted continuously throughout the entire cycle.

The sampling rate during each run was adjusted to compensate for the changes in stack gas temperature and moisture content throughout the cycle to maintain isokinetic sampling rate at all times.

A final leak test was performed on the sampling train as previously described. The umbilical cord was disconnected and the sample case and probe were then disassembled.

Particulate Sample Recovery

1. The filter was removed from the heated filter holder and placed in a clean Petrie dish and labeled as Container #1.

2. A brush was used to clean the nozzle and other fittings as required. The acetone washings from the inner surfaces of the nozzle, and upstream portion of the filter holder were collected in a bottle and labeled as Container #2.

3. The contents of impinger #4 were transferred to a clean bottle to be weighed at a later time for moisture content and was labeled as Container #3.

4. The contents of impingers #1, #2, and #3 were placed in a graduated cylinder to measure the total volume of water collected.

Particulate Sample Analysis

1. Container #1 - At ARI's laboratory, the container was opened and placed in a desiccator and allowed to dry to a constant weight. Each filter and any loose matter were then weighed to the nearest 0.1 mg.

2. Container #2 - At ARI's laboratory, the contents of this container were transferred to a tared beaker and allowed to evaporate at room temperature in a fume hood. It was then placed in a desiccator and weighed on an analytical balance to the nearest 0.1 mg.

3. Container #3 - The contents of this container were transferred to a tared beaker and the weight of the silica gel was determined. The difference between this final weight and 200 grams was the total moisture collected by the silica gel.

4. The net weight gain recorded for Containers #1 and #2 were summed to yield the total solid particulates collected.

Nitrogen Oxides Determination (USEPA Method 7E)

Continuous NO_x sampling was conducted following EPA Method 7E. The NO_x monitor used was ARI's TECO Model 10 NO_x monitor. Data was recorded on a dual pen strip chart recorder and ARI's datalogger system. Calibration gas and zero was introduced directly into the 3-way valve for calibration of the NO_x monitor.

A converter efficiency test and response time test were conducted prior to beginning the testing following EPA Method 20 procedures.

A pretest and post-test measurement system bias test and calibration error test were performed using certified master gas NO_x calibration standards of 57.0 ppm, 142.8 ppm and 217.7 ppm NO_x. The NO_x monitor span was set at 250 ppm. Zero and calibration drift test results were well within 3% of span for each calibration gas. The average zero and calibration drift values obtained during each test run on each monitor were used to correct the data for that test run.

Carbon Monoxide Determination (USEPA Method 10)

Continuous carbon monoxide sampling was conducted in accordance with USEPA Method 10. A TECO Model 48 Gas Filter Correlation CO monitor was used for CO analysis. Results were recorded out on a dual pen strip chart recorder and recorded on ARI's datalogger system.

Certified CO calibration standards and zero air were used to calibrate the CO monitor. The gas standards were introduced directly into the three way valve at the end of the heated sample probe.

CO calibration standards of 5,750, 8,748 and 18,600 in N_2 were used to calibrate the CO monitor. The CO monitor span was set at 20,000 ppm during the testing.

A pretest and post-test measurement system bias test and calibration error test was done after each test repetition. The average zero and calibration drift values obtained during each test run on the monitor were used to correct the data for that test run.

Emission Calculations

The stack particulate emission rate (lbs/cycle) for each of the sampling runs was determined by summing the particulate emission rates (lbs/run) determined for each of the two sampling trains "A" and "B" used during each sampling run. This combined total represented the total stack particulate emissions for each complete BOF emissions cycle.

The total nitrogen oxides and carbon monoxide emission rates were calculated by summing the stack flow rate for each run and calculating the emission rate (lb/run) by multiplying the total flow rate (dscf/run) by the nitrogen oxides and carbon monoxide concentrations (lb/dscf).

NO_x EMISSION TEST
#12 BOILER STACK
GRANITE CITY STEEL DIVISION: GRANITE CITY, ILLINOIS

I. INTRODUCTION AND SUMMARY

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation located ~~in~~ Granite City, Illinois to conduct a nitrogen oxide emission test on the #12 Boiler exhaust stack on November 4, 1992.

The run was completed on November 4, 1992 when the boiler was operating with natural gas.

Test methods followed those as detailed in the Code of Federal Regulations, CFR40, Part 60, Appendix A; and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Testing was conducted boy Mr. M. Barton, Mr. D. Chapman and Mr. E. Kelly of ARI Environmental. Mr. Jeff Blaies of Granite City Steel was present to coordinate the tests and monitor the process conditions.

This report summarizes the test procedures and results of the test. Included, as appendices, is a documentation of all field test data, calculation summary data, strip chart data and logger data.

The results of the test are summarized below:

#12 Boiler (Natural Gas)

	Run #1
Nitrogen Oxide (as NO_2)	
Concentration, ppmv	73.7
Emission rate, lbs./hr.	32.276

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct a nitrogen oxide emission test on the #12 Boiler exhaust stack November 4, 1992.

Methodology

Sampling was conducted following USEPA Methods 1-4, 6C, 7E and 10 as detailed in the Code of Federal Regulations, CFR40, Part 60, 1991 and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from two 3" diameter test ports located on the stack exhaust. The test ports were located five diameters downstream and five diameters upstream from the last flow disturbances. The stack diameter at this location was 90.5 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 8 points on two traverses for a total of 16 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas CO_2, O_2 and N_2 Content (USEPA Method 3)

The stack gas molecular weight was determined following EPA Method 3. Gas samples were collected in a 60 liter Tedlar bag using ARI's integrated bag collection system and analyzed for CO_2, O_2 and N_2 (by difference) using a Hays Orsat type gas analyzer after each sampling run.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Stack Gas Moisture Content (USEPA Method 4)

Moisture sampling was conducted following EPA Method 4 on the exhaust stack.

Nitrogen Oxides Determination (USEPA Method 7E)

Continuous NO_x sampling was conducted following EPA Method 7E. The NO_x monitor used was ARI's TECO Model 10 NO_x monitor. Data was recorded on a pen strip chart recorder and ARI's data logger system. Calibration gas and zero air was introduced directly into the 3-way valve for calibration of the NO_x monitor.

The average zero and calibration drift values obtained during each test run on each monitor were used to correct the data for that test run.

#12 BOILER STACK
GRANITE CITY STEEL DIVISION: GRANITE CITY, ILLINOIS

I. INTRODUCTION AND SUMMARY

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation located in Granite City, Illinois to conduct a nitrogen oxide emission test program on the #12 Boiler exhaust stack on February 1, 1993.

The run was completed on February 1, 1993 with the Boiler operating with blast furnace gas.

Test methods followed those as detailed in the Code of Federal Regulations, CFR40, Part 60, Appendix A; and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Testing was conducted boy Mr. M. Ames, Mr. M. Barton, Mr. D. Chapman and Mr. J. Whitaker of ARI Environmental. Mr. Jeff Blaies of Granite City Steel was present to coordinate the tests and monitor the process conditions.

This report summarizes the test procedures and results of this test. Included, as appendices, is a documentation of all field test data, calculation summary data, strip chart data and logger data.

The results of the test are summarized below:

#12 Boiler

	Blast Furnace Gas
Nitrogen Oxide (as NO_2)	
Concentration, ppmv	15.2
Emission rate, lbs./hr.	7.373

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by the Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct a nitrogen oxide emission test on the #12 Boiler exhaust stack February 1, 1993.

Methodology

Sampling was conducted following USEPA Methods 1-4, and 7E as detailed in the Code of Federal Regulations, CFR40, Part 60, 1992 and the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from two 3" diameter test ports located on the stack exhaust. The test ports were located five diameters downstream and five diameters upstream from the last flow disturbances. The stack diameter at this location was 90.5 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 8 points on two traverses for a total of 16 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas CO_2, O_2 and N_2 Content (USEPA Method 3)

The stack gas molecular weight was determined following EPA Method 3. Gas samples were collected in a 60 liter Tedlar bag using ARI's integrated bag collection system and analyzed for CO_2, O_2 and N_2 (by difference) using a Hays Orsat type gas analyzer after each sampling run.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Stack Gas CO_2 and O_2 Determination (USEPA Method 3A)

Continuous carbon dioxide and oxygen sampling was conducted on the exhaust stack in accordance with EPA Method 3A using ARI's Horiba PIR-2000 carbon dioxide analyzer and OFC Infrared Industries Model IR-2000 oxygen monitor. The monitor's results were recorded on ARI's data logger system.

Calibration gas and zero air were introduced directly into the 3-way valve located at the end of the sample probe. The CO_2 monitor span was set at 15% and the O_2 monitor was set at 25% during the testing.

Stack Gas Moisture Content (USEPA Method 4)

Moisture sampling was conducted following EPA Method 4 on the exhaust stack.

Nitrogen Oxides Determination (USEPA Method 7E)

Continuous NO_x sampling was conducted following EPA Method 7E. The NO_x monitor used was ARI's TECO Model 10 NO_x monitor. Data was recorded on a pen strip chart recorder and ARI's data logger system. Calibration gas and zero air was introduced directly into the 3-way valve for calibration of the NO_x monitor.

The average zero and calibration drift values obtained during each test run on each monitor were used to correct the data for that test run.

NO_x EMISSION TEST
#4 SLAB FURNACE
STACK EMISSION TEST
MAY 19, 1992

Mark

Introduction and Summary of Results

On March 19, 1992 the exhaust gas from #4 Slab Furnace was tested for NO_x concentration while burning natural gas. Test Methods followed those detailed in the Code of Federal Regulations, CFR 40, Part 60, Appendix A: and the Quality Assurance Handbook for Air Pollution Measurement. System, Volume III, Stationary Source Specific Methods. The results of the test indicate an average emission rate of .393 lb. NO_x per mmbtu.

Overview

In order to determine the NO_x emissions generated during #4 Slab Furnace was fired on natural gas. Based upon the amount of fuel used during the test and the NO_x lb./hr. obtained by testing the NO_x lb./mmbtu are determined.

Test Methodology and Equipment

Sampling was conducted following USEPA Method 7E. The NO_x monitor used was AIR's TECO Model 10 NO_x monitor. Data was recorded on a dual pen strip chart recorder. Calibration gas and zero air was introduced directly into the 3-way valve for calibration of the NO_x monitor.

The average zero and calibration drift valves obtained during each test run on each monitor were used to correct the data for that test run.

Results

Average concentration of NO_x during the tests are as follows:

Run one	=	96.561 lb./hr.
Run two	=	96.256 lb./hr.
Run three	=	100.960 lb./hr.
Average	=	97.925 lb./hr.

Average fuel usage rate = 250.67 mmbtu/hr.

97.925 lb. NO_x/hr./250.67 mmbtu/hr. = 0.393 lb./mmbtu

$0.393\ lb/mmBtu \times 1019\ Btu/ft^3 = 401\ lb/mmFt^3$

II. TESTING AND ANALYTICAL PROCEDURES

Overview

ARI Environmental, Inc. was retained by Granite City Steel Division of the National Steel Corporation in Granite City, Illinois to conduct a sulfur dioxide, nitrogen oxide and carbon monoxide test program on the #4 Slab Furnace exhaust stack on March 19, 1992.

Methodology

Sampling was conducted following USEPA Method 1-4, 6C, 7E and 10 as detailed in the Code of Federal Regulations CFR40, Part 60, 1991 and Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods.

Sample Location (USEPA Method 1)

Samples were taken from four 3" diameter test ports located on the stack exhaust. The test ports were located three diameters downstream and three diameters upstream from the last flow disturbances. The stack diameter at this location was 180 inches.

Gas Flow and Temperature (USEPA Method 2)

Velocity and volume flow was determined following USEPA Method 2. Velocity and temperature readings were taken on each of 4 points on four traverses for a total of 16 points.

Velocity traverses in the stack were made with a type "S" pitot tube. The velocity head was read on a Dwyer inclined vertical manometer to the nearest 0.01 in H_2O. Temperature measurements in the stack were made with a Chromel-Alumel thermocouple and connected to an Omega Model 170 digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Temperature measurements were determined using a Chromel-Alumel thermocouple connected to an Omega digital direct read-out potentiometer accurate to approximately 1% of the absolute stack temperature.

Stack Gas CO_2, O_2 and N_2 Content (USEPA Method 3)

The stack gas molecular weight was determined following EPA Method 3. Gas samples were collected in a 60 liter Tedlar bag using ARI's integrated bag collection system and analyzed for CO_2, O_2 and N_2 (by difference) using a Hays Orsat type gas analyzer after each sampling run.

SR 2440

Stack Gas Moisture Content (USEPA Method 4)

Moisture sampling was conducted following EPA Method 4 on the exhaust stack.

Sulfur Dioxide Determination - Instrument Method (USEPA Method 6C)

Sulfur dioxide sampling and analyses were performed ~~on~~ a one-hour continuous basis in accordance with USPEA Method 6C.

A Western Research Model 5R UV monitor was used for the testing zero air and calibration gases were introduced into the 3 way calibration valve located at the end of the heated sample probe.

Nitrogen Oxides Determination (USEPA Method 7E)

Continuous NO_x sampling was conducted following EPA Method 7E. The NO_x monitor used was ARI's TECO Model 10 NO_x monitor. Data was recorded on a dual pen strip chart recorder. Calibration gas and zero was introduced directly into the 3-way valve for calibration of the NO_x monitor.

Carbon Monoxide Determination (USPEA Method 10)

Carbon monoxide sampling and analyses were conducted continuously in accordance with USPEA Method 10. A TECO Model 48 Gas Filter Correlation CO monitor was used for CO analysis. Results were printed out on a dual pen strip chart recorder.

Certified CO calibration standards and zero air were used to calibrate the CO monitor which were introduced directly into the three way valve at the end of the heated sample probe.

APPENDIX C
EMISSION FACTOR CALCULATION
BOF ROOF MONITOR (Emissions Source 0034)

Base Period Emission Factor

Uncontrolled, at source, PM emission factors per AP-42 and AIRS:

- charge = 0.6 lbs PM / ton hot metal at BOF
- refine = 28.5 lbs PM / ton steel at BOF
- tap = 0.92 lbs PM / ton steel at BOF
- PM_{10}/TSP ratio = 0.67 (Table 7.5-2 AP-42, Top Blown Furnace)

Production in tons per year:

Iron = 2,059,557 Steel = 2,413,406

PM_{10} from BOF roof:

Process Step	*Base Period Actual Emissions (tons/year)*	*Base Period Actual Emissions (lbs/hr)*	*Emission Rate (lbs/ton steel)*	*Assumed Hood Capture Efficiency (%)*
Charge	41.4	9.45	0.3431	90
Refine	239,4	52.61	0.19095	99
Tap	74.4	16.98	0.06164	90
Total	346.2	79.04	0.2869	

(346.2 tpy * 2000lb/ton)/2,413,406tons steel = 0.2869 lb PM_{10}/ton steel

Emission Factor with Production Increase

Many improvements have been made to the BOF ESP control system since it was originally installed. These improvements include but are not limited to secondary emission hoods and doghouse enclosures, steam injection, air/water lances for moisture control and electronic voltage controllers for the ESP. A fume suppression system was installed in April, 1992 for additional control of tapping emissions.

Granite City has employed the use of formal problem-solving techniques as part of an ongoing effort to optimize the performance of the ESP system. The following are some of the improvements which have been implemented or will be implemented:

- 4th Quarter 1993 - #1 field wire replacement
- January 1995 - #2 field wire replacement
- July 1996 - #3 and #4 field wire replacement
- March 1995 - installed double dump valves on all ESP hoppers
- 3rd Quarter 1995 - replaced Automatic Voltage Controllers for all ESPs
- 2nd Quarter 1995 - replaced inefficient transformer rectifiers
- 3rd Quarter 1995 - replaced rubber boots on top of ESP to minimize water and air infiltration
- 2nd Quarter 1995 - replaced transition pieces at top of evaporation chambers
- 2nd Quarter 1995 - repaired downcomer and ductwork air leaks
- January 1995 - relocated steam injection to downcomer

In addition to all of these improvements, in June of 1995, a forth ESP was added at a cost of approximately $7,000,000. This addition to the existing ESP control system is intended to ensure compliance at the increased production rates proposed in this application.

Figure C-1 at the end of this Appendix shows the BOF gas cleaning system as it will be for the increased production rate.

The roof monitor emission rate that will be achieved at the increased production rate is shown below.

Uncontrolled, at source, PM emission factors per AP-42 and AIRS:

- charge = 0.6 lbs PM / ton hot metal at BOF
- refine = 28.5 lbs PM / ton steel at BOF
- tap = 0.92 lbs PM / ton steel at BOF
- PM_{10}/TSP ratio = 0.67 (Table 7.5-2 AP-42, Top Blown Furnace)

Production in tons per year:

Iron = 3,165,000 Steel = 3,580,000

PM_{10} from BOF roof:

Process Step	*Production Increase Emissions (tons/year)*	*Production Increase Emissions (lbs/hr)*	*Emission Rate-- (lbs/ton steel)*	*Assumed Hood Capture Efficiency (%)*
Charge	31.8	7.26	0.01777	95 **
Refine	34.2	7.8	0.019095	99.9 **
Tap	52.4	11.97	0.029279	95 **
Total	118.4	27.03	0.066145	

(118.4 tpy * 2000lb/ton)/3,580,000tons steel = 0. 066145lb PM_{10}/ton steel

** Increased capture and control efficiency due to installation of 4th ESP and system improvements

REMOVAL OF BLAST FURNACE SLAG SPOUT HOOD - JANUARY, 1990

Based on May 8, 1989 submittal for modification of operating permit for "A" & "B" Blast Furnaces. +4.9 TPY

2 CASTER PRODUCTION - DECEMBER 1, 1990

Summary of Project Emission Changes (tons/yr)[1] (Assuming all steel produced is continuous cast.)

Argon Stirring and Baghouse	4.85
Tundish with Shrouds	--
Powder Addition	7.49
Slab Casting	2.01
Slab Cut-off	9.03
Slab Ripping with Baghouse	2.58
	26.0 tons/yr PM_{10}
Caster #1 Actual	14.3 tons/yr PM_{10}

Caster #2 PM_{10} emissions = 26.0 - 14.3 = 11.7 tons/yr

INGOT TEEMING SHUTDOWN - APRIL 1, 1991

670,000 tons / year X 0.067 lbs / ton = 22.4 tons / year PM_{10} reduction

[1] Reference - March 16, 1988 IEPA "Project Summary for Proposed Issuance of an Air Pollution Control Construction Permit for Continuous Caster".

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

REMOVAL OF BLAST FURNACE SLAG SPOUT HOOD - JANUARY, 1990

Based on May 8, 1989 submittal for modification of operating permit for "A" & "B" Blast Furnaces. +4.9 TPY

2 CASTER PRODUCTION - DECEMBER 1, 1990

Summary of Project Emission Changes (tons/yr)[1] (Assuming all steel produced is continuous cast.)

Argon Stirring and Baghouse	4.85

SHUTDOWN BLOOMING MILL - APRIL 1, 1991

Coke oven gas consumed at Soaking Pits, 1,076,926 MMBtu in 1990.

The coke oven gas which was consumed at the Blooming Mill Soaking Pits (firing rate 408 MMBtu/hr/furnace) is to be used at the Hot Strip Slab Furnaces (1 - 3) (firing rate 321.8 MMBtu/hr/furnace) and #4 slab furnace (firing rate 495 MMBtu/hr).

The emission reductions for the displaced use of natural gas on the slab reheat furnaces is based on the AIRS 1990 emission factor for natural gas sources greater than 100 MMBtu/hr and the "ACT for NO_X Emissions from Iron and Steel Mills".

1990

Coke Oven Gas Soaking Pits - General < 10 MMBtu/hr

44,131 X 0.003 X 1/2000 = 0.066 tpy PM_{10} emission reduction

44,131 X 0.0006 X 1/2000 = 0.013 tpy SO_2 emission reduction

44,131 X 0.10 X 1/2000 = 2.21 tpy NO_X emission reduction

44,131 X 0.0053 X 1/2000 = 0.12 tpy VOC emission reduction

44,131 X 0.02 X 1/2000 = 0.44 tpy CO emission reduction

Natural Gas Blooming Mill < 10 MMBtu/hr

18,083 X 0.003 X 1/2000 = 0.027 tpy PM_{10} emission reduction

18,083 X 0.0006 X 1/2000 = 0.005 tpy SO_2 emission reduction

18,083 X 0.10 X 1/2000 = 0.90 tpy NO_X emission reduction

18,803 X 0.0053 X 1/2000 = 0.05 tpy VOC emission reduction

18,803 X 0.02 X 1/2000 = 0.18 tpy CO emission reduction

INSTALLATION OF NESHAP CONTROLS AT COKE BY-PRODUCT PLANT

VOC Emissions Reduction at Coke By-Product Plant after Installation of NESHAPS Controls

It was reported, in Attachment 2 of the October 8, 1991 submittal of additional information in application for modification of Operating Permits for the Granite City Division Emission Reduction Plant Production Increase Project, that the installation of benzene emission controls (NESHAPS) at the Coke By-Product Recovery Plant would provide a reduction of 31.6 TPY VOC other than benzene. The following is a demonstration of the derivation of that VOC emission reduction.

All calculations are based on 1990 coke production of 577,473 tons.

Emission factors are taken from the publication EPA-450/3-83-016a, "Benzene Emissions from Coke By-Product Recovery Plants - Background Information for Proposed Standards." The NESHAPS emission factors contained in this publication are for benzene only. The emissions of other light oil (L.O.) constituents were calculated by taking the ratio of the mole fraction of each L.O. constituent (liquid) times the vapor pressure of that constituent to the mole fraction of benzene (liquid) times the vapor pressure of benzene, then multiplying that ration by the calculated benzene emissions. It is assumed that all emissions are vapors and that the vapors are in equilibrium with the liquid light oil.

Sample calculation:

For the direct water cooling tower, benzene emissions are calculated as follows:

$$(577{,}473 \text{ tons coke}) \times \frac{2000 \text{ lb.}}{\text{ton}} \times \frac{454 \text{g}}{\text{lb.}} \times \frac{1 \text{ Mg}}{10^6 \text{g}} = 524{,}346 \text{ Mg coke}$$

$$\frac{524{,}346 \text{ Mg coke}}{\text{yr.}} \times \frac{270 \text{g}}{\text{Mg}} \times \frac{1 \text{ lb.}}{454 \text{g}} = 311{,}836 \text{ lb./year}$$

where 270g/Mg = uncontrolled benzene emission factor from Table 3 - 7, attached.

From the Light Oil Constituents table, attached,

Benzene: $y(P^*) = .71(96) = 68.16$

where .71 = benzene mole fraction
and 96 = benzene vapor pressure

Similarly,

Toluene: $y(P^*) = .159(30) = 4.77$

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Hence, the toluene emissions, with no controls, from the direct water cooling tower are

$$\frac{4.77}{68.16} \text{ (311,836 lb/yr.)} = 21{,}823 \text{ lb. toluene/year}$$

Toluene emissions after installation of NESHAPS controls with 100% efficiency are

21,823 lb. toluene (100 - 100) = 0 lb. toluene/yr.

Emission of benzene, toluene, xylene, ethylbenzene and styrene are calculated, as above, for the various emission sources at the By-Product Plant and presented in the table Emissions of Light Oil Constituents after Installation of NESHAPS Controls at the Coke Oven By-Products Plant, attached.

The non-benzene emissions controlled by the NESHAPS project are then calculated, for each light oil constituent considered, by subtracting the total emissions after controls were applied at all sources from the total emissions prior to application of controls at all sources. These calculations are presented in the table entitled Non-Benzene Emissions Controlled by NESHAPS Project, attached.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Non-Benzene Emissions Controlled by NESHAPS Project

	Total Uncontrolled Emissions		Total Uncontrolled Emissions after NESHAPS Controls Installed					
Toluene	59,584	-	997	=	58,587 lbs.	x $\frac{1T}{2000}$	=	29.3 tons/yr.
Xylene	2,871	-	48	=	2,823 lbs.	x $\frac{1T}{2000}$	=	1.4 tons/yr.
Ethylbenzene	959	-	10	=	949 lbs.	x $\frac{1T}{2000}$	=	0.5 tons/yr.
Styrene	868	-	9	=	859 lbs.	x $\frac{1T}{2000}$	=	0.4 tons/yr.
								31.6 tons/yr.

APPENDIX F

FUGITIVE PARTICULATE EMISSIONS

EMISSION CALCULATIONS

Fugitive particulate emissions from paved and unpaved roads were calculated based on information provided in "Granite City Area PM-10 Emission Inventory", MRI Final Report, 1988, and the 1991 PM_{10} SIP developed by the Illinois Environmental Protection Agency.

Based on information in these sources, fugitive particulate inventories were developed for three scenarios:

- Initial Uncontrolled Emissions - These are uncontrolled emission estimates taken from the 1988 MRI report.
- Projected Initial Uncontrolled Emissions - These emission estimates reflect uncontrolled emissions reported in the 1988 MRI document scaled up by a factor related to the requested production increase. That factor is derived by dividing the requested production level by the base period production level. The factor applied is dependent on the potential increase in activity on each specific road segment. A factor of one was used for those areas where activity is not a function of production level. A factor of 1.1 was used in those areas where some increase in activity may occur, but that increase is expected to be minor.
- Projected Controlled Emissions - These estimates start with the Projected Initial Uncontrolled Emissions and are then reduced to reflect the fugitive emission control program that will be in effect with the production increase.

EMISSION CONTROL PROGRAM

Table F-1 presents intitial uncontrolled, projected uncontrolled, and projected controlled emissions.

Projected controlled emissions reflect an extensive fugitive dust control program. As a part of this application, Granite City Steel is committing to a fugitive emission control program that adds to the commitments that were implemented earlier. The resulting control program is outlined below in **Table F-2.**

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

MATERIALS HANDLING

Uncontrolled and controlled emissions from materials handling activities that will be affected by the production increase were estimated using the same sources previously cited. These estimates are presented in **Table F-3**.

SUMMARY

Fugitive emissions ard credits are summarized on **Table F-4**.

Dear Mr. Pelan:

Enclosed please find a diskette (5 1/4") containing a file (GCSSCRS0.INP) with the ISCST input information for Granite City Steel. The PSD inventory you requested will be forwarded to you at a later date. If you have further needs or questions, please feel free to contact me at (217)524-4788.

Sincerely,

Michael T. Reischel

Overland Park, Kansas 66211

Dear Mr. Pelan:

Enclosed please find three diskettes (5 1/4") containing the files you requested. Please return the diskettes after you have copied the data. The diskettes contain the following data:

a) five meteorological data files (for 1982-86) that use St. Louis for surface data and Salem for upper air data

b) three receptor grid files of varying resolution and coverage. These grids were used for SIP related modeling.

It is our recommendation that the PSD modeling should use the above years (1982-1986) of meteorological data for consistency with the SIP modeling.

I have enclosed a cross reference listing of our source I.D. numbers with corresponding emission unit names for your convenience. If you have any questions regarding PSD inventory or sources please contact Mr. Chris Romaine of our Permits Section at (217)785-1715. If you have further needs or questions, please feel free to contact me at (217)524-4788.

Sincerely,

Michael T. Reischel

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
Research Triangle Park, NC 27711

OFFICE OF
AIR QUALITY PLANNING AND
STANDARDS

September 14, 2022

Mr. Chris Hardin
Manager of Environmental Affairs
U.S. Steel
Penn Liberty Plaza 1
1350 Penn Avenue, Suite 200
Pittsburgh, Pennsylvania 15222-4211

Re: Revision of Request to Provide Information Pursuant to the Clean Air Act (CAA)

Dear Mr. Hardin:

The U.S. Environmental Protection Agency (EPA) is requiring U.S. Steel to submit certain information about its Granite City (IL) facility located at 1951 State Street, Granite City, Illinois 62040. As you know, we issued a Clean Air Act (CAA) section 114 information request on January 31, 2022. With today's correspondence, we are requesting additional source testing related to the January 31, 2022, CAA section 114 information request. As noted in our previous request, we are collecting information and data to support the development of mandatory amendments for National Emission Standards for Hazardous Air Pollutants (NESHAP) for Integrated Iron and Steel Manufacturing Facilities, 40 CFR part 63, subpart FFFFF.

Other than noted below, all aspects of our request for source testing sent on January 31, 2022 (*i.e.*, Enclosures 1 and 3 through 8), remain unchanged, including submittal and handling of confidential business information (CBI) and the requirement for a site-specific test plan.

The changes to Enclosure 2 are specified in revised Table 1a, Table 2a, and Table 3a (refer to Attachment 1). These tables supersede Table 1, Table 2, and Table 3, respectively, in the January 31, 2022, submittal. A new Table 4 is added to Enclosure 2. We ask that you complete the revised Enclosure 2, source testing and send the requested test data and upload the associated files, as appropriate, to the Electronic Reporting Tool (ERT) for the following emission sources at your Granite City (IL) facility:

Sources	**Test Method**
Basic oxygen process furnace (BOPF) primary control device	Method 26A
Blast furnace (BF) stove - at the outlet of the boiler BOPF primary control device	Other Test Method 46

The schedule for these requests is as follows:

Information that Must be Submitted	Deadline for Submittal of Information
Explanations of testing problems	30 days after receipt of revised section 114 request
Test data (including all test data)	January 6, 2023

U.S. Steel must submit all required information under an authorized signature with the following certification:

> I certify under penalty of law that I have examined and am familiar with the information in the enclosed documents, including all attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are, to the best of my knowledge and belief, true and complete. I am aware that there are significant penalties for knowingly submitting false statements and information, including the possibility of fines or imprisonment pursuant to section 113(c)(2) of the Clean Air Act and 18 U.S.C. §§ 1001 and 1341.

All required non-CBI information should be submitted by U.S. Steel to:

> Mr. Phil Mulrine
> Office of Air Quality Planning and Standards
> Sector Policies and Programs Division
> Research Triangle Park, North Carolina 27711
> *mulrine.phil@epa.gov*

We are issuing this information request pursuant to section 114(a) of the CAA, 42 U.S.C. § 7414(a). Section 114(a) authorizes the Administrator of the EPA to require the submission of information. This authority has been delegated to the Director of the Sector Policies and Programs Division. This information request is not subject to the Paperwork Reduction Act, 44 U.S.C. § 3501 et seq., because it seeks collection of information from specific individuals or entities as part of an administrative action or investigation. We may use any information submitted in response to this request in an administrative, civil, or criminal action. Failure to comply fully with this information request may subject U.S. Steel to an enforcement action under section 113 of the CAA, 42 U.S.C. § 7413.

Thank you for your assistance in this effort. Your response will provide comprehensive information about the integrated iron and steel source category, which will lead to a more effective

rulemaking. Any questions about this information request should be directed to Phil Mulrine in the EPA's Sector Policies and Programs Division by email at *mulrine.phil@epa.gov* or by telephone at (919) 541-5289.

Sincerely,

PENNY LASSITER

Attachment 1

Table 1a: Summary of Required Air Emissions Testing for Integrated Iron and Steel

Note: All revisions to the Section 114 request are shown in red font in the following tables.

Pollutant	Test Method	Sources	Facilities
Lead, Arsenic, and Chromium	40 CFR Part 50, Appendix B	Fenceline as described in Section 1.3	Gary (IN); Granite City (IL)
Hydrogen fluoride (HF)	Method 26A	Sinter plant windboxes	Gary (IN) (1 of the 2 windboxes)
HAP Metals	Method 29	Sinter plant windboxes	Gary (IN) (1 of the 2 windboxes)
HAP Metals	Method 29	Any of the following sources **for which the data submitted in 2011 are no longer representative of current emissions**: • Blast furnace (BF) control device (not BF with fume suppressants) • BOPF primary control device • BOPF secondary control device	All/Any
Opacity	Method 9	Any of the following sources for which there are no previous data available (post 2015): • BF bleeder valve planned openings • BF casthouse fugitives • Beaching of iron from BFs • BOPF shop fugitives • BF and BOPF shop slag processing, handling, and storage[1]	All/Any
Visible Emissions	Method 22 (as alternative to Method 9)	BF bell leaks for which there are no previous data available (post 2015)	All/Any

[1] Processing operations include, but are not limited to, crushing, grinding, screening, and sizing. Handling and storage events include, but are not limited to: slag flowing in the runners; slag dropping into a slag container (if applicable); slag dropping into the pit; slag flowing and cooling in the pit; end-loader digging and dumping; in-plant truck dumping; use of conveyors, stackers, and reclaimers; storage piles; and loadout for shipping slag offsite, if applicable.

Pollutant	Test Method	Sources	Facilities
Dioxins and furans (D/F)	Other Test Method 46	BF stove - at the outlet of the boiler BOPF primary control device	Granite City (IL)
Hydrochloric acid (HCl)	Method 26A	BOPF primary control device	Granite City (IL)

Table 2a: Summary of Required Test Methods for Integrated Iron and Steel Manufacturing Air Pollution Sources

Pollutant	Required Method	Minimum No. of Test Runs and Duration by Source, where Appropriate	Units of Measure
Hydrogen fluoride (7664-39-3)	EPA Method 26A	Perform at least seven (7) test runs while the process and control devices are operating under representative conditions. Follow the procedures of 40 CFR §63.7822(c) and (d) to determine emissions. Collect a minimum sample volume of 70 dscf (2 dscm) of gas during each run.[2] You should not dilute samples prior to analysis. If samples are diluted prior to analysis and the results are non-detect, you must reanalyze the sample undiluted and report that value. Both the acidic and the basic impingers must be analyzed for fluoride.	lb/hr lb/ton of sinter,

[2] Previous tests that collected the sample volume required at that time or according to another listed method (if less than the current test requirements) are acceptable as long as all analytes are measured at levels twice the method detection limit.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Pollutant	Required Method	Minimum No. of Test Runs and Duration by Source, where Appropriate	Units of Measure
HAP Metals: Antimony (7440-36-0) Arsenic (7440-38-2) Beryllium (7440-41-7) Cadmium (7440-43-9) Chromium (7440-47-3) Cobalt (7440-48-4) Lead (7439-92-1) Manganese (7439-96-5) Mercury (7439-97-6) Nickel (7440-02-0) Selenium (7782-49-2)	EPA Method 29 Use cold vapor atomic absorption spectroscopy (CVAAS) for mercury and inductively coupled (argon) plasma with mass spectrometry (IC(A)P/MS) for all other HAP metals in Method 29. Report all metals results.	Perform at least three test runs while the process and control device are operating under representative conditions. For BOPF tests, this includes at least one full production cycle (from scrap charge to 3 minutes after slag is emptied from the vessel) for each run.[3] Follow the procedures of 40 CFR §63.7822(c) through (g) to determine emissions except the minimum sample time is determined by the target volume below. Collect a minimum sample volume of 105 dscf (3 dscm) of gas during each test run.[2,3]	gr/dscf lb/hr lb/ton of sinter, hot iron, or cast steel product, as appropriate
Opacity	EPA Method 9	Over the next 2 months from the email date of this letter: **For dirty gas bleeder valve planned openings**: conduct opacity observations in accordance with Method 9 (six-minute averages) as soon as event begins until the opacity reaches ten percent opacity or less for three minutes for three planned openings during the two month period following the email date of this letter and allowing five business days to set-up the program, if the planned opening occurs Monday – Friday 7:00 am – 3:00 pm, excluding holidays, when the	Percent (%)

[3] Except for BOPF with closed hood systems, where sampling should be performed only during the primary oxygen blow and only for 20 heat cycles or the collection of 105 dscf (3 dscm) sample volume, whichever is less.

Electronic Filing: Received, Clerk's Office 06/12/2024 **PCB 2024-077

Pollutant	Required Method	Minimum No. of Test Runs and Duration by Source, where Appropriate	Units of Measure
		facility knows or has reason to know that a dirty gas bleeder valve planned opening will occur at least two hours in advance of the initiation of the planned opening. **For BF casthouse fugitives:** conduct opacity observations in accordance with Method 9 (six-minute averages) with observations made in accordance with 40 CFR Subpart FFFFF Integrated Iron and Steel MACT during casting. Casting begins when the furnace taphole is opened, usually by creating a hole near the bottom of the furnace and ends when the hole is plugged. At least three cast cycles must be tested. The number of casthouse openings may be minimized by closing unnecessary openings for the duration of the test but is not required. **For basic oxygen process furnace (BOPF) shop fugitives**: conduct opacity observations in accordance with Method 9 (three-minute averages) with observations made in accordance with 40 CFR Subpart FFFFF Integrated Iron and Steel MACT during the entire steel production cycle and including at least three cycles. The steel production cycle begins when scrap is charged to the furnace and ends three minutes after the slag is emptied from the vessel into the slag pot. The number of openings may be minimized by closing unnecessary openings for the duration of the test but is not required. **For beaching of iron from BFs**: conduct opacity observations in accordance with Method 9 (six-minute block averages) for three beaching events from the initiation of beaching until beaching ends, if beaching occurs Monday – Friday 7:00 am – 3:00 pm, excluding holidays. **For BOPF shop slag processing, handling, and storage operations:** for the part of the emissions plume that has the highest visible

Pollutant	Required Method	Minimum No. of Test Runs and Duration by Source, where Appropriate	Units of Measure
		emissions, as determined in Enclosure 1 Part III Section G Question 2c, take six-minute averages with observations made when visible emissions are the highest. At each operating piece of equipment handing slag (i.e., screener, crusher, and sizer) perform opacity tests for at least two hours of readings consisting of at least 30 minutes on four different days including at least 2 days where there has been no precipitation in the preceding 48 hours. A minimum of one hour of readings should be taken from each of the following: slag dumping to a pile, digging from a pile, and dumping to stationary equipment. If multiple pieces of equipment are identical in operation and design, only a single piece of equipment may be tested. Please provide sufficient information to determine that the pieces of equipment are identical. Equipment should not be started just to collect emissions data.	
Visible Emissions	Method 22	**For blast furnace (BF) bell leaks**: Perform a minimum of three thirty-minute duration tests at a BF top with a small bell.	
D/F	Other Test Method 46	Perform at least three valid test runs while the process and control devices are operating under representative conditions. For BOPF tests, this includes at least one full production cycle (from scrap charge to 3 minutes after slag is emptied from the vessel) for each run.[4] Follow the procedures of 40 CFR §63.7822(c) and (d) to determine emissions. Collect a minimum sample volume of 105 dscf (3 dscm) of gas during each test run. Use high resolution mass spectrometry for sample analysis.[5,6]	ng/dscm and ng/dscm corrected to 7% O_2 and lb/hr for each D/F congener, and total D/Fs

[4] Except for BOPF with closed hood systems, where sampling should be performed only during the primary oxygen blow and only for 20 heat cycles or the collection of 105 dscf (3 dscm) sample volume, whichever is less.

[5] Congener list from OTM-46 shown in Table 4.

[6] OTM-46 incorporates revisions to U.S. EPA Method 23 that were proposed on January 14, 2020, and are expected to be promulgated prior to the testing required by this Section 114 request. Method available at: https://www.epa.gov/system/files/documents/2022-01/otm-46-method-01282022.pdf.

Pollutant	Required Method	Minimum No. of Test Runs and Duration by Source, where Appropriate	Units of Measure
Hydrochloric acid (HCl)	Method 26A	Perform at least three valid test runs while the process and control devices are operating under representative conditions. Follow the procedures of 40 CFR §63.7822(c) and (d) to determine emissions. Collect a minimum sample volume of 70 dscf (2 dscm) of gas during each run.[7] You should not dilute samples prior to analysis. If samples are diluted prior to analysis and the results are non-detect, you must reanalyze the sample undiluted and report that value.	mg/dscm, and lb/ton of hot iron, or cast steel product, as appropriate

[7] Previous tests that collected the sample volume required at that time or according to another listed method (if less than the current test requirements) are acceptable as long as all analytes are measured at levels twice the method detection limit.
