EXECUTIVE SUMMARY

This report presents the results of the Phase II Environmental Site Assessment (Phase II ESA) conducted by ENSR Corporation (ENSR) in October 1998 at the Commonwealth Edison Company (ComEd) Will County Generating Station, located at 529 East Romeo Road in Romeoville, Illinois. Phase II ESA activities consisted of advancement of soil borings, installation of monitoring wells, and collection of surface and subsurface soil, sediment, and groundwater samples. The purpose of the Phase II ESA was to investigate the potential presence of contamination in the areas of environmental concern identified in the Phase I Environmental Site Assessment (Phase I ESA).

Based on the results of the Phase I ESA, 15 potential areas of concern were identified for further investigation. These areas of concern are identified in **Section 2.0**. Each of these areas of concern were investigated during the Phase II ESA activities. Eighteen soil borings were advanced and 5 monitoring wells were installed. Soil samples were collected from the borings and groundwater samples were collected from the monitoring wells. In addition, 23 surface soil samples and 14 sediment samples were collected at the facility.

These samples were submitted for analysis of benzene, toluene, ethyl benzene, and total xylenes (BTEX) using EPA Method 8260; polynuclear aromatic hydrocarbons (PNAs) using EPA Method 8310; polychlorinated biphenyls (PCBs) using EPA Method 8081; Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method series 6000 and 7000; and pH using EPA Method 9045.

In addition, the surface soil samples and sediment samples were also submitted for analysis of total petroleum hydrocarbons (TPH) using EPA Method 8015. Water quality field parameters, consisting of pH, specific conductivity, and temperature, were also recorded from the groundwater samples collected.

PNA constituents were detected above the Illinois Environmental Protection Agency (IEPA) cleanup objectives primarily in the surface soil samples collected at the facility. These surface soil samples were collected directly from a "stained" location in the identified potential areas of concern. Therefore, it was determined that the impact from these PNA constituents is relatively localized. However, PNA constituents were detected in soil samples collected from borings at approximately 3 feet below grade.

Arsenic was detected above the IEPA cleanup objective of 3 milligrams per kilogram (mg/kg) in samples collected throughout the facility. However, the concentrations of arsenic are within the range of arsenic detected by the EPA during a state wide soil survey in 1992. Lead was detected above the IEPA cleanup objective of 400 mg/kg in the sediment sample collected from the northern coal pile runoff pond, and in the surface soil samples collected from the surge hopper, areas surrounding the chimneys/precipitators, and stained transformers. In addition, chromium was detected above the IEPA cleanup objective of 420 mg/kg in the sediment sample collected from the northern coal pile runoff pond.

PCBs were detected above the IEPA cleanup objective of 1 mg/kg in samples collected from stained transformers, ash disposal area, coal handling area, and materials storage areas on the west side of the main building. The PCBs were only detected in the first 3 feet of soil.

It should be noted that TPH was detected throughout the site. Although a cleanup objective has not been established by the IEPA, TPH was detected at elevated concentrations (greater than 1,000 mg/kg) and would indicate impact by petroleum hydrocarbon compounds.

Based on the relatively low volatility of the constituents of concern detected above the IEPA cleanup objectives, the soil inhalation exposure pathway is not a likely contaminant exposure pathway. In addition, based on the facility's location immediately adjacent to two bodies of water, it is unlikely that the impacted groundwater beneath the facility would have any impact on these wells. Therefore, the groundwater ingestion is not a potential contaminant exposure pathway. However, emulsified oil droplets and an oil sheen were encountered during groundwater sampling activities in the vicinity of the ignition fuel and diesel fuel aboveground storage tanks (ASTs) located to the south of the coal pile.

The soil ingestion pathway is a potential exposure pathway during construction activities. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

Based on the current land use (industrial) and site conditions (analytical results and near surface bedrock), it is judged that the potential for human exposure to the constituents of concern from this facility is low. It should be noted that there is no requirement under Illinois environmental law to further investigate or remediate this property.

1.0 INTRODUCTION

1.1 General

ENSR Corporation (ENSR) was retained by Commonwealth Edison Company (ComEd) to conduct Phase II Environmental Site Assessment (Phase II ESA) activities on a "limited" portion of the 216 acre Will County Generating Station, located at 529 East Romeo Road in Romeoville, Illinois (**Figure 1, Site Location Map**).

The scope of the Phase II ESA activities were based on the preliminary results of the Phase I Environmental Site Assessment (Phase I ESA), with concurrence between ENSR and ComEd. Phase II ESA activities were conducted from October 15 to October 26, 1998, and included advancement of soil borings, installation of monitoring wells, and collection of surface and subsurface soil, sediment, and groundwater samples. **Figure 2** illustrates the layout of the facility.

1.2 Objectives and Scope

The purpose of the Phase II ESA was to investigate the potential presence of contamination in the areas of environmental concern identified in the Phase I ESA. The Phase II ESA adequately assessed the surface and/or subsurface conditions in the locations where sampling was conducted. The Phase II ESA is a tool for developing a conceptual site model to identify the presence and nature of potential contamination, describe potential contaminant migration pathways, and define potential exposure pathways in sampled areas. Based upon this and the information gathered during the Phase II ESA, and using the Illinois Environmental Protection Agency (IEPA) Tiered Approach to Cleanup Objectives (TACO) as guidance, it can be determined whether remediation is warranted in the locations sampled. The Phase II ESA alone is not an exhaustive investigation which can be used to determine the extent of contamination, nor the cost of any suggested remediation.

The objective of the Phase II ESA was to develop a conceptual site model to identify the presence and nature of potential contamination, describe potential contaminant migration pathways, and define potential exposure pathways. To meet this objective, ENSR implemented a "phased" assessment designed to provide increasing levels of information based upon obtained data. Recognizing that existing information for the facility and potential contamination was limited, the principal tasks completed during the Phase II ESA included the following:

- Soil boring advancement and soil sample collection;
- Monitoring well installation and groundwater sample collection;
- Collection of surface soil and sediment samples;
- Laboratory analysis of samples; and,
- Evaluation of analytical results and comparison to the IEPA Tier 1 Industrial/Commercial Soil Cleanup Objectives and IEPA Tier 1 Groundwater Cleanup Objectives.

The investigation consisted of the advancement of 18 soil borings and the installation of 5 monitoring wells at the potential areas of concern identified during the Phase I ESA. Soil samples were collected from the borings and groundwater samples were collected from the monitoring wells. These samples were submitted for analysis of benzene, toluene, ethyl benzene, and total xylenes (BTEX) using EPA Method 8260, polynuclear aromatic hydrocarbons (PNAs) using EPA Method 8310, polychlorinated biphenyls (PCBs) using EPA Method 8081, Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method series 6000 and 7000, and pH by EPA Method 9045. Water quality field parameters, consisting of pH, specific conductivity, and temperature, were also recorded from the groundwater samples collected.

In addition, 23 surface soil samples were collected from the identified potential areas of concern and 14 sediment samples were collected from selected ash/coal settling ponds or drainage ditches located at the facility. These samples were submitted for analysis of the previously referenced constituents as well as total petroleum hydrocarbons (TPH) using EPA Method 8015.

1.3 Report Organization

Section 1 introduces the principal subjects covered in this report, describes the purpose and scope of the Phase II ESA, and presents limitations of the Phase II ESA. **Section 2** provides information regarding the identified potential areas of concern and the methodologies used during the investigation. **Section 3** presents the results of the Phase II ESA. **Section 4** presents the data assessment of the Phase II ESA. **Tables** summarizing the analytical results and **Figures** illustrating the facility location and layout, as well as sampling locations, have been included under the appropriate headings.

Appendix A contains laboratory analytical reports. **Appendix B** contains boring logs and monitoring well construction diagrams. **Appendix C** contains monitoring well gauging and survey data.

1.4 Limitations

This report, including all attachments thereto, describes the results of ENSR's Phase II ESA conducted at the Will County Generating Station, which took place between October 15 and October 26, 1998. Many of the facts and conditions pertaining to this Phase II ESA are subject to change over time; accordingly, the evaluations and conclusions must be viewed within this context.

ENSR has performed this Phase II ESA in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. ENSR shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time this Phase II ESA was performed.

This report and all field data, notes, and laboratory test data (hereinafter collectively "Information") were prepared by ENSR solely for the benefit of ENSR's Client, ComEd. ENSR's Client may release this Information to third parties, who may use and rely upon the Information at their own discretion. However, any use of or reliance upon this Information by a party other than parties identified shall be solely at the risk of such third party and without legal recourse against ENSR, or its subsidiaries and affiliates, or their respective employees, officers or directors, regardless of whether the action in which recovery of damages is sought is based upon contract, tort (including the sole, concurrent or other negligence and strict liability of ENSR), statute or otherwise. This Information shall not be used or relied upon by a party which does not agree to be bound by the above statement.

2.0 INVESTIGATION METHODS

Prior to initiation of field investigations, a site reconnaissance was performed during the Phase I ESA to define the study area. Field investigation activities were subsequently conducted to obtain site specific information and data pertaining to site geology and hydrogeology, groundwater quality, soil properties, and potential contaminant source(s).

The sampling locations were recommended based on the preliminary Phase I ESA findings. A sampling location summary listing is presented in **Table 1**. A summary of the identified potential areas of concern is presented below.

- 1. Ash Disposal Areas.** Three ash disposal areas are located on the southern portion of the facility. These areas are used to store ash prior to having it transported off-site. Two soil borings (B-1 and B-2) were advanced and one monitoring well (MW-1) was installed in the southeastern ash disposal area. Two soil borings were (B-3 and B-4) were advanced in the southwestern ash disposal area. One surface soil sample (S-1) was collected in the western ash disposal area by the Ash Settling Ponds.
- 2. Stormwater Runoff Ponds.** There are 3 ponds at the facility which collect surface stormwater runoff. The ponds are located to the south of the main building and construction offices. One sediment sample (X-6) was collected from the pond located to the southwest of the construction offices. One sediment sample (X-7) was collected from the pond located to the south of the construction offices. One sediment sample (X-13) was collected from the pond located to the west of the construction offices.
- 3. Ash Settling Ponds.** There are 4 ponds at the facility which are used to collect ash wastewater. The ponds are located on the western portion of the facility. One sediment sample (X-3) was collected from the southern pond, and one sediment sample (X-4) was collected from the pond directly north of the southern pond. In addition, one soil boring (B-5) was advanced and one monitoring well (MW-2) was installed between these two southern ponds. One sediment sample (X-5) was collected from the northern pond. One sediment sample (X-8) was collected from the pond located to the north of the Sluice Water Pump Building.
- 4. Former Sulfur Dioxide Scrubber Ponds.** A former sulfur dioxide scrubber system was previously located in the southwestern corner of the facility. Two ponds associated with this former system are located to the south of the Ash Settling Ponds. One sediment sample (X-1) was collected from the western pond, and one sediment sample (X-2) was collected from the eastern pond.
- 5. Sluice Water Pumping Area.** A Sluice Water Pump Building and Sluice Water Retention Pond, which are used to recycle sluice water back into the system, are located to the north of the southern Ash Settling Ponds. One surface soil sample (S-24) was collected on the west side of the building, and one sediment sample (X-14) was collected

from the pond.

6. **Sewage Treatment Plant.** A Sewage Treatment Plant is located to the north of the northern Ash Settling Pond. One soil boring (B-6) was advanced.
7. **Coal Handling Equipment.** Coal is received at the facility via barges on the Chicago Sanitary & Ship Canal located on the eastern end of the facility. The coal is stored at the coal pile at the northeastern corner of the facility. One soil boring (B-7) was advanced at the Car Dumper, which is located to the northeast of the Sewage Treatment Plant. One soil boring (B-9) was advanced to the southwest of the coal pile beneath an overhead conveyor from the Car Dumper. One surface soil sample (S-8) was collected at the Surge Hopper, which is located adjacent to the Chicago Sanitary & Ship Canal.
8. **Coal Pile Runoff Ponds/Ditches.** Two coal pile runoff ponds are located to the west of the coal pile. One sediment sample (X-9) was collected from the southern pond, and ~~one sediment sample (X-10) was collected from the northern pond. In addition, one soil boring (B-8) was advanced and one monitoring well (MW-3) was installed.~~ Two coal pile runoff ditches are also located to the west of the coal pile. One sediment sample (X-11) was collected from the western ditch and one sediment sample (X-12) was collected from the eastern ditch.
9. **Demineralized Water Aboveground Storage Tanks.** Two aboveground storage tanks (ASTs), used for the storage of demineralized water, are located at the northwestern corner of the facility. One soil boring (B-18) was advanced.
10. **Materials Storage Areas.** There are four materials storage areas located at the facility. One storage area is located to the north of the Coal Handling Tractor Garage, which is south of the coal pile. The primary concern at this storage area was drum storage. One surface soil sample (S-5) was collected and one soil boring (B-11) was installed. The second storage area is located near the southeast corner of the Switch Yard. The primary concern at this storage area was former drum storage. One soil boring (B-15) was advanced. The third storage area is located to the west of the Electric Shop, which is located on the west side of the main building. The primary concern at this storage area was drum storage. One soil boring (B-16) was advanced. The fourth storage area is located at the northeastern corner of the Switch Yard. The primary concern at this storage area was drum storage. One soil boring (B-17) was advanced and one surface soil sample (S-22) was collected.
11. **Oil/Water Separator.** One oil/water separator is located to the west of the main building and to the south of the fourth identified Materials Storage Area. One surface soil sample (S-21) was collected.
12. **Transformers.** Transformers with oil staining were observed throughout the facility. Soil samples were collected in 5 locations with the most significant staining. The first location contains the transformers on the west side of the Wastewater Treatment Plant,

which is located to the south of the coal runoff ponds. One surface soil sample (S-2) was collected. The second location contains the transformers on the north side of the Breaker House, which is located to the south of the coal pile. One surface soil sample (S-6) was collected. The third location contains the transformers to the north of the northern Crib House, which is located to the east of the main building. Two surface soil samples (S-9 and S-10) were collected. The fourth location contains the transformers to the south of the northern Crib House. One surface soil sample (S-11) was collected. The fifth location contains the transformers to the south of the Electric Shop, which is on the west side of the main building. Three surface soil samples (S-18 through S-20) were collected.

-
- 13. **Chimneys/Precipitators.** Two chimney units are located on the east side of the main building. Surface staining from the precipitator equipment was observed. Five surface soil samples (S-12 through S-16) were collected. In addition, one soil boring (B-13) was advanced and one monitoring well (MW-4) was installed to the south of the southern chimney.
 - 14. **Gasoline Underground Storage Tank.** One 1,500 gallon underground storage tank (UST) is located at the northeast corner of the main building. This UST is used for the storage of gasoline. One soil boring (B-12) was advanced.
 - 15. **Petroleum ASTs.** There are six ASTs located at the facility, which are used for the storage of petroleum products. Two of these ASTs have capacities of 12,500 gallons and are used for the storage of ignition fuel, and the third AST has a 15,000 gallon capacity is used for the storage of diesel fuel. A diesel fuel dispenser system is also located adjacent to these ASTs. One soil boring (B-10) was advanced and one monitoring well (MW-5) was installed. In addition, two surface samples (S-3 and S-4) were collected adjacent to the diesel fuel dispenser system. Two diesel ASTs are located to the west of the construction offices. One soil boring (B-14) was advanced and one surface soil sample (S-17) was collected. One diesel AST is located at the Emergency Diesel Generator Building, which is located to the south of the coal pile. One surface soil sample (S-7) was collected.

2.1 Sampling Methods

All soil (surface and subsurface), sediment, and groundwater samples collected were submitted for analysis of BTEX and PNA constituents using EPA Methods 8260 and 8310, respectively, PCBs using EPA Method 8081, RCRA metals using EPA Method series 6000 and 7000, and pH by EPA Method 9045. In addition, surface soil and sediment samples were submitted for TPH using EPA Method 8015. A sample summary listing is presented in **Table 1**.

The sample glassware used to contain the samples retained for laboratory analysis were provided pre-cleaned from National Environmental Laboratories, Inc. (NET) of Bartlett, Illinois. Each sample was labeled with the project number, project location, client, sample number, sample depth, date, time, and requested analysis. The soil samples were stored on ice in the

field in a cooler and shipped via courier under chain-of-custody to NET. Standard chain-of-custody procedures were maintained from the time of sample collection until delivery to the analytical laboratory.

2.1.1 Sediment Sampling

Fourteen sediment samples (X-1 through X-14) were collected at the facility. The sediment sample locations are illustrated on **Figure 3**. Sediment samples were collected using a stainless steel hand shovel. All sampling equipment was decontaminated between each sediment sample location using the procedure outlined in **Section 2.3**.

2.1.2 Surface Soil Sampling

Twenty-three surface soil samples (S-1 through S-22 and S-24) were collected at the facility. The surface soil sample locations are illustrated on **Figure 4**. Surface soil samples were collected using a stainless steel hand shovel. All sampling equipment was decontaminated between each sediment sample location using the procedure outlined in Section 2.3.

2.1.3 Soil Borings and Subsurface Soil Sampling

Eighteen soil borings (B-1 through B-18) were advanced at the facility. The soil borings locations are illustrated on **Figure 5**. The soil borings were advanced by Fox Drilling, Inc. (Fox) of Itasca, Illinois, utilizing Geoprobe direct-push drilling techniques. The soil borings were advanced to a maximum depth of 3 feet below grade. All soil borings were backfilled with soil cuttings, and completed at surface grade with the appropriate material (i.e., concrete, asphalt). All sampling equipment was decontaminated between each soil boring location using the procedure outlined in **Section 2.3**.

Soil samples were collected by advancing by a hydraulically-driven stainless steel pre-probe. Soil samples were collected using a 2.0-inch diameter acetate lined soil sampler. Soil samples were continuously collected from the surface to the bottom of the soil borings. The soil samples were visually inspected and field classified using the general guidelines of the Unified Soil Classification System (USCS) and the American Society for Testing and Materials (ASTM) Test Method ASTM D2488 for soil classification.

Each soil sample was field screened for the presence of VOCs using a photoionization detector (PID) and standard headspace screening methods. The PID readings indicate relative levels of VOCs in the vapor headspace, but do not represent actual concentrations which may exist in the soil. The PID has a detection range of 1.0 part per million volume (ppmv) to 2,500 ppmv. The soil sample which exhibited the highest PID reading, or if no PID readings were detected, from directly above the field-interpreted groundwater level, was retained from each boring for laboratory analysis.

2.1.4 Monitoring Wells and Groundwater Sampling

Five monitoring wells (MW-1 through MW-5) were installed at the facility. The monitoring well locations are illustrated on **Figure 5**. The monitoring wells were installed by Fox utilizing hollow-stem augers and rotary drilling techniques. When bedrock was encountered, the monitoring wells were completed using rotary wash rock coring techniques. The monitoring wells were installed to a maximum depth of 12 feet below grade. Fluids generated during monitoring well installation and groundwater sampling were discharged to the ground surface in proximity to each sampling location. All sampling equipment was decontaminated between each soil boring location using the procedure outlined in **Section 2.3**.

The monitoring wells were installed through the working space within hollow stem augers. The monitoring wells were constructed of 2-inch diameter Schedule 40 PVC 0.010-inch slotted continuous wrap well screen and solid riser. A filter pack consisting of clean silica sand was placed surrounding the well screen to filter out fine soil particles from the formation adjacent to the screen. The filter pack extends from the bottom of the soil boring to approximately 1-foot above the top of the well screen. A bentonite pellet seal was placed on top of the sand pack and hydrated with distilled water to prevent surface water infiltration. The annular space above the bentonite seal was filled with a neat bentonite and cement grout to approximately 6-inches below grade. The monitoring wells were completed at grade and an 8-inch diameter steel protective road box was placed over each monitoring well and set in concrete at grade. The monitoring wells were capped with expandable well caps and equipped with locks to prevent unauthorized access. A monitoring well construction diagram is included in **Appendix A**.

After the installation of the monitoring wells, approximately three to five well volumes of groundwater was removed from each monitoring well, or until the groundwater was relatively free from sediment, using a peristaltic pump. One groundwater sample was collected from each monitoring well and submitted for laboratory analysis. In addition, water quality field parameters consisting of pH, specific conductivity, and temperature were measured and recorded during sample collection.

2.2 Monitoring Well Gauging and Survey

Each monitoring well was gauged using an electronic interface probe in order to determine the presence or absence of liquid-phase hydrocarbons (LPHCs) and depth to groundwater. In addition, each monitoring well's top of casing and ground surface location was surveyed relative to an arbitrary benchmark assigned an elevation of 100 feet.

2.3 Equipment Decontamination

The drill rig and associated tooling, and sampling equipment were decontaminated prior to mobilization and before leaving the site. To minimize the potential for cross-

contamination, drilling and sampling equipment were decontaminated between each use. Decontamination of drilling equipment consisted of steam cleaning. Sampling equipment, including split spoons and stainless steel sampling equipment, were decontaminated before each use by washing with a solution of Alconox (phosphate based detergent) and potable water, and rinsing with distilled water. Decontamination fluids generated during equipment decontamination were discharged to the ground surface in proximity to each sampling location.

3.0 INVESTIGATION FINDINGS

The findings of the subsurface investigation, soil and groundwater sampling, monitoring well gauging, survey, and chemical analysis, are presented below. Analytical results are summarized in **Table 2** through **Table 5**. The analytical reports and chain-of-custody forms are included in **Appendix B**.

Analytical results were compared against the cleanup objectives as presented in 35 Illinois Administrative Code (IAC) Section 742.Appendix B: Table B-Tier 1 Soil Remediation Objectives for Commercial/Industrial Properties, and 35 IAC Section 742.Appendix B: Table E-Tier 1 Groundwater Remediation Objectives for the Direct Ingestion of Groundwater Portion of the Groundwater Ingestion Route.

~~Soil analytical results for the RCRA metals are shown as totals. Therefore, the soil component of the groundwater ingestion exposure route has not been considered. In addition, the groundwater beneath the site is classified as Class I, therefore the Class I baseline was used.~~

3.1 Sediment

BTEX. The analytical results indicated that BTEX constituents were not detected above the laboratory method detection limits.

TPH. The analytical results indicated that TPH as diesel was detected at concentrations ranging from 475 milligrams per kilogram (mg/kg) in sample X-12 to 16,700 mg/kg in sample X-11. TPH as oil was detected at concentrations of 434 mg/kg in sample X-8 and 2,750 mg/kg in sample X-7. However, cleanup objectives for TPH have not been established by the IEPA. TPH as gasoline was not detected above the laboratory method detection limits.

PNAs. The analytical results indicated that benzo(a)anthracene, benzo(a)pyrene, and benzo(b)fluoranthene were detected in samples X-9 and X-12 at concentrations above the IEPA cleanup objectives. It should be noted that samples X-9, X-11, and X-12 had elevated detection limits due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives. Refer to **Table 2** for PNA results.

PCBs. The analytical results indicated that PCBs were detected in the sediment samples collected. However, these concentrations were not above the IEPA cleanup objective of 1.0 mg/kg.

Metals. The analytical results indicated that arsenic, chromium, and lead were detected at concentrations above the IEPA cleanup objective of 3 mg/kg, 420 mg/kg, and 400 mg/kg, respectively. Arsenic was detected at concentrations ranging from 3.4 mg/kg in sample X-6 to 24 mg/kg in sample X-1. However, the concentrations of arsenic are within the range of arsenic

(0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992. Chromium and lead were detected in sample X-9 at a concentration of 680 mg/kg and 874 mg/kg, respectively.

pH. pH values ranged from 7.32 in sample X-7 to 10.22 in sample X-4.

Analytical results are summarized in **Table 2**, and sampling locations are illustrated on **Figure 3**. The analytical report and chain-of-custody forms are included in **Appendix B**.

3.2 Surface Soil

BTEX. The analytical results indicated that BTEX constituents were detected in the surface soil samples collected. However, these concentrations were not above the IEPA cleanup objectives.

TPH. The analytical results indicated that TPH as gasoline was detected at concentrations ranging from 224 mg/kg in sample S-15 to 292 mg/kg in sample S-14, and TPH as diesel was detected at concentrations ranging from 1,090 mg/kg in sample S-10 to 188,000 mg/kg in sample S-4. TPH as oil was detected at concentrations ranging from 110 mg/kg in sample S-1 to 933,000 mg/kg in sample S-5. However, cleanup objectives for TPH have not been established by the IEPA.

PNAs. The analytical results indicated that benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-c,d)pyrene were detected in samples S-5, S-9 through S-12, S-14 through S-16, S-18 through S-20, and S-22 at concentrations above the IEPA cleanup objectives. It should be noted that samples S-1 through S-8, S-13, and S-17 through S-19 had elevated detection limits due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo (a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives. Refer to **Table 3** for PNA results.

PCBs. The analytical results indicated that PCBs were detected at concentrations above the IEPA cleanup objective of 1.0 mg/kg. These concentrations ranged from 1.48 mg/kg in sample S-6 to 7.52 mg/kg in sample S-2.

Metals. The analytical results indicated that arsenic and lead were detected at concentrations above the IEPA cleanup objectives of 3 mg/kg and 400 mg/kg, respectively. Arsenic was detected at concentrations ranging from 3.8 mg/kg in sample S-17 to 23 mg/kg in sample S-18. However, the concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992. Lead was detected at concentrations ranging from 496 mg/kg in sample S-16 to 1,130 mg/kg in sample S-8 and S-10.

pH. pH values ranged from 5.78 in sample S-2 to 9.94 in sample S-3.

Analytical results are summarized in **Table 3**, and sampling locations are illustrated on **Figure 4**. The analytical report and chain-of-custody forms are included in **Appendix B**.

3.3 Subsurface Soil

Bedrock was encountered at approximately 1 foot to 3 feet below grade. Fill material, consisting of coal ash and gravel, was the primary material encountered above the bedrock. Native soil was encountered in B-18 and consisted of a light brown silty clay to bedrock at 3 feet below grade. Soil boring logs are included in **Appendix A**.

The PID readings obtained from the soil samples collected ranged from 1.1 ppmv in B-5 (0 to 1 feet below grade) to 51.8 ppmv in B-10 (0 to 1 feet below grade). The PID field screening results are recorded on the boring logs in **Appendix A**.

BTEX. The analytical results indicated that BTEX constituents were detected in the subsurface soil samples collected. However, these concentrations were not above the IEPA cleanup objectives.

PNAs. The analytical results indicated that benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene were detected in B-2, B-12, B-13, and B-15 through B-17 at concentrations above the IEPA cleanup objectives. It should be noted that B-7, B-9 through B-11, B-13, and B-16 had elevated detection limits due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives. Refer to **Table 4** for PNA results.

PCBs. The analytical results indicated that PCBs were detected at concentrations above the IEPA cleanup objective of 1.0 mg/kg. These concentrations ranged from 1.1 mg/kg in B-1 to 41.3 mg/kg in B-11.

Metals. The analytical results indicated that arsenic was detected at concentrations above the IEPA cleanup objective of 3 mg/kg. Arsenic was detected at concentrations ranging from 3.9 mg/kg in B-11 to 11 mg/kg in B-17. However, the concentrations of arsenic are within the range of arsenic (0.35 mg/kg to 24 mg/kg) detected by the EPA during a state wide soil survey in 1992.

pH. pH values ranged from 7.79 in B-9 to 9.44 in B-8.

Analytical results are summarized in **Table 4**, and soil boring locations are illustrated on **Figure 5**. The analytical report and chain-of-custody forms are included in **Appendix B**.

3.4 Groundwater

The groundwater elevations ranged from 3.6 feet in MW-3 to 8.95 feet in MW-4. LPHC was not detected in any of the monitoring wells. However, emulsified oil droplets and an oil sheen were

encountered in MW-5 during groundwater sampling activities. Based on the gauging data, the apparent groundwater flow direction beneath the facility has been calculated to be to the east (**Figure 6, Groundwater Elevation Map**). Monitoring well gauging data is included in **Appendix C**.

Water quality field parameters consisting of pH, specific conductivity, and temperature were measured. The recorded measurements are summarized in **Table 5**.

BTEX. The analytical results indicated that benzene was detected at a concentration above the IEPA cleanup objective of 0.005 milligrams per liter (mg/l) in MW-5. Benzene was detected at a concentration of 0.031 mg/l.

PNAs. The analytical results indicated that naphthalene was detected at a concentration above the IEPA cleanup objective of 0.025 mg/l in MW-5. Naphthalene was detected at a concentration of 0.46 mg/l. It should be noted that MW-5 had an elevated detection limit due to matrix interference. These elevated detection limits are above the cleanup objectives for benzo(a)anthracene, benzo(b)fluoranthene, chrysene, and pyrene, and consequently, there is a possibility that the concentrations are actually above the cleanup objectives.

PCBs. The analytical results indicated that PCBs were not detected above the laboratory method detection limits.

Metals. The analytical results indicated that lead was detected at a concentration above the IEPA cleanup objective of 0.0075 milligrams per liter (mg/l). Lead was detected at a concentration of 0.0148 mg/l in MW-2. It should be noted that laboratory detection limit for cadmium was at 0.01 mg/l which is above the cleanup objective of 0.005 mg/l. Consequently, there is a possibility that the concentrations are actually above the cleanup objective.

Analytical results are summarized in **Table 5**, and monitoring well locations are illustrated on **Figure 5**. The analytical report and chain-of-custody forms are included in **Appendix B**.

4.0 DATA ASSESSMENT

4.1 Extent of Contamination

Based on the results of the subsurface investigation conducted, the following determinations and assessments were made regarding the extent of contamination at the facility. The following conclusions are subject to the Limitations presented in **Section 1.4**. In addition, although arsenic was detected above the IEPA cleanup objective, the concentrations of arsenic are within the range of arsenic detected by the EPA during a state wide soil survey in 1992. However, it should be noted that soil analytical results for the RCRA metals are shown as totals. Therefore, the soil component of the groundwater ingestion exposure route has not been considered.

4.1.1 Sediment

Arsenic, chromium, lead, and PNA constituents listed as benzo(a)anthracene, benzo(a)pyrene, and benzo(b)fluoranthene, were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Coal Pile Runoff Ponds.** The southern pond located west of the coal pile (X-9).
- **Coal Pile Runoff Ditches.** The western ditch located west of the coal pile (X-12).

It should be noted that due to matrix interference in samples X-9, X-11, and X-12, benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene had elevated detection limits. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives. These samples were collected from the southern coal pile runoff pond (X-9), the eastern coal pile runoff ditch (X-11), and the western coal pile runoff ditch (X-12).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 24 mg/kg in the following locations:

- **Former Sulfur Dioxide Scrubber Ponds.** The western Former Sulfur Dioxide Scrubber Pond (X-1).
- **Ash Settling Ponds.** The three Ash Settling Ponds (X-3 through X-4) located south of the Sluice Water Pump Building and the one Ash Settling Pond (X-8) located north of the Sluice Water Pump Building.
- **Stormwater Runoff Ponds.** The Stormwater Runoff Ponds (X-6 and X-7) located south and southwest of the construction offices.
- **Coal Pile Runoff Ponds.** The southern pond located west of the coal pile (X-9) and the northern pond (X-10). It should be noted that chromium and lead were also

detected above the IEPA cleanup objectives of 420 mg/kg and 400 mg/kg, respectively, in this area (X-10) at a maximum concentration of 680 mg/kg and 874 mg/kg, respectively.

- **Sluice Water Pumping Area.** The pond located at the Sluice Water Pumping Building (X-14).

4.1.2 Surface Soil

Arsenic, lead, PCBs, and PNA constituents listed as benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-c,d)pyrene, were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Materials Storage Areas.** Storage area located to the north of the Coal Handling Tractor Garage (S-5).
- **Transformers.** Transformers to the north of the northern Crib House (S-9 and S-10), transformers to the south of the northern Crib House (S-11), and transformers to the south of the Electric Shop, which is on the west side of the main building (S-18 through S-20).
- **Chimney/Precipitators.** Chimney unit located on the east side of the main building (S-12, and S-14 through S-16).

It should be noted that due to matrix interference in samples S-1 through S-8, S-13, and S-17 through S-19, benzo (a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene had elevated detection limits. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives. These samples were collected from the Ash Disposal Area (S-1), transformers located on the west side of the Wastewater Treatment Plant (S-2), diesel AST dispenser system on the south side of the coal pile (S-3 and S-4), storage area north of the Coal Handling Tractor Garage (S-5), Emergency Diesel Generator Building (S-7), Surge Hopper (S-8), chimneys/precipitators (S-13), diesel ASTs located west of the construction offices (S-17), transformers to the south of the Electric Shop on the west side of the main building (S-18 and S-19).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 23 mg/kg in the following locations:

- **Ash Disposal Areas.** Western ash disposal area by the Ash Settling Ponds (S-1).
- **Transformers.** Transformers to the north of the northern Crib House (S-10), transformers to the south of the northern Crib House (S-11), and transformers to the south of the Electric Shop, which is on the west side of the main building (S-18 and S-20).
- **Chimney/Precipitators.** Chimney unit located on the east side of the main building (S-12 through S-16).

- **Petroleum ASTs.** Diesel ASTs located west of the construction offices (S-17).
- **Oil/Water Separator.** Oil/water separator is located to the west of the main building (S-21).
- **Materials Storage Areas.** Storage area is located at the northeastern corner of the Switch Yard. (S-22).

Lead was detected above the IEPA cleanup objective, at a maximum concentration of 1,130 mg/kg in the following locations:

- **Coal Handling Equipment.** Surge Hopper located adjacent to the Chicago Sanitary & Ship Canal (S-8).
- **Transformers.** Transformers to the north of the northern Crib House (S-10) and transformers to the south of the Electric Shop, which is on the west side of the main building (S-20).
- **Chimney/Precipitators.** Chimney unit located on the east side of the main building (S-14 and S-16).

PCBs were detected above the IEPA cleanup objective in the following locations:

- **Transformers.** Transformers located on the west side of the Wastewater Treatment Plant (S-2), transformers on the north side of the Breaker House, which is located to the south of the coal pile (S-6), and transformers to the south of the Electric Shop, which is on the west side of the main building (S-18).

It should be noted that due to matrix interference, samples S-5 and S-19 had elevated detection limits. Consequently, there is a possibility that PCB concentrations are actually above the cleanup objective of 1.0 mg/kg. These samples were collected from the storage area north of the Coal Handling Tractor Garage (S-5) and the transformers to the south of the Electric Shop on the west side of the main building (S-19).

4.1.3 Subsurface Soil

Arsenic, PCBs, and PNA constituents listed as benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene, were the constituents of concern detected at concentrations above the IEPA cleanup objectives.

PNA constituents were detected above the IEPA cleanup objectives in the following locations:

- **Ash Disposal Areas.** The southeastern ash disposal area (B-2).
- **Gasoline UST.** The gasoline UST system (B-12).
- **Chimneys/Precipitators.** South of the southern chimney (B-13).
- **Materials Storage Areas.** The storage area located near the southeast corner of the Switch Yard (B-15), the storage area located west of the Electric Shop (B-16), and the storage area located at the northeastern corner of the Switch Yard (B-17).

It should be noted that due to matrix interference in samples B-7, B-9 through B-11, B-13, and B-16, benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene had elevated detection limits. Consequently, there is a possibility that the concentrations are actually above the cleanup objectives. These samples were collected from the Car Dumper (B-7), beneath the overhead Car Dumper conveyor southwest of the coal pile (B-9), diesel fuel dispenser system south of the coal pile (B-10), storage area north of the Coal Handling Tractor Garage (B-11), south of the southern chimney (B-13), and storage area located west of the Electric Shop (B-16).

Arsenic was detected above the IEPA cleanup objective, at a maximum concentration of 11 mg/kg in the following locations:

- **Ash Disposal Areas.** The southeastern ash disposal area (B-1 and B-2) and the southwestern ash disposal area (B-3 and B-4).
- **Ash Settling Ponds.** ~~The Ash Settling Ponds south of the Sluice Water Pump Building (B-5).~~
- **Sewage Treatment Plant.** The Sewage Treatment Plant north of the northern Ash Settling Pond (B-6).
- **Coal Handling Equipment.** The Car Dumper (B-7) and beneath the overhead Car Dumper conveyor southwest of the coal pile (B-9).
- **Coal Pile Runoff Ponds.** The northern coal pile runoff pond (B-8).
- **Materials Storage Areas.** Storage area north of the Coal Handling Tractor Garage (B-11), the storage area located west of the Electric Shop (B-16), and the storage area located at the northeastern corner of the Switch Yard (B-17).
- **Gasoline UST.** The gasoline UST system (B-12).
- **Chimneys/Precipitators.** South of the southern chimney (B-13).
- **Demineralized Water ASTs.** The demineralized water ASTs at the northwestern corner of the facility (B-18).

PCBs were detected above the IEPA cleanup objective in the following locations:

- **Ash Disposal Areas.** The southeastern ash disposal area (B-1).
- **Coal Handling Equipment.** Beneath the overhead Car Dumper conveyor southwest of the coal pile (B-9).
- **Materials Storage Areas.** Storage area north of the Coal Handling Tractor Garage (B-11) and the storage area located west of the Electric Shop (B-16).

4.1.4 Groundwater

Lead, benzene, and naphthalene were the constituents of concern detected at concentrations above the IEPA cleanup objectives. In addition, emulsified oil droplets and an oil sheen were encountered in MW-5 during groundwater sampling activities.

Benzene and naphthalene were detected above the IEPA cleanup objectives in the following locations:

- **Petroleum ASTs.** Diesel AST and dispenser system south of the coal pile (MW-5).

Lead was detected above the IEPA cleanup objective, at a maximum concentration of 0.0148 mg/l in the following locations:

- **Ash Settling Ponds.** The three Ash Settling Ponds located south of the Sluice Water Pump Building (MW-2).

It should be noted that laboratory detection limit for cadmium was at 0.01 mg/l which is above the cleanup objective of 0.005 mg/l. Consequently, there is a possibility that the concentrations are actually above the cleanup objective.

4.2 Potential Contaminant Exposure Pathways

Based on the above-referenced assessment, potential exposure pathways by which humans may be exposed to the constituents of concern have been identified at the facility. Potential sources, fate and transport mechanisms, and exposure media were considered in determining these potential exposure pathways. An identified potential exposure pathway does not imply that exposure is occurring, only that the potential exists for exposure.

4.2.1 Soil Ingestion

The soil ingestion pathway includes the first three feet within ground surface. Therefore, based on the analytical results, soil ingestion is a potential contaminant exposure pathway. Soil ingestion occurs when soil containing elevated concentrations of the constituents of concern are ingested into the body. The facility is an industrial site and direct contact and ultimately ingestion of the impacted soil is not likely to occur. However, construction activities would increase the possibility of exposure. Therefore, this pathway would need to allow for protection/prevention for the construction worker scenario.

4.2.2 Soil Inhalation

The soil inhalation pathway includes the first ten feet within ground surface. However, bedrock was encountered at approximately 4 feet below grade. Therefore, based on the analytical results, soil inhalation is a potential contaminant exposure pathway. Soil inhalation occurs when elevated concentrations of the constituents of concern are inhaled into the body. However, the highly volatile constituents (i.e., BTEX, TPH as gasoline), were not detected at concentrations above the IEPA cleanup objectives. The constituents that were detected at concentrations above the IEPA cleanup objectives (i.e., metals, semi-volatiles, PCBs), are not considered highly volatile. Based on the relatively low volatility of the detected constituents of concern, this pathway would not likely be an effective exposure pathway.

4.2.3 Groundwater Ingestion

The groundwater ingestion pathway includes groundwater being used as a potable source of water. The Village of Romeoville receives its potable water via 10 municipal potable water supply wells. Based on the facility's location immediately adjacent to two bodies of water, it is unlikely that the impacted groundwater beneath the facility would have any impact on these wells.

Based on the current land use (industrial) and site conditions (analytical results and soil types), it is judged that the potential for human exposure to the constituents of concern from this facility is low. However, personnel working at the facility could be susceptible to exposure due to accidental soil ingestion due to activities such as construction. Such exposure may result from contact with contaminated subsurface or surface materials previously located beneath a protective barrier (i.e., concrete cap, building). Additionally, emulsified oil droplets and an oil sheen were encountered in MW-5 during groundwater sampling activities.

There is no requirement under Illinois environmental law to further investigate or remediate this property.

Notes:

BTEX was analyzed using EPA Method 8260.

PNAs were analyzed using EPA Method 8310.

PCBs were analyzed using EPA Method 8081.

RCRA metals were analyzed using EPA Method series 6000 and 7000.

pH was measured using EPA Method 9045.

⁽¹⁾ Sampling locations are referenced in the Phase II Environmental Site Assessment Report in Section 2.0.

Notes:

Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties.

^(a) NA indicates not applicable, cleanup objectives have not been established for these parameters

^a Results are shown as totals, therefore the soil component of the groundwater ingestion exposure route has not been considered

Notes:

Cleanup objectives were derived from Illinois Environmental Protection Agency Section 742 Appendix B-Table B: Tier 1 Soil Remediation Objectives for Industrial/Commercial Properties.

⁽¹⁾ NA indicates not applicable, cleanup objectives have not been established for these parameters.

⁽²⁾ Results are shown as totals, therefore the soil component of the ground/water ingestion exposure route has not been considered.

NOTE: Spikes and Duplicates may not be samples from this job.

RPD - Relative Percent Difference

Advisory Control Limits for Duplicates - RPD should be less than 20.

NET Midwest, Bartlett Division

KEY TO ABBREVIATIONS and METHOD REFERENCES

- < : Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value.
- mg/L : Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm).
- ug/g : Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg.
- ug/L : Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb).
- ug/Kg : Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb).
- TCLP : These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test.
- Surrogate : These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements.
- % : Percent; To convert ppm to %, divide the result by 10,000.
To convert % to ppm, multiply the result by 10,000.
- ICP : Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy.
- AA : Indicates analysis was performed using Atomic Absorption Spectroscopy.
- GFAA : Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy.
- PQL : Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions.

499086	X-13	10/20/1998	10/21/1998

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Matrix Spike Samples may not be samples from this job.

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike

MSD = Matrix Spike Duplicate

RPD = Relative Percent Difference

RPD calculations are performed on the Percent Recovery calculated from the observed Matrix spike and Matrix Spike Duplicate results.

NOTE: Matrix Spike Samples may not be samples from this job.											

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike

MSD = Matrix Spike Duplicate

RPD = Relative Percent Difference

RPD calculations are performed on the Percent Recovery calculated from the observed Matrix spike and Matrix Spike Duplicate results.

KEY TO ABBREVIATIONS and METHOD REFERENCES

- < : Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value.
- mg/L : Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm).
- ug/g : Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg.
- ug/L : Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb).
- ug/Kg : Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb).
- TCLP : These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test.
- Surr: : These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements.
- % : Percent; To convert ppm to %, divide the result by 10,000.
To convert % to ppm, multiply the result by 10,000.
- ICP : Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy.
- AA : Indicates analysis was performed using Atomic Absorption Spectroscopy.
- GFAA : Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy.
- PQL : Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions.

Enclosed is the Analytical and Quality Control reports for the following samples submitted to Bartlett Division of NET, Inc. for analysis.

Project Description: ComEd-Will County 1801-230

Sample Number	Sample Description	Date Taken	Date Received
499952	MW-1	10/26/1998	10/27/1998
499953	MW-2	10/26/1998	10/27/1998
499954	MW-3	10/26/1998	10/27/1998
499955	MW-4	10/26/1998	10/27/1998
499956	MW-5	10/26/1998	10/27/1998

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Matrix Spike Samples may not be samples from this job.

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike

MSD = Matrix Spike Duplicate

RPD = Relative Percent Difference

RPD calculations are performed on the Percent Recovery calculated from the observed Matrix spike and Matrix Spike Duplicate results.

NET Midwest, Bartlett Division

KEY TO ABBREVIATIONS and METHOD REFERENCES

- < : Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value.
- mg/L : Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm).
- ug/g : Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg.
- ug/L : Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb).
- ug/Kg : Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb).
- TCLP : These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test.
- Surrogate: : These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements.
- % : Percent; To convert ppm to %, divide the result by 10,000.
To convert % to ppm, multiply the result by 10,000.
- ICP : Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy.
- AA : Indicates analysis was performed using Atomic Absorption Spectroscopy.
- GFAA : Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy.
- PQL : Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions.

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

Enclosed is the Analytical and Quality Control reports for the following samples submitted to Bartlett Division of NET, Inc. for analysis.

Project Description: ComEd-Will County; 1801-023-610

Sample Number	Sample Description	Date Taken	Date Received
498420	B15 (0-1)	10/15/1998	10/15/1998
498421	B16 (0-1)	10/15/1998	10/15/1998
498422	B17 (0-1)	10/15/1998	10/15/1998
498423	B18	10/15/1998	10/15/1998

Sample analysis in support of the project referenced above has been completed and results are presented on the following pages. These results apply only to the samples analyzed. Reproduction of this report only in whole is permitted. Please refer to the enclosed "Key to Abbreviations" for definition of terms. Procedures used follow NET Standard Operating Procedures which reference the methods listed on your report. Should you have questions regarding procedures or results, please do not hesitate to call. NET has been pleased to provide these analytical services for you.

This Quality Control report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

NOTE: Matrix Spike Samples may not be samples from this job.

Advisory Control Limits for MS/MSDs:

For Inorganic Parameters and GC Volatiles, the spike recovery should be 75 - 125% if the spike added value was greater than or equal to one fourth of the sample result value. If not, the control limits are not established. The RPD for the MS/MSD pair should be less than 20.

MS = Matrix Spike

MSD = Matrix Spike Duplicate

RPD = Relative Percent Difference

RPD calculations are performed on the Percent Recovery calculated from the observed Matrix spike and Matrix Spike Duplicate results.

KEY TO ABBREVIATIONS and METHOD REFERENCES

<	: Less than; When appearing in the results column indicates the analyte was not detected at or above the reported value.
mg/L	: Concentration in units of milligrams of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per million (ppm).
ug/g	: Concentration in units of micrograms of analyte per gram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per million (ppm) or mg/Kg.
ug/L	: Concentration in units of micrograms of analyte per liter of sample. Measurement used for aqueous samples. Can also be expressed as parts per billion (ppb).
ug/Kg	: Concentration in units of micrograms of analyte per kilogram of sample. Measurement used for non-aqueous samples. Can also be expressed as parts per billion (ppb).
TCLP	: These initials appearing in front of an analyte name indicate that the Toxicity Characteristic Leaching Procedure (TCLP) was performed for this test.
Surr:	: These initials are the abbreviation for surrogate. Surrogates are compounds that are chemically similar to the compounds of interest. They are part of the method quality control requirements.
%	: Percent; To convert ppm to %, divide the result by 10,000. To convert % to ppm, multiply the result by 10,000.
ICP	: Indicates analysis was performed using Inductively Coupled Plasma Spectroscopy.
AA	: Indicates analysis was performed using Atomic Absorption Spectroscopy.
GFAA	: Indicates analysis was performed using Graphite Furnace Atomic Absorption Spectroscopy.
PQL	: Practical Quantitation Limit; the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions.
